War is not, in modern times at least, the spontaneous impulse of a people who say, "Come let us fight a neighbor nation." The people are not naturally volunteer fighters. Great as have been some of the advances won through war, the war itself was not the willing service of all the men who fought it. Were it not for the most extreme pressure exerted upon men of fighting age, even the cause of American Independence would not have commanded enough voluntary soldier-service to win it, and the Union was saved by Lincoln eventually having recourse to conscription. Rightly or wrongly, the plain people do not relish battle, and wounds, and violent death. There are always, it is true, men of intrepid spirit who readily and willingly volunteer at the outset and do so out of an idealism which commands universal honor, but wars are not carried on and concluded by such men—there are not a sufficient number of them.

It is easy, far too easy, for the mind searching the causes of war to lose itself in the labyrinth of secondary causes. The things that are seen, the things that are printed for everyone to read, never fully represent the inwardness of the true cause of war. Why, such is the character of war that a nation cannot be trusted with the whole truth of what transpires after a war is begun—secrecy as to the cause of it and secrecy regarding the progress of it are essential. The truth of any war is never known until long after the men who bear the personal responsibility for it are dead; and if there are any other elements, such as close racial connections between the real warmakers, that is never made known, because it is, or is supposed to be, the exclusive knowledge of the world's invisible super-government.

Nations are made to froth at the mouth and march the streets of their cities calling for war. Yes, but why? Because they have been lied to. And who has lied to them? The German people were told that their country was invaded. The French were told that their country was invaded. Neither country was invaded at the time the stories were told. Even the Turks cannot be raised to war unless they are told their country is invaded. The propaganda must be brought into play before the people can be worked into the war mood. And it is because the people have so frequently discovered afterward that they were misled as to the facts, that the present suspicion of government exercises such sway upon their minds.

First there is the world checkerboard on which a few men are playing their game for world stakes in wealth and world stakes in power. These men are comparatively few. They own and control most of the raw material consumed in war. They own and control the bases of the money of the nations. They own and control certain industries that cannot live without an occasional war to use up their surplus and boost the exorbitant scale of prices. They are the holders of humanity's heritage in natural resources; they are the controllers of humanity's vehicle of exchange in money: by devious ways, best known to these super-families through twenty generations, they enmesh, capture and command the weak men who make up the majority of the governments.

Now, these men who play the big game are first to be reckoned with. They are to be named by name, their activities are to be traced bit by bit, the hidden rulers of the world are to be unmasked and then—and then there will be no more war!

A very small prison, capable of holding fifty or sixty men, would bring together and put in restraint all the men who are responsible for war, who could now start the war all over again.

When a peace prize is offered for the exposure of the individual originators of war, something will be accomplished. Until then, nothing. The League of Nations will never be as potent as this league of fifty or sixty international financiers.

These facts can be found by working back and back and back through the circumstances of every war, by tabulating those who are found on both sides of the war and on both sides of the peace, who hold conferences in neutral countries, and who win equally rich rewards out of defeat as out of victory. They are the true red international.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Teapot Dome and Muscle Shoals

THE country welcomed the prompt assurance from the White House that the President would counsel action in the matter of the Teapot Dome oil lease. An appalling amount of loose conduct has been revealed at Washington during the past three years, in addition to the now untraceable mass of corruption which existed during the war. It is reassuring to find that the President is not deterred by political considerations, but will push investigations even where the persons involved are members of his own party.

Enough has been ascertained to warrant one move on the part of the President, which is the recovery of the oil deposits so questionably turned over to private hands. The mystery is to account for their ever being turned over, even had the transaction been as free of suspicion as an angel's whisper. Here were supplies admittedly of use to the Navy, indispensable to the nation in time of war; yet three departments acquiesced in their passing into private control. In the Navy Department one of the officials was a former director of, and had a brother who was vice-president of the oil company acquiring the lease. In the Department of the Interior the official making the lease was a heavy borrower from oil men who were profiting by the lease. In such a state of affairs the plain citizen wonders what subtle degeneracy has crept into public life, as scandal follows scandal, involving men whose reputations should be worth more than any bribe that could be offered them.

It is not enough to expose the wrong that may have been done, and restore the rights of the United States; it is necessary that adequate checks should be set up to prevent recurrence of such irregularities in the public business. Three departments were involved, two of them ostensibly as checks on the first. Yet, the whole matter went through perfunctorily, with attendant disaster.

More than that, the rights of the United States in natural resources should be doubly safeguarded from this time forth. Compare Teapot Dome with Muscle Shoals. At Teapot Dome an exhaustible supply of oil was turned over to a private company to be exhausted, perhaps. It was turned over without delay, without much publicity, without organized objection.

At Muscle Shoals, nothing is exhaustible. The source of power continues as long as the rain rains and the river flows. All it needs is development—a development that cannot be moved away, and which remains the property of the government for all time. Yet this matter, which would materially add to the possessions of the United States, instead of subtracting from them, has been subjected to nearly three years' unwarranted delay, to a monumental propaganda of adverse publicity, and to the largest organization of financial opposition ever witnessed in Washington.

The government that cannot see the value of development of resources at Muscle Shoals did not gag for a moment at the exhaustion of resources at Teapot Dome.

Again, the comparison as it concerns the national defense. Teapot Dome was an essential source of oil for naval fuel. It was given up. Oil wells do not increase with use; their contents decrease. The effect of the lease was to leave less oil available to the United States Navy.

At Muscle Shoals is a great potential source of material for national defense. It is now useless. Its development would mean that a mighty defensive weapon would be placed in the hands of the United States Government at a moment's notice. The greater the development, the greater the reserve power of the United States. Muscle Shoals could only grow greater; it could not, like the oil wells, grow less. Yet, quick action on the wells; unparalleled delay on the Shoals.

The offer for Muscle Shoals was asked for by the government; no request was made for a bid on Teapot Dome; the offer for the oil property was born in the minds of those who coveted it.

The offer for Muscle Shoals, when made at government request, was at once released by the Secretary of War to competitive bidders, to stir them up, if possible, to prevent that source of power going to a man who would use it for the public benefit, and not to strengthen the hold of the "power ring" on the country. But was the Teapot Dome bid sent out among possible competitors? It was not.

And, besides, on Muscle Shoals, not a dollar was spent to entice the favor or stain the soul of a single man. The delay on Muscle Shoals is all right, IF it is caused by the government making doubly and trebly certain of its rights being protected and guaranteed. More of that kind of delay would have prevented the Teapot Dome scandal.

Filene and Bok

IT HAS previously been noted that pacifists confine their activities to the only two peoples who can be trusted not to break the peace, namely, the United States and Great Britain. Preaching of the doctrines of peace among the nations which still believe in war as the first method of settling differences, would be commendable.

This is the essential difference between the efforts of Mr. Bok and those of Mr. Filene. Mr. Bok (whose efforts, with or without his consent and knowledge, were made flagrantly subservient to League of Nations organized propaganda) confined his culture of the peace idea to the United States. Now the peace idea is indigenous to the United States, it is our native state of mind. It does not need to be carefully sown and nursed here.

On the other hand Mr. Filene reproduces the essential of the Bok idea in countries where war is still glorified and where preparations for the next war are already in progress. He seeks to plant the peace idea in places where it is not native to the national mind. This is both good psychology and practical service. If any considerable number of minds on the continent of Europe can be turned to consider the idea of peace, great will be the gain to the world at large.

We Can Do This for Europe

THERE is much that the United States can do for Europe, when Europe permits it. To date Europe only asks for money. Europe can do nothing with money except perpetuate the ruinous system which is responsible for her present plight. Money is the result, not the cause, of better ways of doing things. For example, there is no country in Europe today whose first care is its own people. In France and Germany the industrial philosophy is to use the people to produce what must be sold elsewhere, not to produce on such a scale as shall render the people themselves able to buy. German industrialists visiting the United States show themselves to be utterly impervious to the possibility and advantage of making the German people so prosperous through their own labors that they shall themselves become the purchasers of their products. A great German industrial magnate, when shown 5,000 automobiles parked outside a factory, confessed himself unable to mentally ascend to the thought of enabling the German workman to own his own car. French industrialists show like incapacity. The British are less dense to the idea but almost as much disinclined to the experiment. The European idea is an industrial class subsisting on the narrowest margin or no margin at all, while their products go to "foreign markets." It is the home market that measures a nation's prosperity.

In this field, which is the principal field in this day and generation, the United States could be of the greatest benefit to Europe, but this is precisely the benefit that Europe does not want, because in itself it would mean the disappearance of that peculiar form of inertia and slavery upon which a small class maintains a false and shameful superiority.

Mr. Hiram Johnson

MR. HIRAM JOHNSON was lately heard from in various parts of the country. But there was nowhere heard an echo of him after he left. The personally selected Presidential candidate of Albert D. Lasker is doing his best to live up to the advertising agent's notion of what a live political tour should be, but is palpably failing in impressiveness. Even if Mr. Lasker should rally the whole power of the American Jewish Committee to Mr. Johnson (or that part of it which Mr. Baruch fails to rally to Mr. McAdoo) there would still be something lacking in appeal to the American mind. As a "poor man," as Mr. Johnson delights to describe himself, he is in mighty poor company. Poor men should avoid as they would avoid a pestilence the favors of wealthy men who seldom invest without expectation of return.

The lack of frankness in Mr. Johnson was nowhere more apparent than in his Michigan address. Michigan is the home of Mr. Newberry whose election to the United States Senate was contested. Senator Johnson was not present when the vote was taken and was charged the length and breadth of the country with committing a deliberate act of evasion. He came to Michigan with that handicap, and in his speech referred to the Newberry matter numerous times, always linking it with the regret that he had "missed the train." But he was not frank enough to say how he would have voted had the train arrived, and he with it! After that, of course, Michigan promptly returned Mr. Johnson to the limbo from which his appearance had momentarily lifted him.

As "the Opposition" Mr. Johnson is pitiably ineffectual. Merely being "agin the government" is not a certificate of wisdom in American eyes. And merely being "for" something that will win votes by giving people money out of the Treasury, is not accepted as statesmanly vision. This is as far as Mr. Johnson goes.

If Mr. Johnson would take the train to Washington and get on the job to which the people of his state elected him, he would do all that is required of him now.

The remarkable reception given the Ramsay MacDonald labor government in Great Britain, the sympathy expressed for its aims and the good wishes for its success, bespeak as few events could the desperate pass to which public affairs in those islands had come. Here is what amounts to a revolution, not political but social, in which the "ruling classes" have definitely given over to the classes that heretofore were ruled, and this radical change has been effected, not by the exercise of force as under Mussolini in Italy, but by the peaceful mandate of the ballot of the British people, and is concurred in by noble, conservative and liberal alike. It testifies the confidence of Britishers in Britishers. Ramsay MacDonald may be anything he likes as a party leader, just now he is British premier, and his task is government, not propaganda. That he will address himself to this task, his countrymen do not doubt. The type of labor leadership is so high in Britain that there are none of the misgivings which would accompany elevation to power of the same relative ranks of labor leaders in this country.

The death of Lenin removes the philosopher of Bolshevism. He was a contradictory character bound into unity by a single driving purpose which weighed his career to the depths at times but at the end lifted him to the highest pinnacle of anarchic chaos ever imagined or witnessed in modern times. Most of the men who surrounded him were opportunists, like Trotsky, from the East Side of New York. Lenin's opportunism had some relation to the welfare of all the people. When the program of Communism was headed straight for ruin, when it had already inflicted on Russia more misery than a hundred wars and a thousand pestilences could have done, Lenin had courage enough to do a right-about-face, and do it frankly in full view and understanding of the people. Whether it was because he despised them, or because he trusted them, the critics will never agree. His march back toward sanity was halted, however, by his illness. The old fallacies were brought forward again. What will now become of Russia no one seems to know. Russia's deliverance will never come until the Russians themselves drive out the aliens who have held hell's carnival over them these deathful years.

Lincoln Sued for Ten Dollars on a Horse Trade

Three Times a Defendant in Lawsuits When He Was Desperately Poor

By JOHN DAVIS ANDERSON

WITHIN the last thirty years we have come to know more of Abraham Lincoln's personal life-history and to learn more of the man himself than might have been believed possible had historians been satisfied that all that was worth knowing about him was contained in "Abraham Lincoln, a History," by his secretaries, John G. Nicolay and John Hay.

The work of Nicolay and Hay proved a firm foundation, however, for much that has followed. After all, it is largely a documentary history. It was left for Miss Ida M. Tarbell, in her work, and to writers such as Jesse W. Weik, Frederick Trevor Hill, and many others, to give us interesting details and side events in the life of the most American of all Americans.

The much-praised "Abraham Lincoln," by Lord Charnwood, is a condensed life, but with no new facts nor new explorations into Lincoln's career. Much of it is a history of the times and Charnwood shows us in a splendidly written volume the picture of Lincoln growing from boyhood into manhood and from manhood into maturity, carried, as it might be expressed, "in favor with God and man."

One of the earlier writers about Lincoln said that he did not need praise and laudation; but to perpetuate his memory at its true worth, he did need friends — human beings capable of understanding Lincoln in all his phases; of comprehending the poor boy of the wilderness, the country clerk, the surveyor, the bashful young lawyer, the timid lover, the young frontiersman in politics and the man grown to the full stature of the politician and statesman combined.

Such is the Lincoln we should all strive to know. Perhaps the reason Nicolay and Hay's history does not contain any considerable amount of matter relating to the intimate Lincoln is due to the fact that they did not know very much of his history and life previous to the time of his nomination for the Presidency.

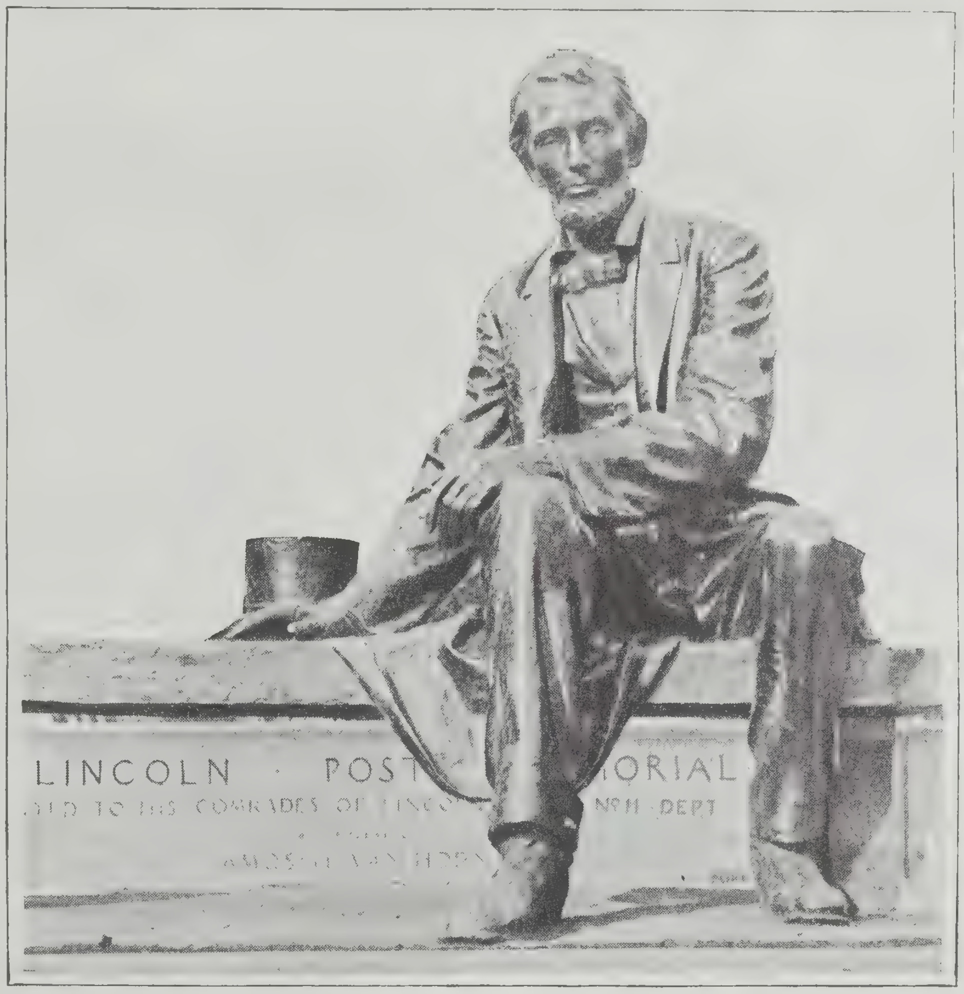
A room in the state capitol at Springfield had been turned over for Lincoln's use a few weeks after the Republican Convention at Chicago in 1860.

Nicolay, who was a young German newspaperman from Chicago and then out of a position, became Lincoln's secretary. Later, as the campaign progressed, Nicolay's duties became so arduous and his hours so long that the youthful John Hay became his assistant. Nicolay had been so satisfactory in his work that Lincoln took him to Washington as his secretary, and when he found that this position was taxing his strength and energy to the breaking point, he suggested to Mr. Lincoln that it might be well for Hay to come and assist him as he had done during the campaign.

These two men, from that time, lived at Lincoln's elbow. They were in the best possible position to collaborate in writing his history.

It has, however, been left mainly for others to write in fragmentary fashion the little biographical incidents which show the human side of Lincoln's life. No part of this is more interesting than that relating to the quarter of a century which forms the period of Lincoln's activity as a lawyer; the period from 1836, when he was admitted to practice, to 1860, when he was elected President. Portions of two years may be subtracted from this period as representing the term he served in Congress. The fact, of course, must not be overlooked that he was a member of the Illinois legislature for a number of years, but this office made no great demands upon his time. True, when he was first elected the state capital was at Vandalia, but largely through Lincoln's influence it was changed to Springfield, his home.

No man ever believed more thoroughly in the legal profession than Lincoln, and he had no patience with that type of individual who would sneer or smile cynically when the expression "honest lawyer" was used. He said on one occasion: *"Let no young man choosing the law for a calling yield to that popular belief. If in your judgment you cannot be an honest lawyer, resolve to be honest without being a lawyer. Choose some other occupation rather than one in the choosing of which you do, in advance, consent to be a knave."*



The Amos H. Van Horn statue by Borglum, placed on the Courthouse Plaza, Newark, New Jersey.

Few know, perhaps, that Lincoln personally was thrice a defendant in as many lawsuits. The first action, it is said, grew out of a horse trade. A man named Watkins had sold him a horse for fifty dollars. Watkins became impatient to have the balance, which amounted to ten dollars, and brought suit against Lincoln. The latter borrowed the money and paid the debt. This was at a period when Lincoln was desperately poor, in the New Salem days of his early manhood. He had needed the horse in connection with his work as a surveyor, and the temptation to go into debt for so large a sum, plus the impatience of Watkins, explains the transaction.

In 1834 a man named Van Bergen undertook to force the payment of a note for a considerable sum, which Lincoln & Berry had given in connection with their ill-fated grocery business at New Salem. Berry had died, and the Trent brothers, who had given notes to Lincoln & Berry and taken over the business, disappeared.

Lincoln had determined to pay the debts of the firm and made no defense to the suit brought by Van Bergen. He even turned over his horse and surveying instruments in part satisfaction of the judgment. When his friends in New Salem came to know of what they regarded as his rashness, they raised a sufficient sum of money to purchase back these instruments and made Lincoln a present of them. It cannot but be noted that in these two instances poverty was the sole reason for his being made the defendant.

The facts in the third instance are much more complicated, quite unknown, and form an interesting event in a much later period of his career. For the details we are indebted to William H. Townsend, of Lexington, Kentucky. A careful study of the case clearly indicates that spite formed the motive. The action was started by a petition in the circuit court of Fayette County, Kentucky, in 1853. The suit was that of Edward Oldham and Thomas Hemingway, the surviving partners of Oldham, Todd & Company, and the defendants were Abraham Lincoln, Ninian W. Edwards and George B. Kinkead. But let us go back a step that we may understand the circumstances surrounding this whole matter.

Mary Todd, Abraham Lincoln's wife, it will be remembered, was the daughter of Robert S. Todd, of Kentucky. He was engaged at Lexington in an extensive cotton industry and was a man of importance, force of character and considerable wealth. Oldham and Hemingway were his partners at the time of his death in 1849. Lincoln had married his daughter, Mary Todd, the wedding having taken place in 1842 at the Springfield home of Ninian W. Edwards, her brother-in-law, rather than at the Todd home in Lexington. Robert S. Todd had two other daughters besides Mrs. Lincoln and Mrs. Edwards: Frances Wallace and Ann Smith, both of whom lived in Springfield.

In the natural order of events steps were taken to settle the estate of Todd. He had left no will and his wife qualified as administratrix, but she seems to have been largely guided by Levi O. Todd, Lincoln's brother-in-law. The latter very diligently pressed claims for monies and demanded their deduction from the shares of his sisters, his claim being that his father had made advancements to them, and especially to Mary Todd Lincoln. It became known to Oldham and Hemingway in 1853 that Lincoln was possessed of about fifteen hundred dollars, then in the possession of George B. Kinkead, who held a power of attorney from Lincoln and who was an attorney, actively engaged in the practice of law in Lexington. The above-mentioned suit was started without any request to Lincoln to pay the money claimed to be due. The petition sets out that Lincoln had collected all but nine dollars of $472.54 which was claimed due from Edwards, and that during a visit to Kentucky several years previously the old firm of Oldham, Todd & Company had placed in Lincoln's hands for collection two claims for goods sold; one against H. E. Dummer, but known as the Blain, Thompkins & Barrett claim, and the other against Hawley & Edwards. The former was for $129.05 and the latter for $343.49. Kinkead had been made a defendant because he held money due Lincoln. Lincoln apparently saw the hand of his brother-in-law in the matter and drew an answer on his own behalf within a few hours of the time when he received the pleadings from Kinkead. Shortly thereafter he sent a letter to Kinkead urging him to compel the plaintiffs to file a statement of particulars. Lincoln was anxious to learn for a certainty who had impelled Hemingway to attach the affidavit to the petition as to the correctness of the claim. His belief was, and continued to be, that brother-in-law Levi was the responsible party, but matters took such a turn in the case that he never was able to prove this.

As the situation developed, Lincoln proved to the satisfaction of all concerned that he had never received the money from either of these claims; that fifty dollars on account of one of them had been secured by Lincoln's correspondent in another part of Illinois, five dollars deducted as the correspondent's fee and the forty-five dollars balance retained by Lincoln in accordance with an agreement with his father-in-law; that as to the Hawley & Edwards claim, no part of that had ever been paid since the partnership had been dissolved, the business sold and one of the original partners had gone to California.

To combat the claim of indebtedness, Lincoln gave notice to the plaintiffs of the times when and places where he would take testimony to refute the statements made in the plaintiffs' petition. The final disposition of the case was the withdrawal of the petition by those responsible for it.

This brief summary of the three lawsuits which were brought against Lincoln serves as an illuminating glance into the sort of obstacles which were placed in Lincoln's path, the surmounting of which doubtless contributed its no small share toward the making of the man.

Through the Heart of the Everglades—PART II

Path Hewn Through Cypress Wilderness by Adventurous Motorcade; Deer Shot by Guide and Supplies From Plane Come as Food Fails Party

By A. H. ANDREWS

The Dearborn Independent last week published the first part of this article having to do with the experiences met in a motor trek across the unexplored Everglades of Florida. This is the second and final installment.

A PECULIAR thing noted about the far interior section was the almost total absence of small game, though panther, deer, bear and wild cat signs were seen in abundance. Bird life was almost unobserved, the one prominent specimen being the owl whose hoo, hoo, answered by his mates in the distant tree tops, awoke the echoes through the night. There was likewise a dearth of other living things—no alligators and but two snakes being seen by the writer on the entire trip to Miami, sensational newspapers to the contrary notwithstanding. Scarcely any mosquitoes were experienced after leaving the coast, the men sleeping for the most part without mosquito bars.

There is something fascinating about sleeping in the out-of-doors near the flickering campfire, the starlit canopy overhead—far more brilliant here in the tropics than in northern regions—and being lulled to rest by the sound of the breeze in the swaying tree tops. True, the ground felt rather hard at times, and there are vague memories of restless turning at intervals during the night to find some better position for aching limbs, but there were times when palmetto leaves were available which when strewn on the ground in abundance formed a very comfortable bed. The healthfulness of this outdoor life and the country traversed is attested by the fact that no one caught cold from exposure and there was no serious illness on the trip.

Hammock "Island" in marl prairie, these islands being a frequent sight in country bordering the lower Everglades.

Renewed attack was made upon the cypress trees. It was hard, gruelling work to most of us who were not toughened to such exercise and the strenuosity of the trip and slender rations were beginning to tell. The temperature, which in the open had been very moderate, tempered as it was by refreshing breezes, became almost unbearable in the dense cypress, with the sun beating down and scarcely a breath of air stirring. Work created a thirst which was relieved not at all by copious draughts of the warm and flat-tasting water obtained from surface wells dug in the black cypress muck. As the seepage into these holes was often slow and the demand for water urgent it frequently happened that one drank a generous proportion of mud and sediment, but with no seeming ill effects.

To the writer the lack of good drinking water proved the greatest privation, and there were frequent periods when one's thoughts dwelt in anticipation upon the ice cream and cooling drinks one would get in Miami when the Trail's end was reached—but when?

We cut our way through Chatham Bend Cypress after chopping a passable trail through 2,600 yards of virgin forest, and again we found ourselves in a big marl prairie with another cypress barrier a short distance ahead that looked more dark and forbidding than before. The caravan skirted the timber line for a mile or two to the southwest, looking for a favorable point of attack, soon coming to a small, rocky palm hammock where Abe sometimes had camped when on hunting trips.

It was near this point that we began cutting our way into the fourth cypress we had encountered, known as Alligator Bay Strand, and called by others Roberts Lake Cypress, the speedometer at this point showing 100.7 miles from Fort Myers. Camp was somewhat strung out that night, some of the cars being well into the cypress and others still at the edge of the prairie. To the writer this night set in under the most dispiriting conditions of the entire trip. Food was practically gone and the strenuous physical exertion, coupled with anxiety as to our whereabouts, had slackened somewhat our none too rapid progress. Several enforced detours to the southwest had brought us well back toward the gulf coast, as an occasional motor boat was distinctly heard on one of the bays in the distance, but aside from this practically nothing was known till now of our location.

Suddenly a shout caused those in the rear to rush forward. Abe had come in with a deer and we knew we were to eat once more. To add to our encouragement three scouts had returned from a trip and they reported a survey stake, together with some newly blazed trees, indicating that we were now on the premises of the Chevelier Corporation in Monroe County.

Abe related that after killing the deer he had sat down on a log to await the return of the scouting party. He told his fellow scouts that he was glad when they returned as he was beginning to see ghosts and was "scared ojus." The Seminole Indian is a firm believer in ghosts and fairies, the latter being termed by him "the little people."

A supper of boiled venison was hastily prepared which, though tough and none too well cooked, was greatly appreciated by the almost famished crowd. The balance of the night was drizzly—the first rain encountered—and some rushed to shelter and sat in the cars until daylight.

It was on Wednesday morning—and just one week from the start at Fort Myers—that we thought it expedient to dispatch a small scouting party ahead with Abe toward Miami to forward supplies and telegraph to anxious relatives and friends.

After an appetizing breakfast of fried venison the party went to work with renewed energy, but the cypress ahead seemed interminable. Toward noon the hum of a motor was heard and a plane was seen scouting over the tree tops at a considerable altitude. In the excitement of the moment one chap waved his hat frantically and shouted: "Let's all holler together. I can't make him hear all by myself." We built a big smudge in the hope that he would return and discover us, but he failed to come back.

The blazing of the trail through the cypress strands was sufficiently interesting to merit description. In the advance guard were the viewers who pursued a general compass direction, avoiding as much as possible the larger trees, and with hatchet in hand blazing the way on both sides of the route. Then came the axe men and those who bore away the underbrush and fallen timber. When a half mile or so had been cleared a delegation would go back to bring up the cars.

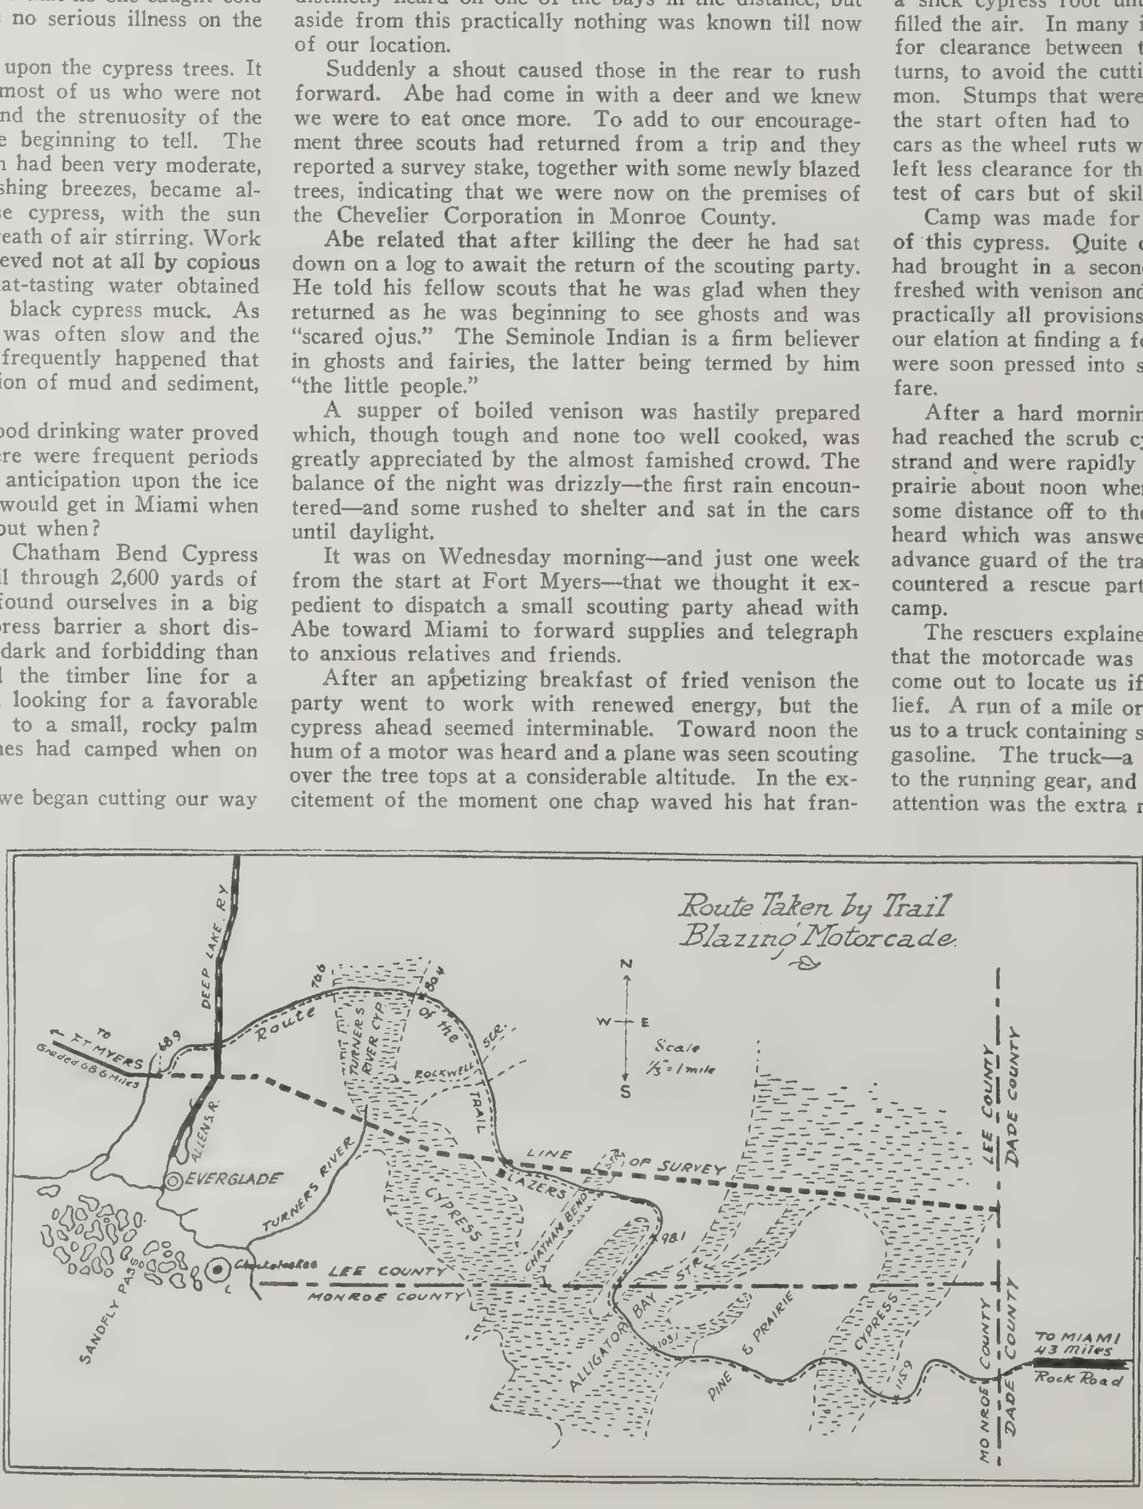
The performance of those little cars was simply remarkable and the wonder is that the entire seven eventually got through to Miami, mostly on their own power, and with little more serious injury than battered fenders and running boards. Amid shouts of "Step on her," and "Give her h—!" the first car of the line would start up, shortly followed by others, leaping wildly like frightened jack rabbits, bumping over roots here and skidding sideways there, until it seemed like they were headed to certain destruction. Once a driver lost his nerve and slowed up, he was almost sure to lodge with one of his drive wheels spinning against a slick cypress root until the smell of burning rubber filled the air. In many instances there was barely room for clearance between two cypress trees, and hairpin turns, to avoid the cutting of large timber, were common. Stumps that were cut apparently low enough at the start often had to be cut lower for the last few cars as the wheel ruts wore down in the soft muck and left less clearance for the car axles. It was not only a test of cars but of skillful driving as well.

Camp was made for the second night in the midst of this cypress. Quite cheering was the fact that Abe had brought in a second deer, and we were soon refreshed with venison and coffee without milk or sugar; practically all provisions had been exhausted. I recall our elation at finding a few slices of mould bread which were soon pressed into service to round out the bill of fare.

After a hard morning's chopping on Thursday we had reached the scrub cypress marking the edge of the strand and were rapidly making our way into the open prairie about noon when a big fire was observed at some distance off to the left. Then a rifle shot was heard which was answered by lusty shouts from the advance guard of the trail blazers and presently we encountered a rescue party of three from a surveying camp.

The rescuers explained that word had reached them that the motorcade was lost in the wilds and they had come out to locate us if possible and bring needed relief. A run of a mile or two across the prairie brought us to a truck containing several big cans of much-needed gasoline. The truck—a light one—was stripped almost to the running gear, and what particularly attracted our attention was the extra rim and tire bolted fast to each wheel. We learned the purpose shortly afterward.

After the tanks were replenished the rescuers went ahead with the parting instruction to follow their trail to camp about twelve miles distant, which we should be able to reach by dark. The ride across this prairie proved about the roughest motoring we had so far experienced, with frequent big outcropping ledges of jagged lime rock, and it was with somewhat of a feeling of relief that we entered a rough-hewn trail through a cypress swamp, believing the camp to be near at hand. But we were doomed to disappointment as we motored on and on, the trail becoming heavier. Suddenly we came to the little truck that had gone

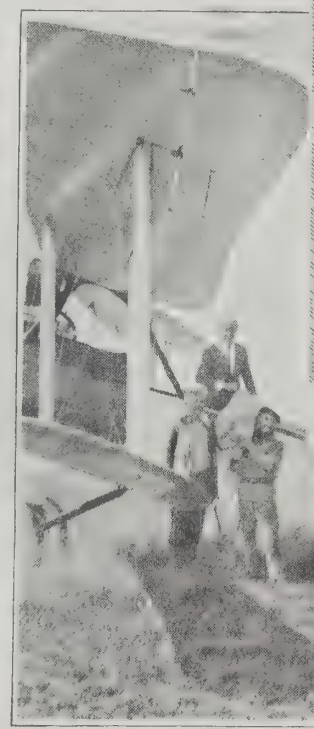


to our rescue. It had been abandoned and its passengers had evidently walked on into camp.

The last few hundred yards of that cypress swamp was an almost bottomless mire, and it was only by strenuous prying with cypress poles, the strewing of branches in the ruts and by hard pushing that the two foremost cars were extricated from the mud and driven out on firm prairie shortly after dark. Guided by the light of the camp fire, the small advance guard reached camp and were warmly welcomed by the four occupants. It seemed that we had arrived at an inopportune occasion, as they were practically out of provisions, being about to remove camp, but gladly shared with us such food as they had at hand. We learned from them that we were five miles from the McCreary Construction Camp, marking the end of the road grade, as far as it had then been completed west from Miami.

With the dawn of Friday we were better able to note our surroundings and observed that the camp was situated in a little, rocky pine and cabbage palm hammock in firm, marl prairie. And best of all, here was an abundance of cool, clear water from a rocky well—the best we had had on the entire trip. Between this camp and the end of the grade lay a heavy marl prairie, somewhat swampy in places, where we were likely to experience difficulty in crossing.

Five cars and most of our party had spent the night in scattered positions throughout the cypress, much to their discomfort, and work was early resumed in extricating them from the mire. Shortly before 10 o'clock the whir of a motor was heard and a big plane was observed scouting overhead. A blanket was spread on the ground to mark a safe landing place, but our efforts to attract the attention of the aviators seemed futile, as they soared away on to the westward. They soon returned, however, and after circling about a time or two made a safe landing. The aviators proved to be Captain W. A. Carr and N. C. Torstensen in a big German Rumpler five-passenger bombing plane. And, Oh joy! They had brought five big sacks of bread and canned goods from the Miami Chamber of Commerce, which had heard of our plight.



Airplane landing food supplies for Trail Blazers.

After conversing a bit, and promising to return the following day with cans of much-needed gas, Captain Carr departed for Miami. While in camp Captain Carr observed that he had circled all over the cypress, plainly seeing our tracks, and did not see how we could well have improved upon the route that we came.

It was decided to remain in camp until the following day. New arrivals were nearly famished and the culinary department was kept busy for some time to supply their needs.

Much of the evening was spent in rehearsing a song that had been evolved, it running thus to the tune of "Tipperary":

'Tis a long, long way to
Miami;
It's a long way to go.
It's a long way to Miami
O'er a road we did
not know.
Good-bye, Fort Myers,
Estero and Naples too.
'Tis a long, long way to Miami,
But we went right through!

We found shortly that we were a long way from going "right through," but of this we were blissfully in ignorance. Mr. Cook had told us that we had a hard day's journey ahead of us to make the five miles over the marl prairie to the McCreary Camp on the end of the grade, and that we might make it by night with good luck, possibly. But we were inclined to think that he was overestimating the difficulties, for our spirits were rising, and were we not almost to the grade?

Saturday morning an early start was made, but we found that the farther we went the softer the mud became. No one knowing any definite route, each car plunged in haphazard wherever seemed the best going, and soon all were helplessly floundering in the mud. It was sometimes necessary to lift a car bodily from its tracks and set it over on new ground for a fresh start, which, of course, would have been impossible with cars of greater weight.

It was approaching the noon hour. One car and the commissary truck had been dragged to somewhat firmer footing. We were apparently in a sort of pocket, for ahead in every direction was boggy soil.

Anything seemed preferable to idle waiting, so six, including the writer, set out on the three and one-half-mile hike for the construction camp across the prairie, which, because of its marshy condition, made the distance seem twice as long. In the distance in various directions dense clumps of cypress could be seen, while meandering here and there through the open country were thin leads of small, scrubby trees. We soon found that the firmest footing was along these scrub cypress ridges, and avoided the wide, open spaces as much as possible.

We had not progressed far when the big plane was seen returning from Miami. We later learned that it failed to bring a much-needed gas supply, as agreed upon the day before, but the pilot was prevailed upon to draw ten gallons from his tank, which helped very materially, for the cars were now situated where every additional gallon of fuel, as well as food supplies, must be packed by hand from the end of the grade three and one-half miles across the marsh, thirty pounds being all the average man could well handle at a load.

The sun beat down upon us unmercifully and it was with great relief that we eventually reached the shade of a dense, rocky hammock, through a clearing in which we could see the dredge a half-mile ahead. This hammock was of most peculiar formation, being almost continuous rock of flinty hardness and full of pot holes through which the trees and underbrush had grown, and necessitated picking one's way carefully to avoid stumbling and possible serious injury.

Advance guard of the motorcade.

A Negro blasting crew eyed us curiously and in response to our inquiry for drinking water pointed to several barrels standing near the dredge in the sun. Now that we had reached the verge of civilization we counted upon getting good drinking water, but we were doomed to disappointment, for that water was simply awful, being lukewarm and tasting strongly of lubricating oil. It seems that the ditch alongside the road grade was the only source of supply, and the water being discolored by dynamite and full of dead fish, it was, of course, necessary to condense it through the boiler, with results anything but palatable, and thereafter we dispensed with the water, drinking coffee until reaching Miami.

We arrived at the construction camp shortly after the regular dinner hour, where we were hospitably received by the camp boss, notwithstanding that they were themselves nearly out of provisions. The Negro cook soon had us a palatable dinner ready, and those hot biscuits seemed the finest thing we had had since leaving the United States more than a week previously.

The camp was situated in a scrub cypress thicket on pot-hole rock formation, being about forty-three miles west of Miami and a mile and a half from the Monroe County line. Two small bunk tents constituted the only living quarters for the white men of the crew, so sleeping accommodations were necessarily at a premium.

Several other Trail Blazers straggled in during the day and part of the afternoon was spent in perusing copies of the daily papers which told of the entire motorcade being lost in the Big Cypress and positively declared that we would never make it through to Miami.

The camp truck came in that night from Miami with supplies and the writer pre-empted the seat for a bed—very comfortable indeed to much that we had been experiencing. Others of the party disposed themselves as comfortably as they could on the rocks around a camp fire. Rain had been threatening for the past several days, and about midnight came a heavy shower which drove us all to the cook tent for shelter. The tent was raised about three feet from the ground and the wind came through in gusts chilling us to the bone. Our individual recollection is of sitting, back to back, on a soap box, shivering until sunrise. However, such are insignicant hardships when one is trail blazing and making history.

On Sunday morning two cars came out from Miami, and to relieve the crowded condition in camp, a number of our party went back with them. Provisions came that afternoon, and I determined to accompany them as far back as the cars to get camera and suitcase that had been left behind.

About dark we were visited with another deluge which lasted some hours, driving all to the shelter of the cars where we spent a somewhat restless night. The outlook Monday morning was discouraging, indeed, with water standing everywhere. Here we were once more within sight of the U. S. A., with the rainy season, which we had sought to avoid, having apparently set in on us and threatening to thwart the final success of the expedition.

The writer returned to the grade. Several of the Trail Blazers returned from Miami with a truck, bringing planks and a big coil of rope.

At this time the writer and another were offered a car and the long drive to Miami was begun. Not a house was encountered for the first twenty miles, nor any sign of human life except a few scattering Indian camps, and for much of this distance the road was indescribably rough, owing to the fact that the rock spoil bank comprising the grade had never yet been leveled down for traffic except sufficiently to permit of the weekly trip of the truck going in for supplies and mail for the construction camp. The brown marl and outcropping rock on either side soon gave way to the rich, black-looking muck of the Everglades, covered with dense growth of sawgrass and dotted here and there with little wooded islands.

After passing the first settler's house and farm the remaining twenty-five miles into Miami is for the most part excellent road. Real estate signs began to greet the eye and soon developed properties followed each other in rapid succession. About twelve miles from the city we were held up by a dredge which had cut a big canal across the trail. As detouring through the wet muck appeared out of the question we abandoned the car and were ferried to the opposite side where we fortunately met some winter tourists. Unshaven, in dirty shirts and overalls, and notwithstanding our general forbidding appearance, they were delighted, upon learning our identity, to take us in to the hotel, where we arrived about seven p. m. Much as we had dreamed of soda water and ice cream when out in the sticks, a bath and a shave seemed the greatest luxury of all, to say nothing of the real comfort of being appareled once more in clean clothing.

Of the next few days in wonderful Miami, the sightseeing, the warm reception and hospitality extended us everywhere by her people, much might be written which, though interesting, is not strictly in line with trail blazing and would unduly prolong this narrative. Upon our arrival in the city we found that several of our party had already left for their homes, and six more took their departure that night on the train, being unable to wait until the final arrival of the cars. It had been our original intention to all come in together, looking wild and woolly, and singing our trail songs.

Two more days passed without any encouraging word from the marooned cars and finally on Friday morning a conference was called between several of the Trail Blazers. It was contended that by bolting extra rims and tires to the car wheels they could be brought out under their own power. It was decided to try out this plan, and a crew of fresh men was secured with the necessary equipment and sent out immediately to the scene. The plan worked successfully. Extra rims and tires were then bolted to the wheels and the cars came in to the grade under their own power, arriving in Miami Saturday night—just one week from the day when they first plunged into this worst and last bog of the entire trip.

Sunday afternoon the seven cars formed a procession down Flagler street to the waterfront park, where a reception was held, the remaining Trail Blazers being greeted by the president of the Miami Chamber of Commerce. After the reception most of the party departed immediately for their West Coast homes, but not by the route they had come. It was a wonderful experience to have come through for the first time on this history-making motorcade, but all were unanimous in the declaration, "Never again."

The results of this motorcade have been far-reaching and all that could have been desired. Through the films and the public press it has brought the Tamiami Trail to the attention of millions of persons who had never previously heard of this great highway project. It has proved the healthfulness and fertile character of the country through which the Trail will pass; all that is needed in addition to a road being drainage to develop this wonderful section. It has also shown the most feasible route to be through northern Monroe County where less cypress is to be encountered.

Best of all has been the stimulus to the building of the Trail all along the line. Since the motorcade, state aid amounting to many thousand dollars has been awarded several needy counties to assist in building their respective links in the Trail.

Selective Immigration Controlled at the Source

Ample Precedent for Secretary Davis' Plan to Stop Undesirables on Other Side

By DIRK P. DE YOUNG

IN THE proposed plan of James J. Davis, American Secretary of Labor, to select and control prospective immigrants to the United States in the countries of origin, not here, there is ample precedent both in kind and in comparative likeness to uphold his ideas. There are abundant examples in our own immigration and consular service to say nothing of the work of other governments to guide us. Moreover, this innovation, if it can really be called that, probably originated in the minds of certain consular officers of the United States, men of years of experience in handling immigrants at the source, while the State Department, the head office of our consular corps, is known to be behind the Davis proposal.

Many of us are prone to forget that the United States has a few hundred consulates scattered over the face of the globe in conveniently located spots. The officers in charge of these outposts of our government are not, as is sometimes popularly believed, asleep all the time even though they are far away from the watchful eye of the American public. Now and then, at any rate, they send home a good idea, the results of their personal experiences or observations, and it is believed that this one had its origin at the source, among a number of the older officers of the corps, who have for many years handled emigrants of many lands destined for the hopeful shores of Uncle Sam.

These consular officers of our government stationed abroad have good ears. That is one fundamental requirement for entrance to our foreign service. And they keep these good ears to the ground. They have been hearing things, and having good eyesight, too, they have been seeing things, which have been reported in numerous confidential dispatches to the Secretary of State at Washington. Their reports, comprising reams of neatly typed data with respect to this whole immigration problem, as it looks to them, as the watchdogs of American interests abroad, have no doubt been forwarded through the interlocking system of interdepartmental co-operation in the National Capitol to the Secretary of Labor, who has studied them, and who himself recently made a trip to Europe to consult with our consular officials there and others to perfect his proposed plan. Those of us who have had experience in our foreign service know that the source of our immigration troubles is in Europe, not here, and that the remedial steps should begin there also instead of in this country. It is therefore quite evident that Secretary Davis has conferred with the men abroad.

Some of the things, most likely, which our consuls have been hearing and seeing, relayed to the Secretary of Labor, probably have to do with the matter of selecting and controlling the foreign element which makes up our immigrant class, before that element actually gets here. It is a fact which but few Americans realize, but which our representatives abroad have long known, that certain European governments, secretly boasting of the fact, have in recent years sought to unload their undesirables upon the broad shoulders of Uncle Sam. Until the beginning of the present century we were getting the sturdy element, agriculturalists or other good producers largely, but of late only a small percentage of such are coming, while peddlers, small shopkeepers, salesmen, beggars, incompetents, and political malcontents now comprise the bulk of our receipts. Too many of those now coming have their heads filled with strange social and political ideas, while disease, not apparent to inspectors of the government here, lurks in the rest of their bodies. Our consuls have heard and seen all of that.

Present Method of Selection Unfair

THE machinery at Ellis Island, and the requirements of the quota law, a part of the present emergency measure, which expires June 30, this year, are not of sufficient scope to meet this situation. Moreover, it would be impossible from the very nature of things to provide rigid selection and control of immigration on this side of the water, for the quota law alone, as it now stands, without the selective process on a broad basis, is a great embarrassment to the government. We are already sending back too many, as a result of the quantitative test alone, determining the quantities as we do now, upon arrival here, to say nothing of the greatly increased number we would be obliged to ship back if proper attention were to be paid also to the fitness of all applicants for admittance to the country. The consuls in Europe have no doubt heard the growls of the returned emigrants there, too, who have spent the savings of a lifetime coming hither, only to be sent back home again because the monthly or yearly quota allowed to such nationals as immigrants here was previously exhausted. Having heard that, and much more, and having seen the chaos resulting from our poorly devised immigration system, they have laid the facts before the State Department and the Immigration authorities at Washington with imposing eloquence. Indeed, having had a number of years of experience in that branch of the government service myself, I am sure that this idea of Secretary Davis to select and control future immigration at the source, namely, the countries of origin, is the result of much first-hand knowledge gathered by our able consular corps.

Furthermore, to put that excellent idea into practice, that same consular service, a branch of our government which is as old as the nation itself, will have to be utilized. There is no other agency recognized in international law or practice which can perform the duties inherent in such control. Immigration officials sent abroad to undertake such work would not be able to function unless they were attached to our consular offices. But that is the legal finesse of the question, whereas we are more concerned with its practicability, that is, the workableness of regulating the flow of immigrants to the United States at the head of the stream. Good Americans, those who uphold certain standards of ours, those who want to perpetuate our institutions as our own, I am assuming, agree with any reasonable proposal to limit our immigration to a well-selected class, limiting them with great fairness, and with no unnecessary hardship in the process, under a plan which should satisfy our needs for new blood, socially, politically, and industrially.

The Davis proposal, as before stated, has the merits of successful precedent. Our Canadian cousins, for a long time, have been selecting their immigrants at the source. They have made no concealment of the fact that they consider Canada for the Canadians. Their agents go all over Europe soliciting the most desirable people, who, so chosen abroad, without any exception almost, are admitted when they arrive at the ports of the Dominion. By the same token, those government representatives, stationed in nearly every large Continental city, flatly reject "the halt, the lame and the blind"—those lame in their heads as well as those lame in their feet. These agents separate the wheat from the chaff, right in the homeland of the emigrant class where it is possible for them to gather first-hand evidence regarding the antecedents, capabilities, moral and mental fiber of the individual, as well as other necessary data to determine such a person's fitness to become a future citizen of Canada. Such a thorough process of selection, it must be conceded, is not possible on this side of the water, three thousand miles away from all the evidence.

Propose Clearing Stations in Europe

WHILE consular officers in my day had no more authority in immigration matters than such officials now have, we were nevertheless constantly advising with prospective immigrants to the United States. When I was stationed at Amsterdam, less than ten years ago, before the post-war flood of immigration to this country began, there was scarcely a day passed in which one or more Dutchmen did not seek my advice regarding prospective departure for American shores. The restrictions were approximately the same as now, nominal largely, but the quota law, that prodigy of the war's aftermath, had not then been conceived. We could therefore advise our callers with comparative exactness what their chances were of admittance by the immigration officials at Ellis Island. Extend our authority a little further, giving consular officials the power to investigate, from the local mass of evidence available, and to recommend or reject such applications, reserving to those rejected the right to appeal to Washington, and you have right there all the machinery that is necessary to select and control immigration at the source. In addition to that, the weeding-out process, through the consuls or their attachés abroad, would relieve the strain on the physical resources of the system at American ports. This simple idea of handling the situation might cause a number of immigration officials here to lose their jobs, one reason, perhaps, why selection and control at foreign ports is not popular in some quarters, but that could be adjusted to preserve peace in the official family by appointing such men immigration vice-consuls at foreign ports. The quota provisions of the law should be retained, for the sake of fairness to different foreign nations, but the state of such quotas from month to month should be determined at some clearing house stationed in Europe, where consular officials co-operating would select the immigrants and regulate the quotas, thus simplifying the present impossible procedure of attempting to do that here. That, no doubt, is what the Secretary of Labor, after studying consular reports, and after a personal investigation in Europe, proposes to do.

We have a precedent for the appointment of special immigration vice-consuls in our relations with China, where the enforcement of the Chinese Exclusion Act involved us in considerable difficulty. About twenty years ago—1904 and 1905 to be exact—China was passing through some serious convulsions, that particular one in the nature of an American boycott, when "Young China" organized a movement against the importation of American goods. That movement was aimed at the Chinese Exclusion Act, which it was alleged was being unjustly enforced. The movement became very effective, spreading from the north of that country to the south of it, and American traders in the then empire, selling tobacco, piece goods, petroleum, and other staples, lost as a result millions of dollars' worth of business. Besides there was loss of property and danger of loss of life on account of the intense feeling over the administration of that act. The movement was finally quieted, but it smoldered for a long time.

In 1910, it broke out afresh, with a more serious and sustained rebellion against the enforcement of the exclusion measure. Complaints became louder, diplomatic protests to Washington by the Chinese became sharper, while the cases of unjust treatment were cited in large numbers, thus increasing the ill feeling between the two countries. It was not the act itself so much which created the friction as the provisions of the measure which made it necessary for Chinese men to come to American ports to test their eligibility under that act to enter the United States. I was at that time in the consular service and a friend of mine was stationed at Hongkong, where the pressure on that law was applied the hardest. The consul-general at that post then found himself involved in a maze of Mongolian immigration problems as intricate as the European one of today.

Under the Chinese Exclusion Act no Chinese are allowed to enter the United States except certain classes, including merchants, students, teachers, and travelers. The procedure then was, and still is, for admissible Chinese to get what is known as "a Section Six Certificate," so named because it is prescribed in section six of that act. That must be obtained from the Chinese government, and has to be visaed by the American consular officer at the port whence the holder thereof embarks for the United States. Inasmuch as the Chinese officials would issue such a certificate to anyone who asked for it and paid the fee, the system in actual practice soon became one in which the consuls made an investigation of such applicants before honoring those certificates with a visa. Later on, the order was reversed, so that consuls first made the investigation, indicating to the Chinese government which would pass; then a certificate was obtained and the visa followed.

But even that did not work out satisfactorily, for after all that official rigmarole the Chinese so passed were again subjected to a second examination by American immigration officials on this side of the Pacific. And it was these final rejections which were really causing the trouble. In one year there were examined at Hongkong something like three thousand applicants, out of which about ten per cent were passed by consular officials at that post, while out of that slender residue, carefully selected by our officers at Hongkong, the American immigration officials in this country sent back about one-third.

At that time speculation in Chinese coolies was rife. Hongkong, the great entrepot of the further side of the Pacific, was an important center for that traffic. A Chinese coolie, safely landed in the United States, disguised as a student, or as a teacher, was worth about $1,300. The actual expense of bringing him over, with other necessary trimmings included, was approximately $300, leaving a net profit of about $1,000 on every coolie brought in. It was the fraudulent palming off of coolies as merchants or students in connection with bona fide cases which made the work of the consular officials so difficult. The ends to which the coolie brokers and the applicants themselves went to accomplish their deception form an interesting chapter, unpublished as yet, in the international history of the United States. No doubt many of the applicants passed under the system were frauds, but on the other hand a large number of those rejected were genuine and it was those genuine cases which furnished the explosive for the anti-American agitation. This same feeling is already appearing in Europe, not because we want to regulate or even prohibit immigration, but because of the unfairness of determining the fitness of prospective immigrants after we have first let them come all the way over here, when a better policy, that of determining such matters on the other side, is so simple to put into effect.

In the case of the Chinese tangle, the situation was met by appointing special vice-consuls from the immigration service of the United States to serve in our consulates in Chinese ports, so that cases passed in the country of origin, in this instance, China, would be admitted without further examination on arrival here.

Consuls Control Chinese Immigration

THUS in our consulates in China in actual practice today, in emigration from that country and immigration to this one, under the Chinese Exclusion Act, we have a splendid illustration of what can be done with our European immigration problem, too. In the different ports there, whence Chinese embark to the United States, selection and control have been carefully worked out by our consular officers, either of career or immigration experts assigned to those places. They have developed a system of detecting frauds, of examination, of keeping records, with great detail, so that the law is better enforced from that end now than it ever was over here. That method also had the merit of placating the Chinese, who rebelled at the system of coming all the way over here to test their chances of being admitted to our country, for they saw then that they were being fairly treated. It also lifted the pressure on the law, for it was no longer thought possible to evade it, with American officials on their home ground to find the evidence against them. During the past ten or twelve years the Chinese Exclusion Act has been administered so smoothly that we never hear about it.

No doubt there should be a system of appeal from such consular decisions to the immigration bureau, and finally to American courts, as now, but with the primary decisions made in the country of origin, not many would carry matters on up, if they lose. Moreover, the very fact that such cases are decided in the emigrant's homeland reduces the possibility of eventual success of fraudulent cases, since our experience with China shows that undesirables no longer apply. As our consular corps is constituted today, nearly every officer in the service has sufficient training to perform the duties of immigration work, while he is far in advance of the immigration staff at American ports in his knowledge of the people of Europe who are embarking daily for the United States in unprecedented numbers.

What the country needs is to establish a system by which the government can determine what immigrants it wants and then establish machinery by which other aliens may be excluded before they leave their present homes. That is what the Secretary of Labor now recommends. Canada has found a way to do it, without hardship to anyone. The United States itself has been able to accomplish such an end in dealing with China. Certainly, with hundreds of American consular officers in Europe, trained to do that very work, our immigration problem, now in a hopeless tangle, should find a simple solution.

Work on Scotch Farm Goes on Year Around

Labor Conditions Improved and Lot of Hand Is Peaceful and Quiet

By VICTOR MITCHELL

THE world's history has proved that the Scottish peasant is something more than a rural laborer, hind, or plowman; that he is not merely a hewer of wood and drawer of water, but possesses potentialities of a far-reaching nature. In the sublime picture of Scottish rural life presented by Burns in "The Cotter's Saturday Night" the poet says that "From scenes like these old Scotia's grandeur springs," and it is an undoubted fact that some of the greatest men the country has produced were born beneath a thatched roof—in an "auld clay biggin' with a butt and a ben." But the cotter of today is no longer the single-minded man of simple tastes that he was a hundred years ago; modern conditions have given him a new outlook.

The cottage of rubble stones cemented with clay and roofed with straw is rapidly disappearing, even in the most remote districts, and in its place there stands a trimly built but less picturesque dwelling of solid masonry with slated roof and plastered walls. The march of modern hygiene has also wrought wonderful changes.

The Scottish farm servant of the present day, be he married or single, is quite comfortably housed. If he is a married man he generally has a kailyard and a bit of garden ground attached to his "cotter hoose," and he is frequently allowed certain perquisites in the shape of oatmeal, milk, and potatoes in addition to his regular wages. The single men usually live in some part of the farm buildings, and have their meals in the farm kitchen. The "bothy" system, by which the farm hands were herded together in one large apartment for eating and sleeping, has been abolished. The farmer cultivates every foot of his land and keeps it clean and in good condition. Slovenly farming the law will not permit. He hires his help twice a year at what is called the "feeing market." This is a sort of open-air labor forum which is held in the spring—at the Whitsunday term, and in the autumn—at Martinmas. It is a general holiday for farmers and farm servants alike, and is usually held in the nearest market town, affording an opportunity for employer and employe to get together on an equal footing and make engagements for the ensuing half year.

Not so many years ago it was the custom for the farm maids to be engaged in the market place in the same manner as the men, but this had its disadvantages and has been superseded by a system of registry offices or female employment bureaus.

The ordinary weekly market day in Scotland is held on a Friday, but the half-yearly "Feein' Friday" is an event of outstanding importance. When business has been completed, and the farm hand has "feed" with a new employer or decided to "bide" with his old one, the rest of the day is given up to rustic revelry of a more or less harmless nature. Jock treats Jean to peppermint drops or a picture show with all the abandon of a city cavalier; he may take her for a whirl on the merry-go-round or some other form of amusement of which the Ayrshire plowman with all his gifts of imagination never dreamed.

Owing to the nature of the climate, the work of the farm proceeds almost uninterruptedly all the year round, except in some of the more remote districts of the Highlands. Plowing and cultivation go on winter and summer, so that the round of duties is of a more settled character than that associated with a climate where there are extremes of heat and cold. Regular hours in the work of the farm are the rule, and the farm servant has his period of leisure just as surely as though he were employed in a city factory or business office. The businesslike manner in which a British farmer conducts his farm is one of the bulwarks of agriculture.

One of the things that the farmer has in Scotland is good roads, and this is an important factor in keeping his employes contented and happy. When the day's toil is over the farm hand may make his way to the nearest town and enjoy some of the sources of wholesome amusement provided there; or perchance he may "woo a bonnie lassie when the kye comes hame." During the long summer nights it never gets really dark in the north of Scotland, and there is ample opportunity for a quiet hour in "oor kailyard," or a twilight ramble among the heather.

In the wintertime, when the nights are dark and long, in striking contrast to those of the summer, the visits to neighboring towns and the ramblings in the dusk give place to concerts and other entertainments in the local meeting hall, where merry, friendly country folk convene to pass the time "wi' sangs and friendly cracks." The minister or the village dominie may give a reading, and the local Harry Lauder keeps everybody in good humor with his quips and cracks. The inevitable dance follows to the music of the bagpipes or the fiddle, and the hoochs of the lads and the skirls of the lasses awaken the echoes of moorland and hill.

Although in Scotland the younger generation seems to be departing from the piety and simplicity of the days when "the sire turned o'er, with patriarchal grace, the big ha'-bible, ance his father's pride," the rural worker of today is made of as good material as his predecessors. Public libraries have widened his field of information, and the facility with which newspapers and periodicals of all kinds can be procured gives him every chance of finding out how the world wags.

Perhaps there is no more peaceful spot on earth than a Scottish upland village. An atmosphere of security and independence prevails that is not elsewhere found, and the wee hoose among the heather is a model of cleanliness and order. Its venerable roof is impervious to the weather, and age has enriched it with mellow colorings which artists love to copy. The faces of the village bairns glow with health and vigor, and there is a spring in the step of the sturdy young men and bonnie lasses as they set about their various avocations. When the children are at school, and their elders at work within doors or in the fields, the long winding street which forms the only highway is deserted save for a few wandering fowls, or a dog or a cat dozing on a doorstep. Sometimes a group of guidwives may be seen at the village well indulging in a brief gossip, just as wives have done since the world began, or some ancient cronies may be seen in front of the "smiddy" settling to their own satisfaction the affairs of the nation. By and by they are interrupted by the arrival of Postie with the morning mail, and a new turn is given to their slumbering debate, and a fresh current to their thoughts, through contact with a messenger from the outer world; that world into which, like an overflowing mountain stream, the sons and daughters of the village have gone to seek other channels of progress. It is well that supplies of energy and power come from such a pure fountainhead, for it is nothing short of a calamity when the source of such streams becomes exhausted.

Frenchman Is Losing Faith in His Government

Concluded from page 2

market. Then came along Citroen who had been making war munitions and who turned his plant over to putting out tax-dodging designs of automobiles. They are mostly odd little things about the size of a bath tub. But they run on a few drops of gas and the people have bought them by the thousands. Citroen has proved the existence of a new market for automobiles, but the experts say that he is an exception. They say that the French peasant will never change his ways and will use just so many articles and consume just so much food a year—in spite of the fact that an American farmer who lived like a French peasant would probably be investigated by his county authorities!

Do Little to Better Methods

THIS idea—this Stone-Age idea—of the fixed consumptive capacity of the home market dominates French manufacturers as well as French theorists. The notion is that the needs of France can be tabulated and that the colonies in Africa must be developed to produce what France cannot, so that the nation may be self-contained. And for the products of France in excess of the rigid home requirements, foreign markets must be found—not only that, these markets must be sewn up against competition just as France itself is defended by tariff and other regulations against foreign competition.

There is a faint impression that methods of manufacturing might be bettered, but it is very faint. The prevailing thought is that the way to produce cheaply is to pay low wages and work the men through long hours. High wages, intensive production, and therefore low costs do not enter into the picture. Many Frenchmen know about modern manufacturing but they are not the men who control industry.

The large industrial power in France today is the Comité des Forges. This is an association of about three thousand companies working in metal—from blast furnaces to table knives. The members employ approximately two and a half million persons, or nearly one-sixth of the industrial population. This association was dominated by Eugene Schneider, the head of the famous Creusot works, and by Francois de Wendel, who heads the second largest iron works. Next in the group come the coal operators (Comité des Houilleres), the association of chemical industries, and the Banque de l'Union Parisienne. The chief metal business is making munitions. The big metal plants could not continue without munitions. France is making them not only for her own armies but for Poland, Rumania, Jugo-Slavia, and Czecho-Slovakia, and has loaned them the money to pay for what they buy.

The industrial groups—other than the metals—were very much worried when Alsace-Lorraine was returned, for they feared that the mills and factories of the territory would take business away from the mills and factories of other parts of France. They would like to have seen a customs barrier. But they found that the destruction of the factories in the north by the Germans had so lowered the production of France that their fears were groundless, although, as a precaution, the group insisted that the treaty contain a provision for the free entry of certain French products into Germany.

It was thought, when Lorraine was taken over, that the Saar mines would provide the French with coal for the iron ore that they regained with Lorraine. As everyone knows, the chief cause of trouble between France and Germany has been the separation of the coal fields and the ore beds. Germany in the Ruhr has good coking coal, while France has the iron ore in Lorraine. That is why Germany grabbed Lorraine in the Franco-Prussian War. The interdependence of the two districts ought to be a bond of union, but European politicians can never look at a boundary line without wondering how it can be used to whipsaw someone.

The repatriating of the Lorraine field did not mean so much to France as was expected; for to use the iron she had to have Ruhr coal. Germany, on the other hand, could carry on very well with Swedish and Spanish ore and her iron industries quickly threatened to take all Europe's business. This was very serious, for the French group had already been expanding all over the Continent in the delusion that German competition was ended. They had bought into and received concessions in Poland—for the most productive part of Poland is that which was taken away from Germany. They had likewise bought into Czecho-Slovakia—which contains the chief industries of the old Austria—and they had also made some investments in Rumania and Hungary. And also if Germany could manufacture she could make war.

The investments were endangered by the activity in the Ruhr. So, it was pretended, was the safety of France. And therefore the army went into the Ruhr. France in the Ruhr has a strangle hold on the business of Europe—literally a strangle hold, for the intention is to do business for the benefit of French manufacturers. And business is not done that way; in good business the buyer must profit as much as the seller. The intentions of France in the Ruhr are perfectly well known to the other nations of Europe, and that is why England has been trying to force a settlement.

People Don't Know Policy

THE real policy is not generally known to the French people; the newspapers print only what they are told to print—excepting a few radical sheets which never print the news anyhow. Perhaps the people might like the policy if it were explained to them but before it could be explained it would have to be changed, for it does not involve any benefit for France as a nation. Just as the peasants used to put their money mostly into the bonds of foreign countries instead of into the securities which would build up their own country, so the plan of the industrial groups is to "capture" trade and supply it from the factory in which the costs are lowest—which are now the factories in countries like Poland where the money is low. In the long run they want to be able to throw their production to where the labor is cheapest—and thus control wages. The notion that high wages paid for high production builds buying power is absent from their calculations.

Now take the French workman. He is a good fellow. But he has been badly led. He has been used as a tool by various kinds of people who call themselves labor leaders and who have only a slight concern about labor. The leaders are intent upon socialism, syndicalism, or communism. They have taught the workers nothing of a useful nature but have filled their heads with "workers' control" and the usual riffraff current in "advanced" circles. They have never taught that a man's pay is controlled in the end by what he does.

During and after the war the labor leaders were catered to by the government and had a chance to make good with the worker by getting his wages jacked up and his hours shortened. Since then the French worker has done a minimum of work for a maximum amount of pay.

Money Ring Grips Nation

THE movement reached its top with the railroad strike of 1920 which was called for political purposes—to nationalize the railways. It fell flat. The people supported the government. Then came a big dock strike. The government found that the troops would act against the strikers. That was the end of the French labor movement—the union membership is but a fraction of what it was in 1919. The whole movement was political and the leaders were merely trying for political power. Now they are fighting among themselves as to what sort of Socialists or Communists the French workers ought to be. In the meantime the remnant of organized labor contents itself with making faces at the public—it calls strikes just for the sake of striking. On last May Day the bus drivers of Paris decided that they would not keep the annual strike day with the other trades, but to show their sympathy they would stop their busses for a few minutes at a given hour during the day.

It was quite funny; the busses all stopped at noon. The drivers, the guards, and the passengers lighted cigarets and chatted pleasantly for five minutes. Then the demonstration was over and they went on!

The French workman was for a time through with labor leaders and willing to co-operate with the employers. But the employers then became as foolish as the labor leaders. They decided it was a good time to cut wages and increase hours. They went about it ruthlessly—in just the same fashion as the wages had been raised and the hours shortened. They have not yet gone far with the program—but quite far enough to make the workers think they are being oppressed. The Communists have taken advantage of the situation to get to work and Paris is filled with all sorts of Bolshevik posters—though not in the tourist sections. A delicate, though not a difficult situation, is being handled with utmost stupidity. The workers do not want to be Bolshevists—they are being forced into it.

So there is the whole complex situation. It would seem that the legitimate rights of the people are being subordinated to a money ring. It explains why the French Government does not want to get into an international conference. But the important fact is that the politicians are playing with fire. The people are restive. They might become desperate. And some of the industrialists have become restive. De Wendel does not get as much munition work as does Schneider and so he has recently put through a compact with German interests for coal. He thinks he can do better as a partner with Germany. There is no telling what may happen.

The exiled Czar Ferdinand of Bulgaria.

IT IS related that a stranger, visiting an European palace, interrupted the patter of the guide with the remark, "Yes, I know all about that. I used to be king around here."

Thus, according to the old popular song, it makes no difference what they were—these ex-kings and potentates—it's what they are today that counts.

And today, it would seem, they are not such a much.

Still there are so many of them and it wouldn't be altogether human for them all to accept their lot complacently and give up hope.

No need to worry much about them, however, for they are shining proofs of the world's advance. In times past a monarch out of a job and out of prison was regarded as very unsafe. Usually when they deposed one they killed him and his immediate heirs, unless, mayhap, it was an heir who inspired the killing.

But in recent years only the Bolsheviki went to that extreme in the brutal butchery of the Romanoffs. In other countries royal superhumans were merely shoved to one side because there was no further use for them. The royal army of the unemployed has lost much of its past glamour—and danger.

The return of the former crown prince of Germany to his native land and the threatened return of his august father, the former kaiser himself, failed to precipitate a frenzy either of apprehension or anticipation. In some quarters the development was regarded as inspired by the enemies of Germany—a sort of Apple of Discord tossed designedly into a troubled country to make its affairs the more chaotic.

But Wilhelm Hohenzollern remains in Holland despite the fact that some of the monarchial agitators have espoused the cause of the house of Wittelsbach, whose present head is Prince Rupprecht of Bavaria, and conspire to place him upon the Imperial German throne. If efforts in behalf of either or both continue to be as puny as those put forth by Hitler and Ludendorf in their rather amusing rathskeller "putsch" in Munich recently, proponents of democracy in Germany would do well to encourage occasional repetitions of similar demonstrations.

The most pathetically shrunken of European dynasties is that of the haughty Hapsburgs. For 800 years its history has been replete with triumphs, romance and tragedy. After the dual monarchy of Austro-Hungary went to pieces and the last emperor, Charles Hapsburg, was banished from Vienna, he made two desperate but puerile efforts to win back the throne of Hungary. Instead of suffering the fate which many of his ancestors had imposed upon plotting rivals, he was deported to the island of Madeira, where he died of a commonplace ailment, leaving a pretty widow with means scarcely sufficient for the proper maintenance of herself and six children, but who added another child to the burden a few months after her royal husband's death.

The eldest of these children, now a likely lad of eleven, finds it impossible to escape—even if he wishes to do so—the regal heritage of nearly a millennium. Royalists in both Austria and Hungary pin their hopes to him and there is said to be a rivalry for the honor and high privilege of providing him with the upbringing befitting him whom they already call King Otto II.

And then there is the "Sly Fox of the Balkans," former Czar Ferdinand of Bulgaria. That crafty diplomat of the old school became a tool of the rival powers in their plan of whittling down the "Sick Man of Europe," the Turkey that maintained a precarious foothold in Europe by playing upon the mutual jealousies of England, France, Russia and Germany. This son of a German duke and a French princess assumed his post as ruler of a principality acknowledging the nominal sovereignty of the Sultan, but in 1907, with the connivance of Austria, declared his independence and assumed the title of czar. In 1915 he entered the war as an ally of the Central Powers and his abdication was a condition of the surrender of Bulgaria in September, 1918. His son, Prince Boris, succeeded him and he has since made his residence in his native Coburg. Long an accomplished and energetic trouble maker, he nevertheless is a shrewd observer intimately acquainted with the complicated affairs of his none-too-beloved Balkans and he knows when he has enough or all he can expect. He's resigned if not contented.

With the democratization of Germany in 1918, Saxony and Wurtemberg, as well as Bavaria, ceased to be kingdoms and lost their kings, Frederich August and Wilhelm II. The latter died in 1921.

One deposed monarcn who was not a war casualty is ex-King Manuel, of Portugal, still a young man of thirty-four, living in more than mere comfort in England, and a prominent figure in social and sporting circles. This scion of the house of Braganza was born six weeks before his father's coronation as King Dom Carlos and was not yet nineteen when his father and elder brother, Crown Prince Louis, were assassinated in Lisbon, February 1, 1908.

With no aptitude for statecraft at a time when the extravagance of his predecessor and the incompetence of his advisors had brought his country to the brink of ruin, he soon fell a victim to a popular uprising which made of Portugal a republic and of him an exile. He and his mother were royally received in England. The handsome young king whose reign ended in 1910 had been a figure in an alleged escapade with a noted dancer, a choice morsel for the yellow press of the day, but in 1913 he married Princess Augustine, of Hohenzollern, a relative of the former kaiser but a member of the Catholic line of that house.

His mother, Queen Amelie, still a very beautiful woman, is *persona grata* with the royal social set, as press photographs from England testify. The Portuguese revolution has always had an odd look, for at the time of Manuel's overthrow he was not unpopular. Some significance is attached to the fact that it has become increasingly apparent that the republic of Portugal is practically a dependency of Great Britain.

The possibility or the desirability of a restoration of the czarist régime in Russia is open to much question. Questions don't bother royal aspirants. Ways and means are the *sine qua non.* Means at least must have been found by the remnant of surviving Romanoffs. For several months reports have crossed the Atlantic that a following is rallying to the support of Grand Duke Cyril, a cousin of the late Nicholas II, but no inkling of definite plans to bring about a restoration of that ill-fated dynasty have leaked out, although a subscription list is said to be in active circulation.

A royal house older than any other in Europe came to an abrupt and inglorious end in the year 1922, when Sultan Mohammed (or Mehmed) VI stole secretly from his palace in Constantinople and, it is reported, sought safety on a British warship. With the collapse of Turkey in 1918 the Allies occupied Constantinople and reduced the government of the Ottoman Empire to a shell maintained for treaty ratification. The aged Sultan bowed to the inevitable, but all that was virile in the land rallied to the aid of the nationalist movement in Anatolia. The bickerings and the duplicity of the conquerors bore their natural fruit and the Kemalists "came back" triumphant. The Sublime Porte, last of a line dating from the eleventh century, deserted his post, leaving Turkey without a sultan and the Islam world without a spiritual head. Shortly thereafter the national assembly at Angora abolished the sultanate but named a caliph who should henceforth exercise only religious authority. At Lausanne, last July, the powers of Europe accepted the Kemalists as the masters of Turkey, nor did either party clamor for the surrender, trial, punishment or other disposition of the former Sultan. His present whereabouts and condition are unknown to the present writer and a matter of indifference to the world at large.

But one deposed monarch remains to be mentioned, and he very briefly. King George II, of Greece, is visiting his wife's people upon the invitation of his government and it is generally understood that his absence is to be permanent. His father, King Constantine, was deposed twice and died in exile. The son is said never to have liked his kingly job anyway, and while Rumania, his present abode, may not feel inclined to adopt her royal in-laws, it is not at all probable that so astute a statesman as one E. Venizelos, who, it would seem, now holds the fate of Greece in his hands, will be ungracious in such a crisis.

The passing of the house of Glucksburg may seem so gratifying to him that he will provide its survivors with liberal pensions. Though Greece is in financial straits, the tax on the national treasury may be somewhat lightened by the fact that two members of the royal family have been well provided for through their marriages into a wealthy American family.

Lincoln's Freeport Speech Sounded Knell of Slavery

Concluded from page 5

candidate, John C. Fremont, unknown in politics but with the reputation as an explorer in the West, in the field. To conciliate Northern hostility on the Kansas question, James Buchanan, the Democratic nominee, repeatedly declared in unqualified terms that if elected he would secure a fair and free vote in the territory. The ballots of the solid South placed him in office.

Two days after President Buchanan's inauguration came the stupefying decision of the Supreme Court in the Dred Scott case, announcing that Congress had no power to prohibit slavery in any territory. To Republicans this was a blow which hurried the country toward the Civil War.

Slavery leaders attempted a coup in Kansas by framing an instrument which provided for the establishment and perpetuation of slavery. When the free-state people of Kansas submitted the entire constitution in a second election, January 4, 1858, it was overwhelmed.

In state convention at Springfield, June 16, the Republican party of Illinois declared that "Abraham Lincoln is the first and only choice of the Republicans of Illinois for the United States Senate as the successor of Stephen A. Douglas." Within a few hours he appeared before the convention and accepted the nomination in his ever-famous "house divided against itself" speech.

Leaving his home in Chicago, Senator Douglas immediately set out for a tour of the state. Lincoln followed the route of Douglas. Political acrimony became so bitter over this practice, however, that on July 24, Lincoln sent Douglas a challenge to joint debates. It was accepted.

An agreement was reached that the speakers were to introduce the debates alternately, Douglas securing the first opening by his own stipulation.

The first debate was at Ottawa. The address of neither speaker at the first meeting was in good form. It was to Freeport that all eyes were now turned. Here Lincoln must reply to questions propounded by Judge Douglas at Ottawa and here he promised "to pay Douglas back in kind."

Politics now became the all-engrossing interest in Illinois. The meeting place was crowded with vociferous followers of each camp—talking, discussing, arguing. Country bands furnished music; the streets were gaily decorated; mendicant peddlers were shouting their wares; the throng was noisy—demonstrative as a college football delegation of our own day.

In the forenoon the debate grounds were crowded. Great difficulty was experienced by the speakers in reaching the platform. Then for the first time in his campaign Lincoln stepped before the audience with an air of superiority. He could scarcely await the opportunity of putting his question: "Can the people of a United States territory, in any lawful way, against the wish of any citizen of the United States, exclude slavery from its limits, prior to the adoption of a state constitution?"

Without hesitation, Douglas answered as Lincoln's friends predicted. His followers were jubilant.

"In my opinion," replied Judge Douglas, with an air of artful confidence, "the people of a territory can by lawful means exclude slavery from their limits prior to the formation of a state constitution. It matters not which way the Supreme Court may hereafter decide as the abstract question whether slavery may go into the territory under the Constitution, the people have the lawful means to exclude it or to introduce it as they please, for the reason that slavery cannot exist a day or an hour anywhere unless it is supported by local police regulations."

Prophet and politician had clashed in reasoning. The purpose of Lincoln in asking this question was to force Douglas either to abandon the Dred Scott decision, that slavery could not be excluded from a territory, or his "popular sovereignty" doctrine that the people of a territory had the right to regulate their own affairs. No matter which way Senator Douglas would answer, the result would be damaging to his future aspirations. Among Democratic leaders in both North and South he was looked upon as the probable Democratic candidate for the Presidency in 1860. His answer was a refutation of the Dred Scott decision, to which the South clung with tenacious hope. It was a blow to the power of the slaveholder. The "Freeport doctrine," as it is now called, sundered the Democratic party. From newspaper and forum in the South, Douglas was immediately denounced as an "apostate." Meantime, the Northern press sounded praises of Lincoln, not a few predicting that he would lead the Republican party in the Presidential campaign of 1860. The other debates did not change events.

Douglas made 130 speeches and expended $80,000, compared with $1,000 spent by Lincoln.

Douglas was elected Senator by a majority of eight legislative votes. Lincoln had won a popular majority, the total Republican vote cast being 126,084 to 121,940 for the Douglas ticket.

"It hurt too bad to laugh and I am too big to cry," was Lincoln's only comment on the election.

Upon the return of Senator Douglas to Washington, however, he found that he had been deposed by Jefferson Davis from the important territorial committee chairmanship because of the "Freeport Heresy." There was to be no compromise over the schism.

Those who had felt that Lincoln had thrown away his chances for political preferment, when he propounded the "Freeport doctrine" realized their mistake with the disruption of the Democratic convention at Charlestown, South Carolina, in 1860. Southern delegates refused to support Senator Douglas for the Presidency because of his answer to Lincoln's question in the Freeport debate.

"Do you recall the argument we had on the way up to Freeport two years ago over the question I was going to ask Judge Douglas?" Lincoln asked Joseph Medill, when the latter went up to visit the President-elect at Springfield.

"Yes," said Medill, "I recollect it very well."

"Don't you think I was right now?"

"We were both right," retorted Medill. "The question hurt Douglas for the Presidency, but it lost you the Senatorship."

"Yes, and I have won the place that he was playing for," was Lincoln's ready answer.

Not for a moment did Senator Douglas sulk. Partisan became patriot. With the opening of the Lincoln Administration he offered loyal support, and when the crisis of Fort Sumter came, he conferred with the President and then returned to Illinois to place the Douglas democracy of the Mississippi Valley solidly behind the Union cause. He died as the result of fatigue and exposure on this western trip and was buried at Chicago.

Freeport is no longer the prairie town of sixty-five years ago. Only a few landmarks remain. But with the decades, interest in the debate grounds has increased until the spot has become a national shrine. It has been marked by a monument quarried from the age-old hills of Devil's Lake, Wisconsin. About this shrine, people gather on patriotic occasions; to all passers who read its bronzed tablet it becomes a benediction for higher ideals of citizenship and service.

A quarter million dollars' damage was sustained by the *Leviathan* when it grounded on a harbor bar at New York recently.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

American artists are incensed at what appears to be discrimination on the part of the French who have relegated to a small Paris museum Whistler's famous painting, "Arrangement in Gray and Black," a portrait of his mother. According to established custom, a decade after the death of the artist his best paintings are removed to the Louvre. Whistler has been dead two decades.

Only one railway accident involved loss of life in England during 1923. The years 1901 and 1908 were without a single fatal accident to passengers. In the 23 years of the present century the number of railway deaths totals but 73.

The last 15 years have seen 26,297 railway collisions in the United States: Deaths, 4,326; Injured, 60,682.

Dollar bootleggers in Paris offer to buy dollars at prices ranging from 50 centimes to 1 franc above the previous night's official closing quotation. Plainclothes policemen watch for these dealers, who are "foreigners, from somewhere in Central Europe."

"After being away on a lecture trip in the interior, I return each time to Manhattan as to a foreign port. The people in the street appear mean in stature and brutal in manner. It is in the small towns of Ohio, Indiana, and Illinois that I overtake the vanishing America of my youth."—*Hamlin Garland.*

The United States Army bakes bread for two cents a loaf, superior to that sold the public for nine and eleven cents.

Radio "Fans" must pay to "listen in" in Australia. Every purchaser of a receiving set must present a license showing that he has subscribed and paid for the service of the station operating on the wave length to which the instrument being purchased is adjusted. For every broadcasting station he wishes to use, he pays separately. The sets are sealed and government inspectors investigate and check up the subscriber to see that seals have not been tampered with.

A lion gnawed the wood away from two iron bars in his cage and roamed free in two connecting express cars on a Santa Fe passenger train near Kansas City, Missouri. He was captured by the superintendent of a park zoo at Kansas City who lassoed the animal and pulled it into a waiting cage.

The theory by which English Channel fishermen explain their poor catches, is that the fish have been poisoned by the dumping in the sea of unused munitions. Small quantities of arsenic have been found in oysters on the east and south coast.

The Petrograd mint has resumed the coinage of gold, silver, and copper currency, it is reported.

With yards braced sharply to starboard an old-time barkentine lay in the harbor at Baltimore while her skipper scoured the waterfront for old-time seamen capable of handling a ship of her type. The seamen of the younger generation can handle a schooner, but a barkentine is different.

"Faith and toil and helping one another." These seven words form the plan for international peace submitted by Anton Lang, Christus of the Oberammergau Passion Play, to Edward W. Bok.

The saying, "Mind your P's and Q's," meaning "Be very careful," originated in printing offices. When type is set up the letters are reversed, and small "p's" and "q's" were liable to be mistaken for each other. Machine typesetting has made the warning obsolete.

The transportation problem in Tokyo is acute. Hundreds of street cars were burned during the recent quake.

A young French archeologist, swimming into the recesses of a partially submerged cave near St. Martory, France, found valuable secrets. Keeping his matches and candles dry by means of a special contrivance he swam nearly a mile, resting on rocks en route, when he reached a dry gallery 200 yards long, the walls of which were covered with inscriptions and age-old drawings, together with statues of animals that disappeared from the earth thousands of years ago.

The children of Japan are taught to reverence the emperor as a semi-divine being. The present Prince Regent, having traveled extensively in European countries, favors more democratic practices with regard to the imperial Japanese family.

The Malays for centuries have domesticated monkeys and have trained them to climb cocoanut trees and pick the nuts.

Lessons From Co-operative Movement in Europe

Federal Trade Commissioner Presents Analysis After Personal Study

By HUSTON THOMPSON

With this number, Huston Thompson, formerly Assistant Attorney-General of the United States, and now a member of the Federal Trade Commission, begins a series of eight articles, entitled, "Lessons from the Co-operative Movements in Europe."

In his survey of this subject, Mr. Thompson visited the central offices of most of the leading national and numerous local co-operative societies in fifteen European countries. He interviewed directors, managers and employes of wholesale and retail consumers and farmers' co-operatives, and co-operative banks. He also investigated their manufacturing plants, warehouses, wholesale and retail shops, farms, dairies, public markets, over-sea export plants, co-operative schools and publicity and propaganda departments.

The next number will deal with the Agricultural Co-operative Movement in Ireland and England.

HUSTON THOMPSON

I WAS sitting in the darkness of a cinema theater in London watching a motion picture when the lady usher, with a rising intonation, said: "Tea?" My surprise and ignorance were such, because we Americans take our motion pictures so seriously and concentrate on them with a deathlike silence, that I replied: "No!" But not so my neighbors, who answered in the affirmative. And since they affirmed all over the house, there was a clatter of spoons and saucers in competition with the noise of the projecting machine and the flickering picture.

A little later in the afternoon, on my visit to Parliament, as my host approached me from the floor, the first question he put was, "Will you have tea?" We retired to the tea room below. The initial interrogatory in the clubs in Glasgow was, "Tea?" When I entered the office of a large mercantile concern in the afternoon in Edinburgh, I was hardly seated before they served tea to me. In Belfast, I was offered tea before twelve o'clock. I saw children picnickers on the tops of busses and in cars carrying tea, and everywhere we went the clerks at the tea hour had theirs.

Now it is difficult to imagine that an article so universally used would not be the subject of attempted manipulation in the way of monopoly or price control, so that the housewife would have no choice in shopping about for the commodity. There may be in the British Isles some attempt at control of this article, but the attempt could not be successful because there is always standing near the market place a powerful organization so large that in the business arena it can check a rising price if it sees fit.

Own Their Plantations

ITS leaders assert that it is the largest tea importer, mixer and distributor in the world, with an output of sixty million pounds a year, and such a factor in the market that it necessarily has an effect upon prices.

I learned later on in my trip that this single unit of the Co-operatives, which occupies one of the largest buildings in the city of London, ships tea to co-operative organizations in the farthest reaches of Continental Europe.

It is the owner of tea plantations in Ceylon that already produce one-tenth of its requirements. It has become one of the largest millers of flour and supplies grain in part from wheat farms in Canada covering ten thousand acres.

This organization is called by various names, but for the purpose of these articles I have called it the Consumers' Co-operative Organization, since, strictly speaking, its membership is really confined to consumers.

This association of urban consumers—they mostly reside in the cities and congested areas of population—have a great organization in Scotland with a wholesale department located at Glasgow, which in turn supplies the needs of consumers' local societies in Ireland. The central headquarters of England are located in Manchester. These organizations serve, either in whole or in part, perhaps one-third of the people of the British Isles.

Because of the obvious importance of this movement, one would think that all classes in England and many people in the United States would have at least a cursory knowledge of this, the biggest marketing organization in the world. At least I thought so and when about to start on my investigation I broached the subject to several of the best informed newspapermen in the city of Washington, each of whom had been abroad more than once, but failed to elicit even a hint about this movement.

The ship on which I took passage had mostly English and Scotch business men on board. Like Diogenes, I sought out each of them and asked for light on this subject. There was but meager information to be had. The best I could get was that the movement was confined to the poorer classes. This proved true in part. It does not extend to all of the poorer classes, but exists almost entirely within the limits of the artisan class of the British Isles.

I was also informed that the officers and men in control of this movement were workingmen who had practically no business experience, and that the whole scheme was not much of a success.

When I landed in England, I interrogated all sorts of people in the middle and upper classes. They were not in the least embarrassed in expressing an ignorance or indifference of this movement that was nothing short of amazing when one considers its history, its tremendous size, and present potency in the economic world.

In fourscore years, it has emerged from its inception in a room in a small brick store in Toad Lane, Rochdale, near Manchester, England, to massive granite buildings that cover solid blocks of English cities.

On a rainy day in June, I stood on the other side of Toad Lane, and looked across to the humble place where the twenty-eight weavers in Rochdale, eighty years ago, set up an organization for purchasing the necessaries of life in quantities, with the double purpose of securing the wholesale price and obtaining the unadulterated article for resale to their members. They proposed also to distribute to their members whatever savings accrued through the elimination of the middleman's expenses. In twenty minutes, an automobile had whisked me to Manchester, where I looked down a street of buildings five stories high and covering acres of land that housed only a part of the wholesale business of the British Consumers' Co-operatives and but a very small part of their manufacturing business. This movement has not stopped merely with buying in wholesale quantities and distributing through its hundreds of retail stores scattered over Great Britain, but it is now one of the leading shoe manufacturers in the United Kingdom as well as one of the largest single distributors of coal, having eliminated that troublesome question of the pyramiding of brokerage fees which is so pressing a question with us.

It puts up jams, preserves fruits, makes flour, bakes bread, runs dairies, manufactures shoes and other necessaries, and employs in its wholesale plants alone approximately forty-six thousand persons. It has five million members. Most of these five million are housewives of large families averaging at least four, so that it is safe to say that the movement touches directly and to some extent the pocket nerve of twenty million persons.

Although I had read of its size before leaving America, I could not grasp the full significance of it until I saw with my own eyes the physical properties of these consumers' organizations. Then it was that I became even more amazed that the average business man knew so little about this great brother of his.

In Manchester, one of the heads of the Holyoake House, the organization which organizes co-operative units, resurrects the dead organizations, and gives sustenance to the weak, pointing to the great wholesale co-operative buildings across the street, said:

"You Americans rush over here, behold these buildings and immediately exclaim, 'That's what we want,' and at once you begin to plan a wholesale co-operative organization on a great scale.

Must Start in Small Way

"I DOUBT if you will ever succeed in this way. You must first start with the small local co-operative purchasing units in neighborhoods where the housewife or ultimate consumer is subjected to economic pressure, and where the saving of pennies is a matter of vital necessity in their lives. There you will find the real stimulus that produces co-operation. When they are organized and you have banded a number of such units together and they have elected their board of directors; when a woman's guild has been joined to them to teach the housewife the co-operative idea, since the 'woman with the basket' is the real co-operator, and the units have opened up their stores and are doing business, and the demand for greater expansion in wholesale buying is insistent, then you will be ready to consider putting up buildings like these. *In other words, you must organize from the bottom up, instead of from the top down.*"

"Well," I replied, "your plan is much like the Billy Sunday evangelistic movement; first the cottage prayer meetings, then the great meetings, with Billy Sunday offering the gospel on a wholesale plan and a school of instruction to follow along and keep the work alive."

"Righto!" said my auditor.

The way of the consumers' co-operative has not been a bed of roses by any means. Organized primarily for cheaper buying and the elimination of adulterated goods, it soon stepped on the toes of some private business and felt the consequent reaction. The competition of private business has from time to time drawn its weaker members away. Cheaper prices and bargain sales prove too strong an allurement for some, while the appeal of thrift ceases to hold them when success and fortune come their way.

In order to meet the competition of private business, it is obvious that the British co-operatives were compelled to convince their members that purchasing through them meant saving. Private business universally contends that the co-operatives do not sell cheaper to their members than does the individual organization to its clientele.

While on the surface, and in the first instance, the co-operatives do not appear to sell at lower prices, it being their custom to sell at or near the market price, yet at the end of the year the housewife draws her dividend from the co-operative organization which represents her share of the saving produced through the elimination of the middleman's expenses and through wholesale purchasing in association with others. When this saving is subtracted from the price she has paid, she undoubtedly has got her purchases at a cheaper price than if she had bought from a private retailer. If it were otherwise, how could the system have grown to such enormous proportions? The only possible assurance of cohesion in such an organization is in the proof of money saved.

It was pressed upon me by private concerns that the housewife in the first instance really paid a higher price than if she had bought at a retailer's store, and that her dividend was the difference between the high price she paid and what she would have paid if she had purchased from the private concern. But such a state of facts could not continue to exist with the shrewd British housewife who is as wise a shopper as there is in any land, and whose pocketbook is so far from full that she has daily to watch its contents with great concern.

When Carelessness Creeps in

THIS co-operative movement also meets with another great obstacle, such as confronts trusts and governments. It finds a constant problem in the size of its organization. Its great size is both a virtue and a weakness. When an association, whether of business or government, has passed the point where the mind of a single individual can encompass its complexity of functions, efficiency wanes. When the number of human units associated in an enterprise runs into the thousands, the valuable personal equation is bound to be lost, or submerged to some extent. At this juncture carelessness steps across the threshold of the co-operative, just as it does in the bureaucracy of government and big business.

This fact the co-operatives do not hesitate to admit. In fact, they are constantly studying how to meet it, and at Holyoake House there is a laboratory for analyzing, checking and eliminating the causes. In education they expect to find the solution, so they send out teachers to instruct and inspire the members in co-operative ideals. Besides, they keep check on the local societies through sending auditors from time to time to go over their books.

Moreover, the movement has now reached such a size that it faces a rather complicated task in the handling of the employes who perform its labors, who, as already said, number about forty-six thousand.

The day I arrived at Liverpool, a part of the wholesale unit of the co-operative movement, though just recovering from the business lapse after the war that had seriously affected them as well as private business, was confronted with a strike that drew out about eight thousand of their employes and threatened to bring them all out. The press has since reported that the strike has been settled.

Our co-operative friends informed us that they universally paid above the scale of prices demanded by the trade unions, and the requirements fixed by a government commission, composed of representatives of the co-operatives and employes, and a government representative. In spite of this, the one big union of the co-operative workers refused to accept the cut in their present wage scale proposed by the commission.

Undoubtedly a solution will be found for this problem. Some people such as Father Finlay, one of the leading co-operators of Ireland, suggested to me that the co-operators go back to the old method, once said to have been in vogue in Scotland, of permitting the employe to share in the annual savings of the organization on a scale proportionate to the work he has done as expressed by the sum total of his salary, just as they permit a member to share in the dividends or savings in proportion to the amount he has bought. This, it is argued, would tie the employe to the movement in a more intimate and personal way, and eliminate strikes.

This suggested remedy is not a new one, having been tried in the United States. I have heard it condemned by enthusiastic co-operators. If the consumers' co-operative idea continues to grow in America, it will undoubtedly have to meet the same problem on a big scale. It is a curious commentary on the situation that while practically all the members of these co-operative organizations are either members of trade unions or the wives of members, they should be confronted with a strike of the employes of their own organization.

Moreover, there is a criticism on the part of some members of the co-operative organizations because the movement is confined to the artisan class, and not to the poorer and unskilled. I found that successful consumers' co-operatives in other countries appeal to a far wider group than that represented by the artisan class in England.

There are other minor criticisms which might be arrayed against the movement if one were to be hypercritical, but these are more than offset by a large number of benefits.

First of all, and I wish to emphasize this, the business of the co-operative is open business, openly arrived at. Does the investigator wish to examine their latest balance sheet, the touch of a bell brings that telltale document. He may desire to know the difficulties

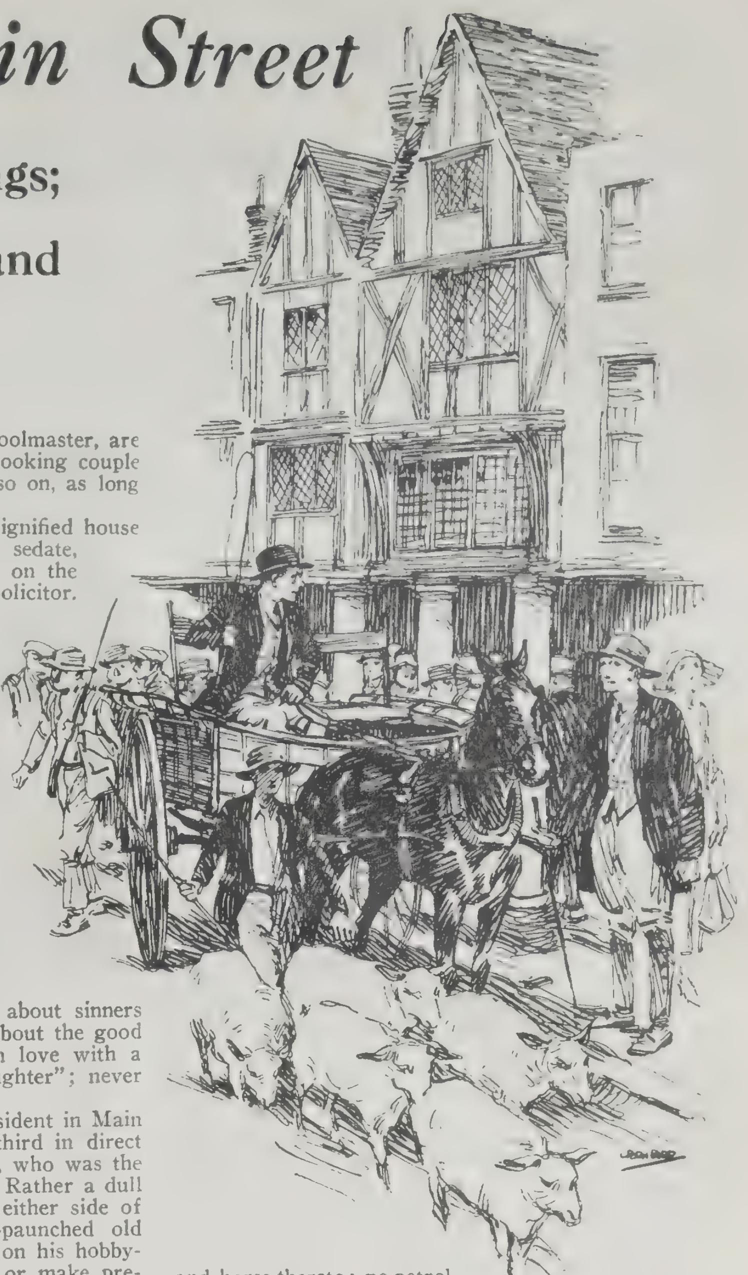
The Sunny Side of Main Street

Old Friends Meet to Chatter of Nothings; A Picture of Main Street of Old England

By W. TEIGNMOUTH SHORE



I.

IT IS many a year ago since first I walked down Main Street, in Old England; as a wayfarer from London, I am a Main Streeter by adventure, not by birth. With Main Street, America, I am also acquainted; but it is of a Main Street in the west of England that I am now chiefly thinking. What matters it where exactly it is? Main Street everywhere is much of a muchness, is it not? Mentally at any rate.

Will you come and walk with me in Main Street, Old England?

It is a hot summer morning; the air is dancing with the heat. I saunter along the shady side of Main Street, which is as lazy and drowsy as I am myself. I hear the chimes in the gray cathedral tower sound the hour of noon; twelve heavy strokes on the great resounding bell, and then the carillon playing the first bars of *Adeste Fideles.* I have come out of the somber church, where I have been sitting near the west door, under the famous window through which the light falls many-colored upon the tall pillars; I listened to a distant voice reading Morning Prayers, to the singing of the choir, to the sonorous tones of the organ echoing in the dim, gray-fretted vaults high above. Then I came out through the north door, tumultuous with crumbling carvings and resonant with the cooing of pigeons. Then a few paces and I am in Main Street, which in England we call High Street.

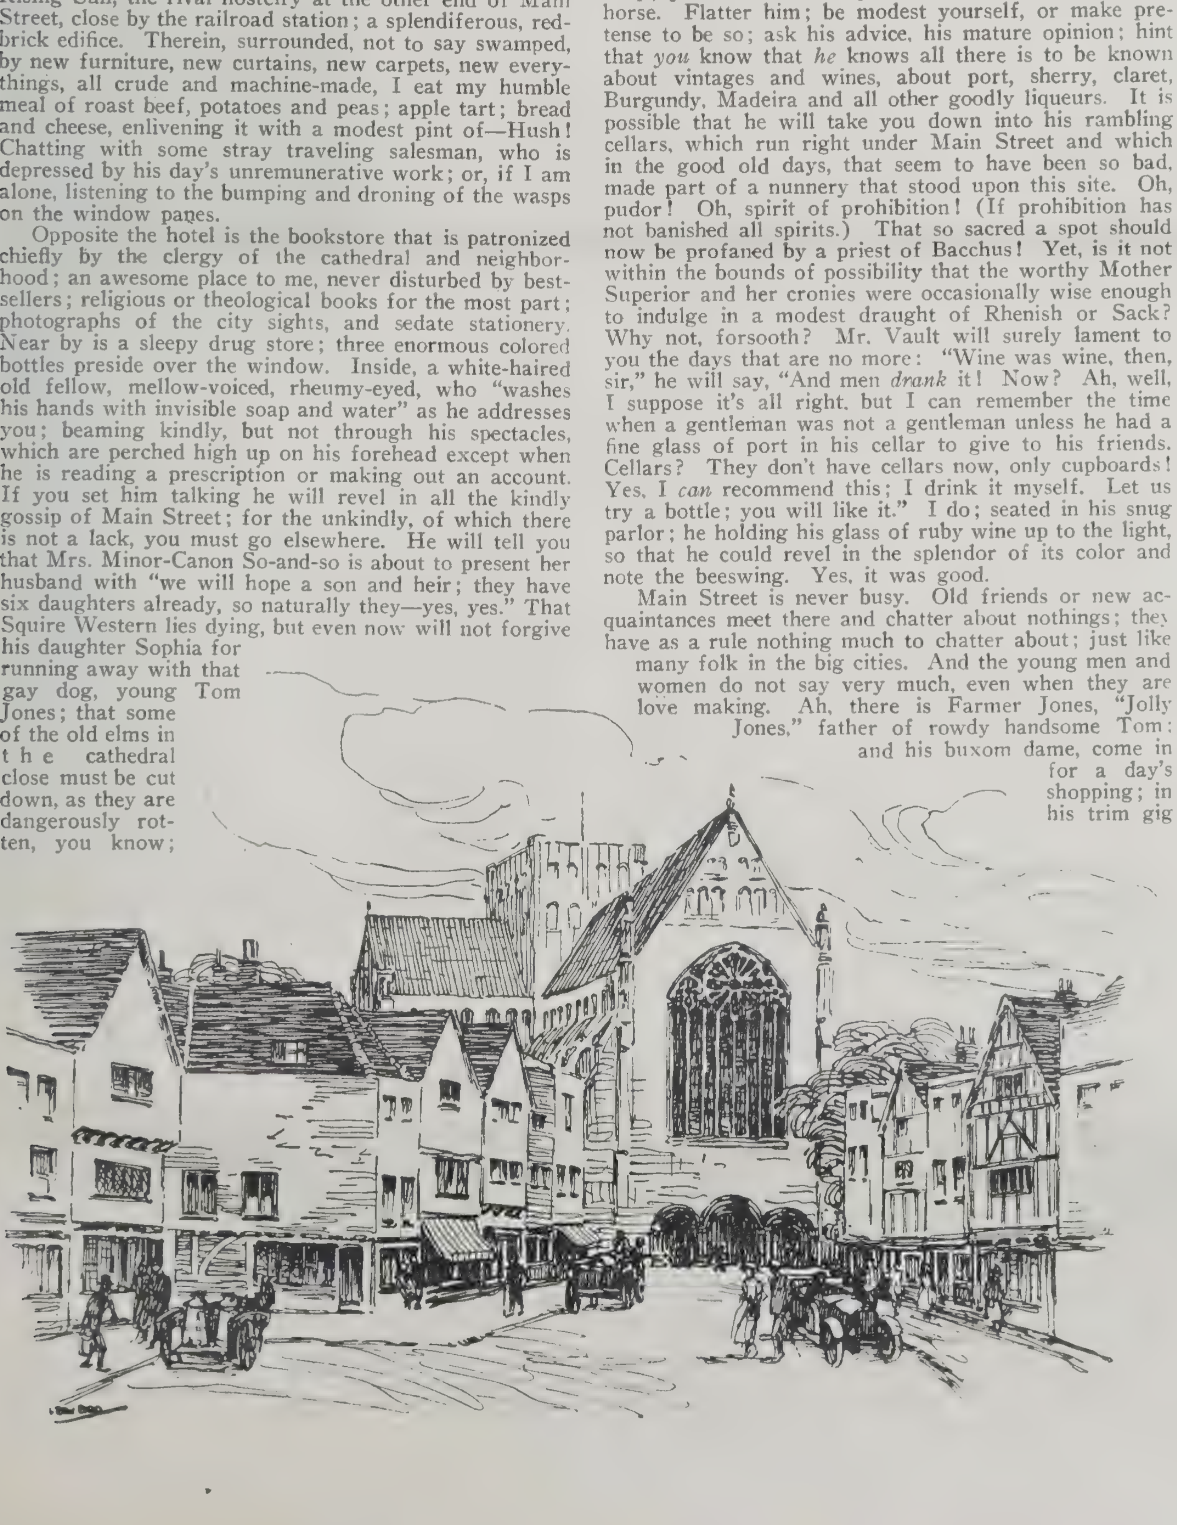
A long, narrow thoroughfare; here and there ancient half-timbered houses stooping over the sidewalk as they have done for centuries. And a few private houses; but for the most part sleepy stores, with shades down on the sunny side of the way to keep out the sunshine. At one of the corners facing the cathedral is the County Hotel; it has a long and somnolent history; it is dull, dreary, awfully respectable; it is patronized by the old-fashioned county folk. I never knew anyone who stayed there; was never there myself. I put up at the Rising Sun, the rival hostelry at the other end of Main Street, close by the railroad station; a splendiferous, red-brick edifice. Therein, surrounded, not to say swamped, by new furniture, new curtains, new carpets, new everythings, all crude and machine-made, I eat my humble meal of roast beef, potatoes and peas; apple tart; bread and cheese, enlivening it with a modest pint of—Hush! Chatting with some stray traveling salesman, who is depressed by his day's unremunerative work; or, if I am alone, listening to the bumping and droning of the wasps on the window panes.

Opposite the hotel is the bookstore that is patronized chiefly by the clergy of the cathedral and neighborhood; an awesome place to me, never disturbed by best-sellers; religious or theological books for the most part; photographs of the city sights, and sedate stationery. Near by is a sleepy drug store; three enormous colored bottles preside over the window. Inside, a white-haired old fellow, mellow-voiced, rheumy-eyed, who "washes his hands with invisible soap and water" as he addresses you; beaming kindly, but not through his spectacles, which are perched high up on his forehead except when he is reading a prescription or making out an account. If you set him talking he will revel in all the kindly gossip of Main Street; for the unkindly, of which there is not a lack, you must go elsewhere. He will tell you that Mrs. Minor-Canon So-and-so is about to present her husband with "we will hope a son and heir; they have six daughters already, so naturally they—yes, yes." That Squire Western lies dying, but even now will not forgive his daughter Sophia for running away with that gay dog, young Tom Jones; that some of the old elms in the cathedral close must be cut down, as they are dangerously rotten, you know; that Miss Rose and Mr. William, the schoolmaster, are going to make a match of it and a nice looking couple they'll be; that "I heard last night" and so on, as long as you care to listen.

A little farther down the street is a dignified house built in the reign of dull Queen Anne; sedate, sober; with a highly polished brass plate on the door, bearing the name of Mr. Knowell, Solicitor. He will carry to his grave the many secrets that he holds. On the japanned tin boxes on the shelves of his dusky office appear the names of many well-known county and city families; and in them, gathering dust and drifting toward oblivion, lie hidden many sorrowful stories, many tragic tales. Histories of rich and powerful houses that have descended slowly, surely to decay and poverty; records of broken hearts, of unhappy children and unkind parents; of sons who have gone to the deuce and of daughters who have ridden away to the devil; of crimes and follies. But not all so; stories of the course of true love that did run smooth are here, and records of heroism and brave deeds. But is there not a greater savor of romance about sinners than saints? I never myself care much about the good boy of the family; have never fallen in love with a girl who always did exactly as she "oughter"; never will!

Another well-known and well-to-do resident in Main Street is Mr. Vault, the wine merchant, third in direct descent from the founder of the business, who was the retired butler of "a three-bottle" bishop. Rather a dull house his, with latticed bay windows on either side of the entrance. A short, rubicund, well-paunched old chap; pleasant withal if you can set him on his hobby-horse. Flatter him; be modest yourself, or make pretense to be so; ask his advice, his mature opinion; hint that *you* know that *he* knows all there is to be known about vintages and wines, about port, sherry, claret, Burgundy, Madeira and all other goodly liqueurs. It is possible that he will take you down into his rambling cellars, which run right under Main Street and which in the good old days, that seem to have been so bad, made part of a nunnery that stood upon this site. Oh, pudor! Oh, spirit of prohibition! (If prohibition has not banished all spirits.) That so sacred a spot should now be profaned by a priest of Bacchus! Yet, is it not within the bounds of possibility that the worthy Mother Superior and her cronies were occasionally wise enough to indulge in a modest draught of Rhenish or Sack? Why not, forsooth? Mr. Vault will surely lament to you the days that are no more: "Wine was wine, then, sir," he will say, "And men *drank* it! Now? Ah, well, I suppose it's all right, but I can remember the time when a gentleman was not a gentleman unless he had a fine glass of port in his cellar to give to his friends. Cellars? They don't have cellars now, only cupboards! Yes, I *can* recommend this; I drink it myself. Let us try a bottle; you will like it." I do; seated in his snug parlor; he holding his glass of ruby wine up to the light, so that he could revel in the splendor of its color and note the beeswing. Yes, it was good.

Main Street is never busy. Old friends or new acquaintances meet there and chatter about nothings; they have as a rule nothing much to chatter about; just like many folk in the big cities. And the young men and women do not say very much, even when they are love making. Ah, there is Farmer Jones, "Jolly Jones," father of rowdy handsome Tom; and his buxom dame, come in for a day's shopping; in his trim gig and horse thereto; no petrol-shays for him, dang'em.



And over the way is Farmer Brown, smart, handsome, maybe a bit wicked; at whom many a pretty girl is setting her cap; he is in an auto which he drives desperately. There on a spirited mare is gay young Lady Susan, with her brother on his pony; she is a bit out of place in Main Street, where she seldom makes an appearance; the old family house outside the city is dismal; she prefers London in the Season, then the Isle of Wight or Switzerland, and the South of France in winter.

There is not very much doing here except on Market Day each week, when there is a bit of a stir. Then there is a great exchange of goods and gossip. The younger folk will listen greedily to Madame Rumor, when she tells them that William Brightman, who ran off to Manchester—or was it Liverpool?—it was in 1897, wasn't it?—is a big man now; made a lot of money during the war. And that Frank Morton, lazy young dog, who was always half asleep; you know he went to London without more than enough to pay his fare there; not a penny in his pocket and hadn't even paid for his trousers; well, he's writing books, they say, and being paid for'm! To many a Main Streeter the pavements of London still sparkle with gold! And, you remember Mary? Pretty? Nobody said she wasn't, but—well—. She's gone to America, they say, where they make the picture plays, and she's earning a hundred dollars a week; a week, mind you. And they say that Mr. Bullion hasn't been doing none too well lately, and—well, we shall see. "They" say; I often wonder who "they" are. "They" are the rulers of the roost in Main Street; "they" know all about everybody's private affairs and a great deal more. Of course, "they" say a lot about *me* behind my back, not always over kindly; but what matters it to me? I do not live in Main Street, but in London, where we never say nasty things about our friends and enemies.

II.

Of the many others there is one other Main Street that I know well; it is in the midland part of England. A small, prosperous, progressive manufacturing town; set amid beautiful scenery which is rapidly being destroyed by the encroachments of ugly factories, mills and equally unbeautiful rows of small dwelling places. I can remember the time when the little river ran modestly, shyly, between grassy banks, fringed with forget-me-nots and flags, shaded here and there by stooping willows and blackthorn bushes. It is now tainted by refuse and the water weeds are slimy with filth. A few years ago this town was a small village; there still remains the old-fashioned inn, now swept and garnished and lighted by electricity in place of smelly oil lamps hanging from the dingy-white plaster ceiling; jovial mine host has gone and a smart manager reigns in his stead. And the weather-beaten village church and the o'er full God's acre round it. Off Main Street here and there are many mean streets; poor dwellings of hard-working men, women and children, who spend long hours in stultifying labor in factory and mill. The atmosphere here resounds with the jingle of moneymaking; the town is proud of its prosperity. But was it not happier when it was young?

There are several brand new saloons, all plate glass

Gaslight Going the Way of the Tallow Candle?

How the Mantle Has So Far Saved the Fleeting Life of Illuminating Gas

By CHARLES ALBERT COLLMAN

IS GASLIGHT going the way of the tallow dip of our grandfathers? In other words, is gas becoming obsolete for illuminating purposes? When I addressed this question to an official of a large lighting corporation in New York City, who is regarded as being one of the best posted men on the subject, he responded quickly:

"The thing that saved us was the gas mantle. Gas would have been gone from us but for that. Mind you, I am speaking of illuminating gas. Gas is thriving in its use in industries, where it is broadening out into wide varieties of utility, and for domestic purposes, in cooking and heating, it still holds a well-established position."

In gas manufacturing circles, the passing of gas as a lighting medium has been a matter of serious debate for the last year or so. Men qualified to speak on this subject have been advising gas men on the adoption of new methods of enterprise. The head of a representative technical organization not so many months ago issued a pessimistic statement on the future of gas as an illuminant, and later an expert addressing members of a gas sales association in Boston warned his hearers of the "handwriting on the wall," which he exhibited in the form of a lantern screen, on which he threw statements and figures indicating the decline in the consumption of gas in the lighting industry.

The first gas company in the United States was chartered in Baltimore in 1816, and in 1822 the city of Boston adopted gas lighting. The making of gas was an expensive process in the early days, the initial product being from the distillation of English coals. The price of gas in New Orleans between the years 1836 and 1840 was as high as seven dollars a thousand cubic feet. It was during this period, however, that the gas industry became an important one in the United States, and, as its output became more widely utilized for lighting purposes, the manufacturing costs fell lower and lower. Finally water gas succeeded to the manufacture of gas made solely from coal and the cost of manufacture was infinitely lessened. Carbureted water gas is now the most important product of the gas industry, both in quantity and value. The Consolidated Gas Company of New York last year used only 739,000 tons of coal, as compared with 133,000,000 gallons of gas oil. Three-fourths of the amount of gas it manufactures is water gas. The country's combined output of water gas in 1921 approximated 206 billion cubic feet, as compared with sixty-two billion cubic feet of coal gas.

Uses Have Changed

BUT since the advent of electricity and the introduction of cheap electric lighting, a vast change has come about in the consumption of manufactured gas. Only about twenty years ago gas lighting was the rule, and electric lighting was regarded as more or less of a luxury in which only wealthy folk could indulge. Nowadays, illuminating gas is unable to hold its own in competition with electricity in most of the urban centers. Just as the flickering gaslight on the street corner is a reminder of a bygone age, so gas is gradually vanishing as a medium for lighting the home, and, in fact, homes and communities that are beyond the reach of gas mains are now enabled to enjoy electric illumination at a moderately low cost.

It is true that production figures show that the manufacture and consumption of artificial gas are still on the increase. But the increased production is compelled to seek new avenues of usefulness, while abandoning the old and traditional field of lighting factory, office and home. The output of artificial gas has more than trebled in the last twenty years, having risen from 100 billion cubic feet to more than 360 billion cubic feet. But the gradual change in its use and application is pretty well demonstrated in the following table:

Artificial Gas Sold in the United States

Year	Illuminating purposes (Per 1,000 cu. ft.)	Fuel purposes
1898	15,955,149	2,476,052
1905	86,349,641	31,516,599
1908	109,290,116	47,619,192
1915	80,796,873	185,407,375
1917	80,144,649	262,006,480
1920	61,176,000	242,060,000
1921	60,442,000	256,130,900

Out of the total production of artificial gas in the United States, the amount used for illuminating purposes in 1898 was 86.6 per cent. This high percentage declined to 74.3 per cent in 1904. It further declined to 69.7 per cent in 1908. From 1912 to 1917, the use of illuminating gas slumped from 47.1 per cent to 23.4 per cent. In the year 1921, according to estimates made by the American Gas Association, only about 18.5 per cent of manufactured gas output was used for lighting purposes, while 56.7 per cent was utilized for other domestic purposes, mainly heating, and 21.6 per cent was employed in industrial pursuits.

Now only fourteen years ago, the rates of progress in the gas and the electrical industries were very nearly the same. Since that time, the electrical companies have developed five times their former total, while in the same period the total volume of artificial gas has slightly more than doubled. So it is easy to be seen that in competition with the young harnessed giant, electricity, gas has lost the race.

In such circumstances, which are undeniably disheartening to the gas lighting companies, it is to the credit of American salesmanship and business management that disaster was averted from a situation that had become not alone trying but dangerous. It was not only the gas companies and the public utility corporations that had come to a realization of the significant slowing down of the lighting end of their business. This fact was as quickly recognized by a corporation whose interests were as intimately concerned in the situation as were theirs—the company at whose large plant at Gloucester, New Jersey, are manufactured gas mantles, burners and gas appliances generally.

Within the last three or four years it was estimated by the gas industry that there were in use 6,400,000 domestic gas cooking appliances, 1,300,000 gas water heaters and nearly 900,000 gas space heaters, while incandescent mantle burners for gas illumination numbered approximately 10,000,000. By 1921, however, it was suddenly made apparent that, while there had been a doubling of the amount of artificial gas sold within the last ten years, the number of gas lamps served in 1921 numbered only from thirty per cent to fifty per cent of those in use ten years ago.

Then the retail sales management of the Gloucester corporation began to recognize the fact that gas lighting fixtures would no longer sell themselves and that it was up to them to stimulate public interest in their purchase and in the consequent consumption of gas for lighting purposes. While local gas companies were in direct touch with consumers, it was quite evident that it would not be possible for each one of them to create separate local sales organizations. It was thereupon found advisable to have the work of a gas lighting propaganda conducted apparently by the local companies in separate communities, while actually it would have to be carried out by the gas mantle interests themselves. So the gas mantle management adopted the plan of a permanent organization, which was moved from city to city to spread the gospel of gas mantles. The campaign concentrated on a single-light fixture and a semi-indirect lighting fixture for overhead use. Each salesman carried eighteen mantles ready for installation, and it was his business to arouse the interest of housewives in the advantages of brightening the home by installing such fixtures. This campaign was conducted also through newspaper and direct-mail advertising, and it was thus, through the energies and efforts of the gas appliance men, that illuminating gas has survived temporarily the competition of cheap electric lighting.

But it is not only in the figures of gas production and of the use of gas appliances that the decline of gas lighting is made manifest. The inevitable passing of gas as an illuminant is indicated to a still more striking extent in the records and operations of the great gas companies and public utility corporations.

The stocks of gas companies were among the first to become popular investments, and their profits were high in years gone by. The unusual profits of lighting gas companies immediately attracted the attention of capitalists and with the growth of urban population the public utility corporations sprang into being. The urban population of the country grew in a century and a half from two and one-half per cent of the total population to twelve and one-half per cent, and subsequent years increased this percentage to 51.4 per cent of the total inhabitants of the country. Dwellers in cities, towns and villages of the United States in 1920 numbered 51,406,017 as compared with 30,380,433 in the year 1900.

With the growing demand for modern lighting plants in cities and towns throughout the country, large holding corporations were formed in established centers of capital such as New York, Philadelphia and Pittsburgh. These organizations acquired, managed and operated long chains of gas lighting companies in distant states of the Union. The "holding" corporation would sell its stocks and bonds and either construct or purchase the local companies that fell under its control.

Stock Issues Continue

ALL the time-honored evils of overcapitalization and absentee ownership crept into this situation. The New York or Philadelphia bankers and capitalists ruled the lighting conditions of towns and communities in Georgia, Indiana, Kansas, Missouri and more distant states. They had gone into the business to make money, and the comfort and well-being of far-away communities was a subject of lesser concern. The gas companies, whose arrival had at first been welcomed, gradually appeared in a different light to the local communities. Gas rates were high and were frequently boosted to higher figures. Arbitrary methods of the heads of distant holding companies made the local companies decidedly unpopular.

Gas magnates were denounced as extortionate, and municipalities often rebelled against them. Federal anti-trust suits were aimed against them, and state laws forced the reduction of rates. The history of the gas industry of this country for the last twenty years discloses an almost uninterrupted series of lawsuits furthered to compel gas companies to modify the exactions imposed upon helpless communities. The unwisdom of financial managements and their consequent unpopularity undoubtedly also had a great influence in bringing about the gradual abandonment of gas for lighting purposes. Communities welcomed the advent of other concerns that provided cheap electric lighting.

One of the peculiar phases in the gas situation is the fact that although gas lighting is on the decline, and gas production has fallen far behind that of electric power, *yet the issues of gas stocks and other securities are still on the increase.* The stock and bond capitalization of gas companies today approximates one and one-half billion dollars, in the face of the fact that gas companies are numerically growing less. In 1914, there were 1,244 gas companies in the United States, and five years later this number had shrunk to 1,020. The steady increase in the securities of gas companies is indicated in the following table:

Stocks, bonds and other obligations of gas companies.
1916—$1,031,650,000
1920— 1,244 430,000
1922— 1,369,750,000

These security increases have often had an unhealthy effect upon the corporations and have proved unfortunate to the owners of their securities. The case is instanced of the old Consolidated Gas Company of the city of Pittsburgh, which, with the South Side Gas Company, suspended operations in 1919. Holders of $5,000,000 first mortgage bonds, whose interest had been in default since 1916, were obliged to accept preferred stock of the Philadelphia company, a holding concern, subject to all the funded debt of the company and its subsidiaries.

Other companies, made aware of changing conditions, adopted policies by which they combined their business with electric production in their territories. Concerns in New York, Baltimore and Cincinnati were successful in meeting electric competition by themselves supplying the demand for electricity for lighting, while applying their gas production to heating and industrial purposes.

Most of the great holding companies have adopted this plan of protecting their industries by providing both gas and electricity for their light, heat and power enterprises. Their own operations show how gas is being superseded by electricity for lighting purposes.

Among these corporations is the American Light & Traction Company, which, under the conduct of New York capitalists, conducts a large number of gas, lighting and traction companies in Minnesota, Wisconsin, Michigan, New York and New Jersey, including the cities of Detroit, Grand Rapids, Milwaukee and St. Paul. It is capitalized at about $44,000,000. Over a long course of years this corporation pursued what would appear to have been an unwise policy of continual stock increases, which, while it may have been profitable to the financiers identified with the property, has not had a happy outcome for the investors.

Down Come Dividends

THE American Light & Traction Company enjoyed a prosperous business in operating its subsidiaries for a course of years, but in 1909 it adopted a certain policy which caused the market price of its stock to soar. This was a system of paying heavy stock dividends in addition to its ten per cent cash dividends, as follows:

Dividends of the American Light & Traction Company

Year	Cash Div.	Stock Div.	Year	Cash Div.	Stock Div.
1909	9%	12½%	1915	10%	10%
1910	9½%	10%	1916	10%	10%
1911	10%	10%	1917	10%	10%
1912	10%	10%	1918	10%	10%
1913	10%	10%	1919	10%	10%
1914	10%	10%			

While the shares of the company were mounting higher and higher under this system of cash and stock disbursements, they were eagerly bought by investors at top prices. Unfortunately, the stock thus given away was being more than doubled in its outstanding amount, and it became more and more difficult to maintain the ten per cent cash dividends. As a result, the company sustained annual deficits in 1918, 1919 and 1920, of $1,220,151 for the first year, $1,544,584 for the second, and $1,288,409 for the third. It was inevitable that retrenchment had to set in, and beginning with 1921 the ten per cent cash and stock dividends had to be cut down to four per cent each, to the unwelcome contemplation of investors who had so eagerly bought the shares.

The United Gas Improvement Company is another large holding concern which controls and operates many companies in Pennsylvania, New York, Indiana, Georgia and other states. Its stock capital approximates $67,000.000. Its stock, which in the period from 1897 to 1902 sold as high as $175 a share, now commands a price of nearly one-third that sum.

Another large corporation which exercises the powers of a holding company over a great chain of public utility companies is the Cities Service Company. Its annual sales of artificial gas, if not lessening in quantity, at least have shown no increase over a period of years. By cubic feet, its sales of artificial gas in 1918 were six billion; 1919, six and one-half billion; 1920, seven billion and in 1922 the sales were 5,957,000,000. Its capital stocks, owned directly, or by sub-holding companies, and outstanding in the hands of the public, have risen from $164,322 000 in 1918, to $257 285,000 in 1922. These securities, however, cover ownership in a wide variety of public utility concerns besides gas companies.

The Middle West Utilities Company, conducted by a Chicago group of capitalists, is a holding company which serves a population estimated at 1,419,500 persons living in 534 communities, located in fifteen states, including Illinois, Indiana, Kentucky, Virginia, Missouri, Oklahoma, Nebraska, Michigan and Wisconsin. It supplies these communities with gas, electricity and traction facilities. Its stock capitalization aggregates $182,265.000.

The Peoples Gas Light & Coke Company, capitalized at $38,500,000 shows no very perceptible increase in the gas produced, bought and sold over the period of the last five years.

The general trend of public utility corporations is toward meeting the demands both for gas and electricity so as better to face the changing situation. A reduced number of the larger companies are serving concentrated areas of population, while finding new outlets for their by-products

What World Owes American Naval Inventors

Review of Developments Discloses Ingenuity of Yankee Experimenters

By WALTER B. NORRIS

ASSOCIATE PROFESSOR OF ENGLISH, UNITED STATES NAVAL ACADEMY

LORD Fisher, perhaps the most interesting character the British navy has produced in recent years, remarks in his "Memories" that formerly the wind determined the course of a naval engagement but that now all such matters are in the power of the "mind of man." The chief exhibition of the mind of man in naval affairs has been the work of the inventor, and here the average man realizes too little the tremendous services to all navies which the American inventor of naval devices has performed. He has, especially in the big things of naval invention, been the outstanding figure, even in spite of the too frequent conservatism of the Navy Department and the naval service.

AMERICAN NAVAL INVENTIONS

Famous "Firsts"

Steamboat, *Clermont*,
By Robert Fulton, 1807

Steam Warship,
***Demologos*,**
By Robert Fulton, 1815

Screw Warship,
***Princeton*,**
By John Ericsson, 1844

Turreted Warship,
***Monitor*,**
By John Ericsson, 1862

Electric Light on Warship, *Trenton*,
By Thomas A. Edison, 1883

Modern Submarine,
***Holland*,**
By John P. Holland, 1899

Airplane,
the Wright Brothers, 1905

Seaplane,
Glenn H. Curtiss, 1911

Torpedoplane,
Bradley A. Fiske, 1912

Electric Drive for Warship, *Jupiter*,
By W. L. R. Emmet, 1913

To Americans have been primarily due the first steamboat, the first steam warship, the first screw propeller, the first revolving turret, the first submarine, the first electrical device in the navies, the first heavier-than-air machine for land or sea, great improvements in gunnery devices and methods, and other important advances such as the first use of electricity to propel ships.

It is not too much to say that to an American was due the greatest revolution in naval warfare that modern times have witnessed. Somebody probably first used sails at sea in prehistoric times, and is entitled to the applause of all the ages, but he did no more than did Robert Fulton, the American, who in 1807 produced the first practical steam vessel. Of course, Fulton had his rivals and did not invent every part of the new type of vessel, but he has a claim there that belongs to no other man—that he first demonstrated the entire practicability of steam navigation, established a line of steamers that continues to this day, and started the great revolution in navigation and warfare that has occurred since that time.

But Fulton put the navies in his debt by far more than this. He also built the first steam war vessel, the *Demologos*, in the last part of the War of 1812 and made the American navy thus first to have such a ship. The "Voice of Democracy," as the name might be translated, was a large double-ended ferryboat with only one paddle wheel located in the center of the vessel in a well where it was protected from the enemy's fire. The sides were of wood, but four feet, ten inches thick, and pierced for thirty large guns, which with her ability to maneuver so readily in any direction whether there was a breeze or not rendered her the most formidable war machine of her time. She made such an impression upon the British that it was reported in England that she had sides thirteen feet thick and a device by which 300 cutlasses were brandished along her gunwales to repel boarders.

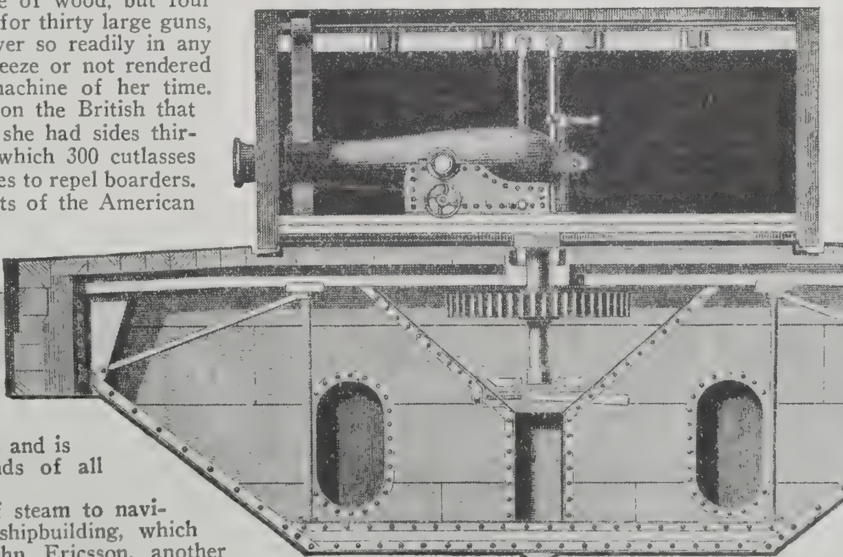
If we add to these achievements of the American inventor the floating mine and the submarine he devised during the Napoleonic wars, the latter of which only failed of success because no means of propulsion under water except hand power was possible, we can well claim that Fulton stands at the head of American naval inventors and is one of the great inventive minds of all countries and all ages.

Except for this application of steam to navigation and the use of iron in shipbuilding, which originated in Great Britain, John Ericsson, another American, can be justly hailed as the creator of the modern dreadnought. In the *U. S. S. Princeton*, commissioned in 1844, he first used the screw propeller in a war vessel, and he was followed almost immediately by the navies of Great Britain and France, both of whom came to him for designs.

Ericsson's second great claim to fame as an inventor of naval devices was the revolving turret, so well known from its use on the *Monitor*. There were many other features about the *Monitor* which entitled Ericsson to fame but they had been more or less foreshadowed or have been superseded in later years. But the revolving turret remains as one of the cardinal features of modern battleships. In 1862, when the *Monitor* became famous for her encounter with the *Merrimac*, the British navy, and the French, already possessed iron-clad vessels, but the *Monitor* type was so revolutionary that the London *Times* remarked, "Whereas we had available for immediate purposes 149 first-class warships, we have now only two . . . . There is not a ship in the British Navy, apart from these two, that it would not be madness to trust to in an engagement with that little *Monitor*." Concentration of fire, perhaps the chief maxim of gunnery today, and armor protection for the guns, are both products of the revolving turret Ericsson introduced into naval warfare. Even the idea of the ship, all of whose guns are big guns, is definitely worked out in Ericsson's masterpiece.

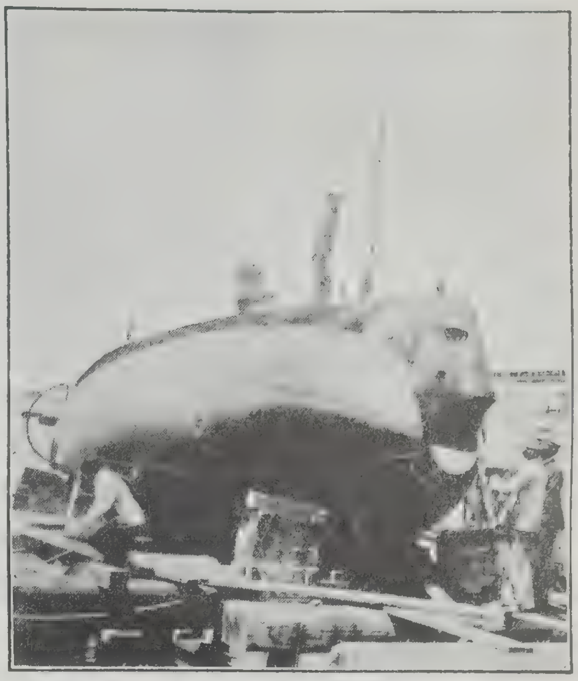
While Americans have invented thousands of little improvements in naval construction and engineering, they have, it would seem, distinguished themselves for daring and for revolutionary changes. The refinements of these ideas they have often left to other nations. Thus before 1880 they allowed the British to make most of the advances in ship construction such as the various changes in boilers, the use of double bottoms, the specializing of warships into types such as the cruiser, the torpedo boat, and the destroyer. America's contribution during this time, and it did not really appear till nearly the end of the century, was the perfection of a submarine vessel and the introduction of electricity to many of the devices of naval fighting. In the eighties America was content to buy some of the plans for new warships from British designers, but she was stepping ahead in other directions with surprising daring.

There seem always to have been submarines, if one consults the histories of the subject, beginning at least as far back as Jonah's whale and including such vessels as the Confederate "Davids," which were noted for being addicted to submerging permanently. But there is no question that the present submarine owes more to two Americans, the Irish-born John P. Holland, and the native American, Simon Lake, than to any other dozen men. The submarine had to wait for several things to be developed. One was the automobile torpedo, the only weapon a submarine could use to advantage. Another was the internal combustion engine for surface propulsion. And a third was some system of driving the engines by electricity while the vessel was totally submerged. With these in hand, and the diving mechanism by means of rudders which Holland invented himself, a practical submarine was produced. Holland's claim to fame is therefore like Fulton's, for neither originated all the devices or ideas used but each first put these together in a vessel that would actually do the work assigned it.



The first revolving turret. Diagram showing arrangement of turret and armor of Ericsson's *Monitor*.

Like Ericsson, Holland was an American by adoption. Ericsson, a Swede by birth, invented the *Monitor* type of vessel in 1854 when Sweden's hereditary foe, Russia, was fighting France and England, and he sent his idea to the French emperor. Holland as an Irishman hated England and wished to aid the Fenians in their guerilla warfare. His second submarine was accordingly largely paid for out of funds contributed to the Fenian cause in the United States, and the plan was for it to be transported across the Atlantic on a steamer, launched in an Irish harbor, and destroy British warships in its vicinity. These plans were never carried out, and the first real Holland submarine was the *Holland*, which was accepted by the American Government in 1899. Thus the United States became the first navy to possess a submarine that proved itself an effective weapon in fighting.



The first submarine, the *Holland*, under construction at Elizabeth, New Jersey.

In a similarly daring way the United States through its inventors tried to apply electricity to all the operations carried on aboard ship. The first electric light plant at sea in a warship was in the *U. S. S. Trenton* in 1883. Then came electric ammunition hoists, electric gun training mechanisms, electric steering devices, telescopes, electric turret-turning machinery, electric range indicators, and hosts of others, with the chief one of recent years the use of electricity as the motive power—usually called the electric drive. In this the United States has still a unique place, as it has not yet been adopted by other nations. But there is little doubt that such installations will spread and the courage of American naval designers be vindicated.

In all the inventions of the last thirty years of the American navy perhaps the name of Rear Admiral Bradley A. Fiske is most prominent. One of the earliest officers to appreciate the fact that electricity was going to supersede other power on the naval vessel and that electrical devices offered many possible improvements in the training and firing of guns, he continued year after year to invent and patent electric machinery. It would seem that not all of his ideas were adopted, but they led to many improvements and deserve to be remembered in the history of naval invention. Especially in naval gunnery was he active, and his claim that he had as much to do as any man with the advance in accuracy of fire and increased speed is hard to dispute. Part of this was due to his experiments with telescopic sights, which were actually in use on American guns before they were generally adopted by other navies. It was probably the telescopic sights installed on the Japanese ships at Tsushima in 1905 that accounted for their effective fire upon the Russians. Though Sir Percy Scott of the British navy was also a pioneer in these matters and had the official position later to carry them out, as Admiral Fiske did not, it is clear that not all the credit given him for the improved methods of firing and training gun crews and for inventing the system of "director" fire is justified.

For the invention of the torpedoplane Admiral Fiske is also noteworthy. Though not used by our own navy during the World War, it was tried successfully by the British and has since then become a definite branch of naval aviation.

Lastly, America has good ground for credit for the invention of the airplane itself and of the seaplane; its naval sister. Whether the credit for the first heavier-than-air machine should go to Professor Langley, of the Smithsonian Institution, or to the Wright Brothers, in either case it goes to an American. And when Glenn H. Curtiss, in 1911, another American, produced the first airplane for naval uses America again took the lead.

It is also not fair to omit mention of the fact that it was a U. S. Navy flying boat, the NC-4, which was the first heavier-than-air machine to cross the Atlantic.

No preparation for war is less expensive than inventive genius, and the nation that can by sheer wit and ingenuity defend herself will not easily be overcome or lightly attacked by foreign powers. Today the United States should not neglect to encourage her men of originality in engineering and science to surpass the achievements of Fulton, Ericsson, Holland, Fiske and the rest in making the "mind of man" in America win new victories in the future.

Hodge's 'For All of Us' Proves Clean Plays Pay

But the Audiences That Go to View His Work Are Not the Typical Manhattan Theatergoers; They're Plain, Wholesome Home Folk

By PETER SCHUYLER

WILLIAM HODGE

THEATRICAL FAME is a queer thing. One of its many perquisites is being "interviewed." A star actor appearing in a great stage success may be of such limited intelligence that he needs a valet to guide him through the traffic to insure his delivery at the stage door for the performance. He may not have (and frequently has not) an idea in his cranium. He may be a social boor, a mental cipher, a nauseating egoist. That is unimportant. He is the star of a success. That is sufficient. He will be "interviewed" in bed and out of it, entering the bath and leaving it. His lightest word, whether it relates to the exact degree of solidity which he requires in his poached eggs or to the elements of economic justice in the Mellon tax reduction plan, becomes a matter of international moment. He is pursued day and night by someone who wants to get something out of him for their own profit. If he is a sensible man, with no illusions about the immortality of theatrical fame, he will take every decent precaution to keep from being run to death, like a stag pursued by hounds. If he is a self-sufficient ass he will wallow and wax fat upon the attention he is attracting.

Not Easy to Interview

ON THE other hand he may be one of the brightest ornaments of the theatrical heavens; he may be a brilliant and engaging conversationalist; a clever wit; a deep philosopher, and a profound thinker on all subjects from the theory of relativity to the effect of pumpkin pie upon the New England character. He may have something genuinely important to say, something actually worth hearing. But that does not make the slightest difference. He is appearing in a stage fiasco. That is the only thing which matters to the newspaper-fed multitude, or the editorial bosses who decide what goes on the journalistic bill of fare every day. Failure, as such, has no "news value" no matter how tragic may be the circumstances surrounding it. It is when the play is a failure that the star fully realizes what Tom Moore meant when he wrote,

"As one who treads alone
Some banquet hall deserted."

It is, therefore, only a man of balance who can win and appreciate, at its proper value, stage success. Only a man with his head screwed firmly on his shoulders can withstand the temptation which that success offers to talk foolishly and be sure of seeing his foolishness exposed to the world. Few theatrical celebrities realize the commercial value of reticence.

One of the reasons for the phenomenal appeal which Maud Adams had for the playgoing public was the fact that there was a wall of insurmountable privacy thrown about her off the stage. Miss Adams was one of the few stars whose diet, habits, and intimate details of costume were never the subjects of newspaper and magazine gossip. The result was that she became a woman of mystery who created a feeling of curiosity about herself which increased with the years. This feeling, to the very finish of her career as an actress, remained to the world an insatiable and unappeased desire.

William Hodge, the author and star of "For All of Us," which is one of the outstanding financial successes of the present New York season, is not an easy person to interview. Not that he is inaccessible. He does not draw about himself a mantle of isolation and defy the universe to take it off him. He is a very human being, kindly, courteous, and approachable. However reluctant he may be to offer himself as a sacrifice to interviewers is obviously not based upon any cynical determination to make of himself a figure of mystery in order to create a paying public. He is not that sort. Nor is he bent upon lifting himself to the realm of unapproachable platform deities into whose presence only the initiated may penetrate.

A long and varied experience as an actor has probably filled him with a horror of stage-door pests of which the human question mark is not the least. The sight of his name in the newspapers has ceased to be a novelty to him and the thrill incidental to it has vanished. In addition to that he is a busy man who is paying one of the prices for success, which is being made an object of attentions by all sorts of people. To quote one of the stage employes of the Ambassador Theater where he is appearing, "He's pestered to death by a lot of guys that come around to tell him they knew him twenty years ago and ask him if he don't remember them."

Twenty-seven Weeks in Chicago

NEITHER is Mr. Hodge an easy celebrity to get copy out of. He displays no conceit. He apparently does not consider himself either an oracle or a prophet. He answers questions quickly, quietly, and to the point. At least he did on the Saturday afternoon when the following conversation took place. Matinee day is not the best time in the world to talk to any actor. He is played out from the performance he has given and not exhilarated at the thought of the one which he has to give after supper. It takes the star of "For All of Us" forty-five minutes to change himself facially from William Hodge, actor and author, to Tom Griswald, foreman of a gang of ditch diggers. It requires about the same amount of time to change back from Tom Griswald, foreman of a gang of ditch diggers to William Hodge, a busy man with an important appointment a few minutes away. Time to him means something of importance so that beneath all his quite simple courtesy was the evident feeling that what he had to say could be said briefly and clearly and that someone besides the present interviewer was waiting who must also be met and talked to.

"How has your play been received outside of New York?" was the first question.

"It ran twenty-seven weeks in Chicago. That speaks for itself, does it not?" was the answer.

"And other places?" pursued the question mark.

"Have you seen the show?" asked Mr. Hodge.

"I expect to see it tonight," was explained. "But I heard the laughter and the applause while I was waiting downstairs to see you."

"It has been the same everywhere," said the actor. "People all over the country where I have played have received the play very graciously."

Just a Clean, Wholesome Play

SUCH and so unusual modesty stopped that avenue of questioning effectively. Perhaps Mr. Hodge had a mission to perform! Frequently stars of pronounced successes have or imagine they have, an apostolic or an evangelistic message to deliver. If they are under that impression they are not bashful in shouting the fact from the housetops.

"When you wrote 'For All of Us' did you have in mind the intention of doing something to counteract the filth of the New York stage?" interrogated the interviewer. If Mr. Hodge had any delusions of greatness this was the time to exhibit them! He remained perfectly normal under the suggestion.

"No, I didn't think about that at all," he answered with a little smile. "I merely tried to write a clean, wholesome play that I would be proud of if it was a success and not ashamed of if it was a failure."

Taking that statement as a basis of reasoning, Mr. Hodge's bosom must swell with pride every time he gets his box office statement, since from all available sources of information comes the news that "For All of Us" is "a big hit." On one point at least New York and Chicago are in complete accord. Both like the play.

"It's easy enough to write an evening's entertainment of dirt," confessed the author, "but our people are willing to give a man credit for the hard work it takes to do something where the laugh follows the clean tear. Naturally I can't boost my own play," he continued with a suspicion of a laugh. "But when you ask me if it appeals especially and particularly to one kind of Americans I can only answer that by referring you to the comments of those of different races who have seen it."

There was a list of other questions which were to follow, What type of folk came to see "For All of Us"? What significance had his success with that particular kind of play? Did he think it could have any effect on the rotten New York theatrical situation?

But there was a warning gleam in the Negro valet's eye which said plainer than words, "Are you going to turn out to be One of Those Things after you are lucky enough to get in here? Didn't my boss tell you he had only a few minutes to keep an appointment?" Mr. Hodge, from his attitude, was convinced that he had said all he had to say on the subject.

A visit to the play that night could answer the inquiries. It required no photographic proof to show that the audience which saw the play on that occasion was not made up of the typical Manhattan showgoer. Plainly it was composed of what is generically described as "The Man of the Street." That is only another way of designating a great mass of people who have grown sick of paying good money to see bad shows and who, as a result, stay away from the theater altogether until something comes along which they are sure will be worth the price. There was no evidence of the so-called "smart" audience. The hardened, sophisticated showgoer was conspicuous by his—and her—absence. There was no parade of overpainted, underdressed women in evening dress marching down the aisles chattering in the middle of the first act. The Tired Business Man failed to show in noticeable numbers. The people who were present looked like plain, everyday persons who came to be entertained, not to be excited, exhilarated, or virtuously shocked by dirt. Naturally the wiseacres of The Great Shine Way were absent. There are no "hot stuff" situations, no naked women, no double-meaning "cracks" to draw them. Even more naturally the "intellectuals" whose special god is Bernard Shaw and whose pantheon is composed of the "advanced" Continental dramatists were conspicuous by their nonattendance. For them and others the story of "For All of Us" could be only a stirrer of ribald mirth.

Highbrows Would Find Fault

A BANKER, Frederic Warren, has ruined his stenographer. When he falls sick of paralysis he brings the girl into his home as his nurse. She is conscious all the time of the wrongness of her position but is caught in the trap of circumstances, and unable to escape. The banker's wife realizes the situation but tolerates it in the hope that somehow it will be straightened out and the participants in it made to see the evil involved. The means whereby the desired effect is accomplished is the person of a foreman of the gang of excavators working in front of the Warren mansion who has turned himself from a convict into an unprofessional healer of men's hearts and bodies by a study of the Bible which Mrs. Warren, years before, had slipped through the bars of his prison cell while doing her welfare work.

Certainly these plot elements would drive into ecstacies of merriment mental highbrows to whom the theme is suggestive of the Sunday school prize and the intellectual diversions of the mentally deficient. The students of dramatic technique would find fault with Mr. Hodge's handling of the tools of the stage craftsman. They would declare that the other characters in the play are used as instruments to pull speeches out of Mr. Hodge which are so long that they amount to monologues. They would assert that Mr. Hodge violates all laws of stagecraft in getting three or four characters on the stage and letting them stand like statues while two other characters are speaking to each other. Critics of acting would grow inarticulate with rage as they described Mr. Hodge's playing of the scene where the reformed convict discovers that the girl in the banker's life is his own long-lost daughter. Cynics would chortle with glee as they called attention to the situation of seducing plutocrat, the ruined girl, and the final climax in which the banker relinquishes his innocent victim so that his son can marry her. Analysts would pick flaws by the thousand in much of Tom Griswald's theology and philosophy. They would isolate with meticulous care the instances of inconsistency in the character drawing, the needless repetitions, and the constant use of unwarranted coincidence.

Not Drama, a Lecture

IN THE faultfindings of all of these groups there is some measure of truth and some foundation in fact. Considered as a play, "For All of Us" is not drama at all. It is a lecture on mental and spiritual healing, given by an unusual character which speaks in language intelligible to everybody and with occasional dashes of slang which are as shrewd and up-to-the-minute as anything one could hear at Forty-second street and Broadway. The cast is not noticeably good. In one or two instances it is altogether bad. The interest depends entirely on such entrance and exit of Mr. Hodge. It is not well directed, it has no strong clash of character, no big dramatic situation, and it is palpably written by a man who knows every surefire theatrical and stage trick. What then is the reason of its success? It is drawing capacity houses! It is exerting an influence—even though it may be confined to their immediate presence in the theater—on the minds of the people who see it! Listening to their comments as they leave the theater proves that!

Mr. Hodge has a large personal following. He represents something native to thousands of people. He is the nearest approach to what they believe the real American is, that we have on the stage in this country. But he is no more that now than he has been for some years. Yet none of the plays in which he has appeared, since "The Man From Home," has had the success of the present vehicle. His other appearances in

(*Concluded on page 15*)

Mr. Ford's Page

THRICE in five years the American people have been silenced by the passing of a President. Theodore Roosevelt died early in 1919. Warren G. Harding died in the summer of 1923. Woodrow Wilson has just passed in these early days of 1924. In the judgment of mankind Woodrow Wilson will doubtless rank with our greatest Presidents and if the work he began should sometime find its successful consummation, he may yet be given the third place next to Washington and Lincoln. This condition of immortality is insisted on by our people, that the man actually accomplish something. This Washington did; this Lincoln did; if Wilson's work is strong enough to live and establish itself in the life of the world as their's did, he will certainly be entered in the confraternity of the greatest Americans.

Born of the old stock which made America what it is, and which will keep it what it should be, Mr. Wilson was an energetic force in whatever work he touched. Once he saw his path, obstacles but increased his power to grapple with them. The tasks he chose were not the easier ones, and perhaps there lay in the back of his mind a hope that the time would come when his tasks and his powers would be equal, and the necessity for struggle be past. But that time never came. Wherever he went, to whatever task he put his hand, he found always more difficulty and antagonism.

This fact must be borne in mind when estimate is being made of his personality. It will be said in some quarters that his methods aroused antagonism; it may be said with equal probability that his methods were the result of the antagonism he encountered. An idealist comes into a situation and sees at once the need of improvement; he thinks that nothing further should be necessary than the proposal of the ideal, he believes in its self-certifying power. But he soon learns that this world—the ruling part of it, at least—subsists on imperfection and hates nothing worse than progress. Chaos and wrong are too profitable in some quarters, too pleasurable to some natures, to be readily surrendered for order and righteousness. The awakening of the idealist to the terrible realism of evil is one of the tragedies of life.

As university president Mr. Wilson endeavored to establish his idea that an educational institution existed for the intellectual development and discipline of its membership—a perfectly safe position, one would say—but it made the presidency of Princeton rather unsafe for Mr. Wilson. The rich loiterers and their friends fought him strongly. He believed in democracy with sufficient faith to attempt its introduction into college. It was in the midst of this fight, which, complicated by the conditional gift of millions to the college, was already beginning to go against him, that an exit opened up for him in the form of an opportunity to enter politics. He took the opportunity and became Governor of New Jersey. The Presidency came to him in swift course.

EVERY man comes into life in time to do his own work. Thus Woodrow Wilson came. What was his greatest work, Time's verdict alone will determine. Two actions of his ought never to be omitted from the list of his greater deeds. One was his inflexible attitude on the Mexican question, his policy of "watchful waiting" which was so abundantly justified by after events. Enemies desired us to become embroiled with Mexico, to tie our hands in the war they knew was coming. Again, in his position on the matter of special privileges in Panama Canal tolls, Mr. Wilson kept his country's treaty-word from becoming a mere "scrap of paper" and enhanced our moral prestige in the world at a time when moral power was the strongest power to wield. Two simple acts of wisdom and justice, but their effect can never be measured.

Mr. Wilson's connection with the Great War has overshadowed certain other matters which marked his earlier months as President, and certain other matters which, but for the war, would have engaged him. There is little doubt that he saw the encroachment of money power in this country. He saw it in its aspect as the destroyer of free opportunity. He saw it in its potentiality for blotting out of our common life all that had been distinctively American. He saw the money pressure making men more like cowards than their forbears had ever been. It must ever remain a speculation what further course he would have taken had he been left free to pursue his intentions. He thought he was aiming a strong blow at the unjust control of credit when he established the Federal Reserve System; the intention of that system, as it lay in the mind of its sponsors, was always more beneficial than has appeared in practice. But there is no doubt that Mr. Wilson intended it to be his entering act in the war against money domination.

He saw, as so many have seen, that the internal battle has been between Industry and Finance, between creators and brokers, and with the utmost deliberation and firmness he arrayed his powers on the side of Industry and the creative forces of the country.

But while he was thus endeavoring to curb the unfair practices of the money power at home, the International Financiers had thrown the world into giant confusion. It was a time when the feeling of the necessity for reform was strong upon the minds of the forward-looking men of all lands. Idealism was awake; men were aroused to the values of creative work; in every direction there were signs which threatened the further rule of brokerage in the affairs of men. And as if to crush the new spirit once for all, the war was let loose. Wilson's plans, like those of thousands of other leaders, were rudely thrust aside, never to be resumed.

In the meantime, however, whether conscious of the near advent of war, or merely in obedience to his sense of justice, Mr. Wilson took two steps which had an incalculable bearing on the prestige and security of this country during all the troubled time that followed.

First, when forces inimical to the United States sought to embroil us in war with Mexico, Wilson adopted his much-ridiculed but afterward justified policy of "watchful waiting." Who could have foreseen that several years later the very papers should be found which proved that part of the "diplomacy" of International Finance was that the United States should be put definitely out of European affairs by being kept busy with Mexican trouble? Mr. Wilson's policy was the only thing that left us free to save the world, and kept us free from joining the list of strong predatory nations whose victims are the small and weak.

Then there was his policy on the Panama Canal. In this friend and foe alike opposed him, and those who hated Britain accused him. We had entered a treaty with Great Britain regarding the Panama Canal. An act had passed Congress giving a shrewd Yankee interpretation to the treaty, a sort of horse-trader's interpretation, that American ships might have a decided advantage over other ships using the Canal. The act was felt to be a tricky disavowal of some phases of the treaty. Woodrow Wilson asked Congress to repeal the Act in which the interpretation was contained. It was a daring thing to do, though greater service is yet to be done by someone with courage enough to ask the repeal of every privilege-supporting statute on the books.

"Whatever may be our own differences of opinion regarding this much-debated measure," he said to Congress, "its meaning is not debated outside the United States. Everywhere else the language of the treaty is given but one interpretation . . . .We are too big, too powerful, too self-respecting a nation to interpret with too strained or too refined a reading of words, our own promises just because we have power enough to give us leave to read them as we please."

Who could foresee that in little more than a year from that time, the world would be in flames and a great empire already judged and condemned because of "a scrap of paper"? Who could foresee that our own great influence on the belligerents would hinge on just such facts as being big enough and powerful enough and honest enough to repudiate national advantages taken at a slight cost of our rectitude? Did Wilson see? Or was he guided at the moment by his own sense of justice, which providentially came to mean so much in the strain of War?

These are two of what men call the lesser services which Woodrow Wilson rendered. It is well to remember the little things: they often have great consequences.

Woodrow Wilson: 1856—1924

THE most momentous national event since the entrance of this Nation into the Great War is the death of Woodrow Wilson. His personality attained such dominance over American thought, the gigantic events of war had exalted him for a time to so high a pinnacle of world representation, that of him more than any other American it may be said he was the chief figure of the War, and with him closes one of the major pages of its history. Never popular in the usual political sense, he yet commanded public confidence. Aloof from the political trivialities of his office, he was nevertheless the only man besides Lincoln who could put into words the people's mind and heart. A scholar and a historian, he became the administrator of the heaviest material task ever loaded on this Government. In the end he gave the world a new objective, nothing less than the ideal of a League into which all menaces of war should flow and be dissolved by reason. For a few months, during which the spiritual hopes of humanity burned with an intensity and purity never known before, he was hailed as humanity's savior; around him centered the pathetic, the prophetic hope that at last a man had come who could right the wrongs of earth. How he failed by being afraid to fail, how he fell a broken figure while trying to retrieve his failure, is recent history. To state many of the facts is almost to imply a judgment, and it is evident from the bitter hate which Mr. Wilson aroused, both in his party and out of it, and the intense love and confidence he aroused both in his party and out of it, that we are too close to him even to approximate the judgment upon his work which History will render.

He had been fighting death for four years. He was as definitely removed from the forum of public life as if a hand had done it. His double affliction, inability to bring his powers actively to bear on his dearest project, inability even to live the normal life of a worn-out worker—what this double affliction must have meant to him, few can realize. But in this discipline also he showed himself a brave man. Much dissension caused by him will die with him. He is one of those rare figures who command national respect even from those who differed with him. And this because of his elements of true greatness.

The Mellon Proposal

THE Mellon tax plan, whatever its good points may be, is suffering from the zeal of its friends. For a time the public was being given the impression of propaganda, where it should have been given facts. The Democrats put out a set of figures showing the effect on the income tax of a married person without dependents under their bill as compared with the Mellon bill, while the Republicans put out figures showing the effect of the bill on the income tax of a single person and of a married person with two dependents. The result is four sets of figures, all from partisan sources. If the Government could issue an official set of figures, the confusion would be less and the public confidence greater. Against this suggestion it may be contended, however, that the Mellon statement *is* the Government's set of figures.

One bad effect of the propaganda is that the public has been induced to emphasize tax reduction above tax production. No Secretary of the Treasury is so eager for tax reduction that he exhausts or only partially supplies the Treasury. In any attempt at tax reduction he must continue to see that the collected taxes are sufficient to supply the needs of the Government. So that all contentions that Mr. Mellon could have recommended still greater reductions may be true, but they must be measured by an inquiry as to whether further reductions would have destroyed the sustenance of Government. It is not primarily a political problem with which a Secretary of the Treasury has to deal, but a fiscal problem. And the greatest danger to sound legislation and public understanding thereof is incurred when the fiscal act is taken at a time of, or with a view to, political advantage.

On the other hand, Democrats who oppose the alleged Republican plan to reap political advantage out of tax reduction are seeking to minimize the Secretary's proposals by describing them as more favorable to taxpayers of large incomes than to those of small incomes. The same gross revenue, say Democrats, could be raised with greater reductions in taxes on small incomes, and smaller reductions on the large incomes. This is doubtless the right way in which to strike a popular chord, all things being equal. But as the choice is not between two plans as yet, the only plan of which the public is officially aware being the Mellon plan, the question before the public at the present writing is whether the people want the reductions offered by that plan or none at all. Certainly, with the issue thus limited, the people will approve the Mellon plan. The *Literary Digest's* test vote is entirely whether to take the Mellon plan or leave it. No choice is offered between that plan and one which may offer more.

The Mellon plan does simply this: without changing the character or amounts of the exemptions of the ordinary taxpayer, it reduces the normal tax of eight per cent to six per cent on the net income after exemptions are allowed for, except that on the first $4,000 the rate shall be three per cent. That is, the income tax rate is three per cent on the first taxable $4,000, instead of four per cent as under the present law.

Surtaxes which now begin at one per cent on taxable amounts from $5,000 to $6,000, and extend to fifty per cent on sums of $200,000 and upward, are readjusted. The proposed figures run from one per cent on net incomes of $10,000 to $12,000, to twenty-five per cent on sums of $100,000 and upward. The tax stops at twenty-five per cent, which is practically a fifty per cent reduction all down the line to $10,000.

Corporation and other taxes are unchanged. Telephone, telegraph and admission taxes are revoked.

The charge that larger incomes are more relieved than smaller ones is true on the face of it. There must be some reason for this, but the reason is not given. The Treasury Department, no more than any other department of the Government, takes the people into complete confidence. It can only be surmised that the Government does not depend so much upon smaller incomes for its support as upon larger incomes, because (this is a supposition not altogether unwarranted by facts) taxes on large incomes are more certain to be paid than on small incomes. The Treasury Department has made no report on the extent of the repudiation of income tax payments by persons of small income. So that figures based on the supposed payment of smaller taxes may be only figures and not sound bases for computation of what actual reductions of the tax would bring in real money. Grouping the taxes according to the financial status of the citizens is not a final method until all the facts within the groupings are known.

Mr. Mellon himself says that large taxation of large wealth has a tendency to decrease the source of taxes by reducing the initiative of the taxed persons. The argument is interesting but has not been generally convincing. It is like the argument that these reductions will lower the cost of living: an illogical contention, since all that goes to make the cost of living high is put into that cost before there is a surplus to tax. The evident hope of the Treasury is that wealth now concealed in tax-exempt securities and consequently non-contributory to government upkeep, will be withdrawn and put into productive channels.

The matter comes to this: the Mellon plan offers a reduction. A reduction in the hand is worth two partisan arguments in Congress. The proposal to make the reduction retroactive, so as to cover 1923 taxes, will prove popular. Whether Mr. Mellon has made the greatest reduction possible, is a question for decision in Congress. If those who charge him with political motives are correct, then it must be that he *has* made the greatest reduction possible, since, if the charge is correct, votes must be his motive, and the voting majority is formed by persons of small incomes.

Teapot and Partisan Brew

PARTISAN spirit is beginning to taint the good work of the Teapot Dome investigation, and President Coolidge is being blamed for not playing politics or behaving like a swashbuckler. Mr. Coolidge, as Vice-President and presiding officer of the Senate, was cognizant of the Teapot Dome matter months ago. However delicate he may have felt about bringing it up in President Harding's time, it is being said in some quarters that he might have brought it up since he himself has become President. Upon this it is attempted to make a smudge—one of those side-plays in the political game upon which major emphasis is not laid because of their weakness.

It should be remembered that until recently the question of Teapot Dome was largely a geological matter, depending entirely on whether the oil deposits there were safely walled in, or were subject to drainage through other wells drilled outside the Government's property. That matter is not yet settled, there being three expert reports upon it. The action of leasing naval oil reserves to private concerns, in any case, was reprehensible, but there was the executive order of President Harding without which it could hardly have been done. At least, during the months that Mr. Coolidge presided over the Senate there was nothing but matters of this order involved; and after he became President the same matters formed the substance of inquiry, until the amazing disclosures of wholesale personal corruption were made. Thereupon the President promptly acted. He could not have acted earlier upon a matter in which even the committee in charge had not discovered a basis for action.

The complaint now made is that he fails to act drastically enough. If the President were playing politics, innocent and guilty heads alike would be falling into the basket. Outcry has been made for the head of the Secretary of the Navy. He is at least one man whom the suspicion of personal dishonor has not touched. Is a President to blast a man's reputation without sufficient reason, to satisfy a partisan cry for revenge? Every American citizen, even one believed to be guilty beyond doubt, is entitled to his day in court. Even Mr. Fall is entitled to that. Our system grants him that. If Fall were in the Cabinet, doubtless the President would not have lost an hour in removing him. But Fall left the Cabinet as soon as he had performed his valuable services to his friends, Sinclair and Doheny. Is President Coolidge to seek another scapegoat to satisfy the cry for official blood? If he does, he is less the calm, just mind which he has been judged to be.

The President has lost no time. The men involved cannot escape trial of all their actions. The President has taken that matter immediately in hand. Besides, he at once set in motion the necessary processes to quash the leases. He is acting with the dignity and justice and certitude of movement which becomes the Chief Magistrate. He will not play politics to help his own nor to hurt his opponents' party.

The thanks of the nation is due to those Democratic Senators who pursued the clues and facts in this case to such momentous results. That thanks is not partisan. These men have performed a public service which must redound to their personal honor and cannot but reflect glory on their party. They will seriously tarnish their work if they subvert it to partisan ends. President Coolidge appreciates their work and will lend all his power to further rather than hinder it. If cleaning up its own corruption is to be held against the Republican party, then it is a safe wager that the President is willing that it should so be held, for himself he will go on cleaning up.

Because "gasoline and liquor will not mix," the automobile has become the greatest prohibition argument in the country. Even with all the complaint against the non-enforcement of the prohibition law, it is everywhere admitted that conditions are immeasurably better than they would be if the saloon were back in its former numbers.

Mr. Gregory did not know he was working for Doheny until he read it in the papers. This is entirely believable, considering the ramifications of business today. But does Mr. Doheny know for whom he is working? Does any one believe that the men who were securing naval leases were working for themselves alone, and were financed by themselves? If the investigation goes far enough to uncover the big International Financiers who are still in the background, it will be worth a hundred times more to the country than even the catching of Fall et al.

A Modern University in a Medieval Stronghold

Durham Castle, One-time Impregnable Defense, Now Houses College

By PAUL TYNER

TO THIS day in England, only a town that is a Bishop's See may, legally speaking, lay claim to the proud title of City. Striking reminders of the union of spiritual and temporal powers in a medieval bishopric is found in the juxtaposition of Durham Cathedral and Durham Castle. The fortifications were built for the protection and defense of the cathedral, and only incidentally of the town, which is a mere appanage of the castle and grown up around it. As noted in my article on Durham Cathedral (The Dearborn Independent, November 3, 1923), it was because of fear of the Danish invaders that the congregation of St. Cuthbert fled from Lindisfarne. Fear of the Norman a little later led to their seeking greater security for the saint's shrine at Durham, or "Dunholme," as it was then called.

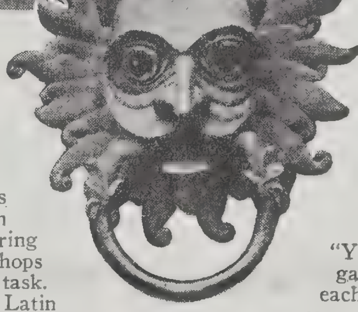
The plateau on which the monks settled was defended chiefly by its strong natural position; the river, and the steep escarpment rising from it, precluding attack on all sides but the north. One of the first steps taken by the monks was to fortify the place, walling the city round about, throwing up earthworks along the edge of the escarpment and on this rearing a stout wooden palisade; a great mound closing the side unprotected by the river's windings.

Durham Castle, as we see it today, dates in large part from the time of the Norman Conquest. It is known that the Conqueror was a great builder of castles. His chief object, having conquered, was to secure his conquests, and his first care, on gaining possession of a city or town, was to regard it from a military point of view, and to order the construction of such fortifications as would enable him to hold it. In the case of Durham, the wisdom of this policy was emphasized by an early experience in William's conquest. But Durham was a famous stronghold half a century before William ascended the English throne. In the year 1006, the place was unsuccessfully besieged by King Malcolm of Scotland, who had a narrow escape after his army had been routed by the Northumbrians. On the occasion of a second Scottish invasion, headed by King Duncan in 1038, Durham was again besieged and sustained repeated assaults. Finally, the bishop's men made a sally and defeated the Scots with great slaughter. They celebrated their victory by exposing the heads of the slain leaders on poles in the market place and on the walls.

The men of Northumberland were uneasy under the Norman yoke and prepared, with the assistance of Sweyn, King of Denmark, to resist the Conqueror's authority. So in 1066 they strengthened the fortifications of Durham and made frequent sallies on the invaders. William marched in person against the rebels, who, being disappointed in the expected Danish aid, were obliged to seek safety in flight, leaving the castle open to the Conqueror. Three years later, Robert Cummin, who had been made Earl of Northumberland, was sent by William to Durham to enforce his authority. So exasperated were the inhabitants by the atrocious conduct of the Earl's soldiers that they broke into the city, set fire to the bishop's palace, in which Cummin had taken refuge and massacred that commander and his 700 soldiers, only one escaping.

To revenge this massacre, William marched northward with a powerful army and laid waste all the country between York and Durham with fire and sword. The devastation thus perpetrated forms one of the saddest pages in English history. We are told that "Between York and Durham, he did not leave a house standing, reducing the whole district to a horrible desert, smoking with blood and in ashes."

On William's approach, the monks fled, carrying St. Cuthbert's body to Holy Island, a four days' journey.



Above—This is Durham Castle from the River Wear, which flows in a horseshoe bend around the Cathedral. Left—The carved black oak stairway in Durham Castle, now used as Durham University. Below—The Sanctuary Knocker on the north door of Durham Cathedral. The Cathedral in ancient times was vested with the right of sanctuary. This right might be claimed by any criminal fleeing from the law or his enemies. Once he succeeded in laying his hand on the knocker he might remain safely in the Cathedral for 37 days.

After plundering the Cathedral of its gold, silver and precious stones, the Normans departed. As related in the previous article, the monks brought back the Saint's body when peace was restored. It was probably on the occasion of William's second visit in 1072 that he projected the erection of the great turreted and bastioned stone fortress that forms the present castle.

The construction of this Norman Castle, later famed as the strongest in Europe, was pushed vigorously. An annual payment was granted out of the revenue of the Abbey Church of Waltham toward the cost of the works during three several episcopates, and the Norman bishops threw themselves with much energy into the task.

Let me quote from the translation of a Latin description of Durham and its fortifications written about the middle of the twelfth century by a poetic monk, Laurence, afterward Prior of the Convent of Durham.

"The land rises in steeps, and its feet are rocky and its sides rugged.

"On every side, its steep and precipitous appearance warns off the enemy; it also despises hostile hands because of the swift river which goes around it in the shape of a horseshoe; the watery valley girds the lofty place.

"Yet, nevertheless, that place, that steep place, is not an island; here a hill divides the horns of the river.

"And because it is as to its approach extremely rough, and as the ascent to it is also a different place, an enemy can do nothing there.

"The plateau makes smooth the extensive heights of the strong place; the place has a level surface.

"A hill, however, rises above the plain on the north, the high mound at its apex.

"Lo, here you have the ways in which nature fortifies the place.

"And whereas the strong site everywhere defends the unyielding city, yet art also with a wall defends and adorns it.

"A strong wall everywhere girds its lofty crest, a wall scarcely in need of any garrison;

"It is broad and high and strong; it is capped by lofty battlements with threatening towers at intervals.

"No one can draw near the gates by which the city is entered without difficulty.

"The gate which looks toward the southeast is planted openly and proudly on a rock.

"It bears a tower for its crown, and is with difficulty attained by a narrow ascent and by a sufficiently precipitous way from the river in the valley.

"The second gate, which the strong and frequent showery southwest wind attacks, almost equals the first.

"Nevertheless, the descent from this place is more gentle, but it leads to hazardous waters.

"The third gate, at which the wall of the city is turned aside from the east to the north, stands with its head crowned with a tower.

"This gate displays parapets more stately than the others, displays also a threatening front.

"And although it happens that the circle of rapid rolling water from that place turns aside with its round incomplete;

"Yet there is that which defends the gate in place of the river; a wall on each side, a tower above and an open space in front.

"So with its front defended and its right defended, it has also that which protects its entrance on the left.

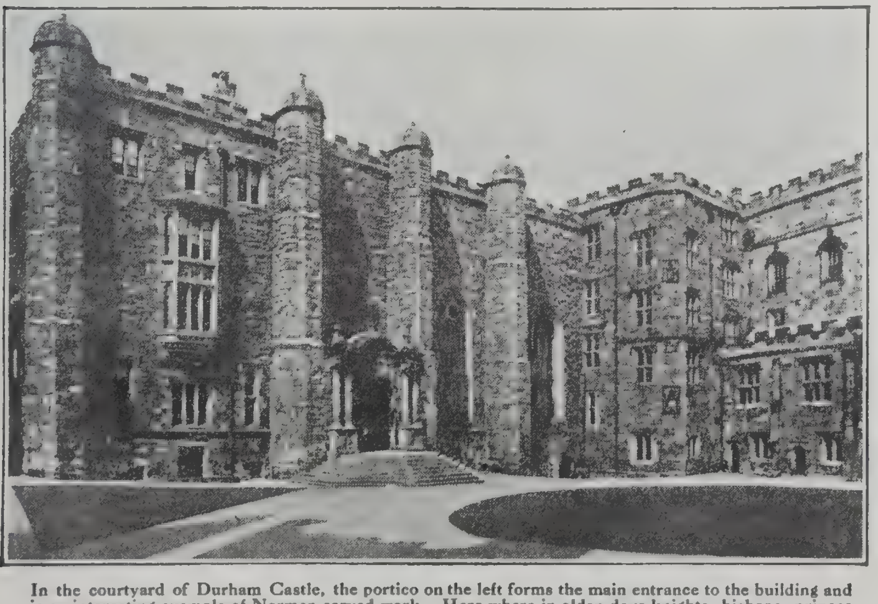
"Not far distant the mound, rising into the air, displays the plateau with its far-stretching surface."

Gazing on the grim ramparts of the castle from the Elvet Bridge below today, and afterward walking about its parapets, I could easily check up this quaint description. No trace of moat or drawbridge remains, but despite various deplorable attempts at "modernization," the various gates he describes are easily identified.

It seems that the City of Durham in the olden days was frequently the scene of terrible fires. On several such occasions, an old chronicle tells us, the flames were stayed by bringing forth the bones of St. Cuthbert and carrying them in procession. Similar miraculous powers were attributed to the "Banner of St. Cuthbert" with the Sacred Host in its center and suspended from a lance. Once the banner-bearer suddenly forced himself into the very heart of the fire. During an hour and more, the flames surrounded him, the wind constantly blowing the banner's fringe into the flames. None of the spectators believed he could survive. Borne down by grief, they said to one another: "A great loss hath fallen upon us today, for verily the banner of St. Cuthbert has been consumed by the flames!" They called loudly on the bearer to come back, but in vain. Finally the fire died down, "not being able to spread beyond the bounds consecrated by the banner." The wind fell and the monkish chronicler continues, "every misery of the first despair was now, by the intervention of St. Cuthbert, turned into compassion of the glory of God." The banner was uninjured by the fire, not even being stained by smoke "which, to all who saw and touched it, appeared exceedingly marvelous."

Curiously enough, the erection of this Norman Castle was intrusted first to a Saxon Thane, one Waltheof, who had made a friend of Walcher, the first Norman Bishop of Durham. Having made his own submission to the Conqueror, Waltheof was rewarded with the Earldom of Northumberland. In 1080, after the murder of Bishop Walcher at Gateshead, his retainers fled to the castle and defended themselves successfully against a superior force of insurgents, who "raged up and down the streets, eager to slay as many of the bishop's people as they could lay hands on." How important a fortress Durham had become in 1088 is shown by the fact that when Bishop de St. Carilef joined the rebellion against William Rufus and the King ordered

(*Concluded on page 14*)



In the courtyard of Durham Castle, the portico on the left forms the main entrance to the building and is an interesting example of Norman carved work. Here where in olden days knights, bishops, princes and their retinue assembled, university students now come and go to their classes.

Spell-binding Agitators of Italy Lose Caste

That's What Happened When the Fascisti Took Hold of Labor Situation

By SAMUEL CROWTHER

IF YOU had stood at a certain busy street intersection in Rome last May you would have had considerable light on why things happen as they do in Italy. Six streets meet at this point. It is the rule in Rome to turn to the left; in the Campagna, the country district outside the city, the rule is to turn to the right. But no one cares anything about the rules; if it strikes a driver's fancy he will go to the right in Rome, frantically waving to oncoming cars that such is his intention. It is taken for granted that a man has the right to take an independent stand on traffic rules.

This intersection is not what we should call busy—there are only forty thousand automobiles in all Italy—but what with three lines of street cars, the motors, and the horse-drawn victorias they manage as a rule to get themselves fairly well messed up. The chief of police said that this must not be; traffic must move freely. Late one afternoon he stationed himself in the middle of the street and deployed about a dozen policemen at strategic points. He waved his arms, his officers waved their arms, the drivers waved their arms, and every mother's son of them yelled. The cafés emptied; the immense number of people in Rome who never have anything to do joined the fête. The drivers and the police cursed each other as only Romans can; then they cursed each other's immediate families and having exhausted them, turned to ancestors. When the conversation had passed great grandfathers, the chief called the party off and went home. For something more than an hour not a wheel had passed the traffic control!

Just this same sort of thing had been happening in the Italian parliament before Mussolini turned up. There were thirteen major parties, but most of the parties had minute subdivisions of opinion, so that careful statisticians say that there were actually thirty-two parties. The parties represented sections and formulas. They were blocs.

South Italy Is Lazy

THE various sections of Italy have produced distinct types. In the south the men are small and very dirty and very lazy. In the northern provinces the men are bigger, thriftier, and cleaner. They want to work and are among the best mechanics in the world. At the big machine shops in Turin and Milan they told me that they could go out among the unskilled men at any time and pick up all the tool makers they needed. There is no leadership among these men and also no initiative; they will rarely leave their jobs and if discharged they will usually wait around until they are hired again. In the south it is different; the Romans are children and they like to play Julius Caesar. They do not mind working, but they need stimulus. If in July you order a pair of shoes to be done by the first of September, you will get an elaborate promise and on the first of September you will find that the shoes have not been started. But if you say that you must have a good pair of shoes in time for a christening two days away, you will get the shoes. They will arrive just about five minutes before the time when you said you were to start—but they will arrive. Also they may not be the kind of shoes you ordered—if some other customer has bullied the shoemaker into getting a pair through, you will get his. A self-respecting man cannot go barefoot to a christening; what matters the size?

As one goes farther south the population gets steadily lazier and dirtier; Naples is very bad; Calabria is worse, and Sicily is still worse. For instance, at Messina the people are still living in the shacks put up after the great eruption of Mt. Etna in 1910. They live in them because they do not have to pay rent. The few buildings that have been erected have been put right on top of the debris. It is from these sections that we draw most of our immigrants.

The war upset all Italy. The farmers and the workers at home made money; the soldiers, of course, did not. They were promised everything by the politicians during the war. When the war was done, came the peace out of which Italy thinks it got nothing at all. The working people saw great companies like one organized by the Ansaldo Brothers spending money right and left buying up companies and apparently having all the money in the world.

Easily Led by Phrases

ALL the various kinds of Italian workers have two points in common—they are easily led by phrases and they love abstract political doctrines. Soviet Russia poured an immense amount of money into Italy in the belief that the government could be overthrown. They, too, knew that the Italians love oratory. There has been for some years quite a large Socialist party in Italy; a portion of them were easily turned radical. The time was ripe. The war government had been very generous with borrowed money; the post-war governments found themselves unable to stay in power unless they, too, were generous with property which did not belong to them.

And then a great many things happened. In the north the workers occupied the factories; it was quite a harmless proceeding and not nearly so violent as was represented. Take the Fiat works at Turin. I talked with Senatore Agnelli, the managing director and the man who has really made the works. He said:

"Things looked ugly and we knew all about the plans to seize the factories. So we quietly took away all our account books and plans and other valuables. When the workers' leaders came asking for the place we let them have it without a word. All the executives, all the engineers, and the whole office force went home. The men, of course, did not know what to do. They spent several days in discussion and then made a show of operating. They assembled in all six machines in a fortnight and they could not sell even those. Just before then we were turning out from sixty to seventy cars a day. When pay day came there was no money. When they needed materials there was nothing with which to buy them. Then the men began to awaken to the fact that their leaders were simply long-tongued fools. They found that ownership was not all it was supposed to be."

The railway workers presented a more serious problem; they were all in one big union and they had the government with them—the roads were owned by the state and the director of railways was hunting for political power. The men did what they pleased. They put in an eight-hour day that was an eight-hour day—a crew quit at the end of eight hours and the train stayed where it was until another crew came along. They reduced third-class fares to almost nothing and increased first and second. They refused to allow officers or prosperous looking people to ride. They killed a number of officers. Trains often stopped for hours while the crews debated policies. They had 240,000 men, whereas even with the eight-hour day they needed not more than 180,000, while in 1913 the roads, doing more business than with the high personnel, had only 148,000 men. They raised the average of salary from around two thousand to above eleven thousand lire a year and in spite of larger gross receipts managed to turn a pre-war profit of about one hundred million lire into a deficit of one and a half billion lire. Italy put the Plumb Plan into effect with a vengeance.

Workmen all over Italy took it from the leaders that they ought to have high wages, do little work, and be rude to everyone suspected of having money. As an English physician who has lived in Rome for many years told me:

"You could not go out into the street without being insulted. If a man came into your house to do work he not only insulted you but also spent as much time destroying your property as in repairing on the job for which he was supposed to be there. One had no redress. Since Mussolini there has been none of this."

The eight-hour day was put into effect by law in spite of the fact that Italy had no money or machinery to make up the difference in productivity between eight and ten hours. The high taxes prevented the accumulation of capital to buy such machinery. Wages, through frequent strikes, went from the three to five lire of pre-war times to twenty to thirty lire, and prices increased until at the top they were five times those of 1914. Now they are about four times. The people who lived on incomes, as well as the professional people, have had a hard time for they have not been able to follow the workmen. In the midst of the boom, financed largely on the printing of money, the big Ansaldo Company crashed, carrying with it the Disconto bank—one of the four big banks of Italy. This convinced the people that they were being buncoed by the government—they were right. They were being buncoed by everyone.

Castor Oil Efficacious

IT IS not natural for an Italian to be rude, but they are emotional and also they cannot stand social pressure. They like to be in fashion. They followed leaders in being violent. If a workman were not a "Red" he was an outcast. Things went from bad to worse; the lira fell so low that it was all but out of the question to import any considerable quantity of goods from abroad—and it is necessary for Italy to import.

Then came the Fascisti. They gradually organized as a party but they are really an economic reaction. The youth of the country saw everything which they respected and cared for cursed by flannel-mouthed soap boxers. They saw, as the cowed workers could not see, that the end of the business would be a Russianized Italy. They had a notion that the Communist leaders were all cowards and would not stand up before a determined fight. So here and there little bands of young men started to give the Reds a taste of their own medicine. The movement was unnamed and unorganized. In one case five boys—none over twenty years—took a whole town from the Communists. What made these boys strong was their brave recklessness. They were not afraid to kill or be killed. Gradually under one Benito Mussolini, a newspaper editor of Milan, the boys began to organize. They called themselves Fascisti, which means literally a bundle of fagots—another version of "in union there is strength."

Their procedure was usually after this fashion. A quite unarmed boy would walk into a Communist headquarters and say something like this:

"Tomorrow at ten o'clock you will haul down the red flag outside and hoist the Italian flag. Then you will all make a public apology and leave. Of course you can go ahead and kill me now, but in that case I am afraid that I cannot say what will happen to you."

That sort of thing takes nerve. The boys had the nerve. Some of them were killed and in return they killed, but they never started the trouble. They simply insisted that, the organized government having failed to function, they would act in its stead and preserve order. They had nothing of the white "terror" in them; they were more in the nature of the vigilance committees we used to have in the West. They had not been operating long before they made one of the great discoveries of modern times—castor oil as a political agent. Whenever a Bolshevik got too wild in his speeches, it grew to be the habit of the Fascisti to take him into a public square, have him kiss the flag, give him an overdose of castor oil, and send him home. Instead of making a martyr of him, they made a fool of him. And no one bothers to get excited about a fool.

As soon as the terror of the Red domination was lifted from the workers, they, too, started to join the Fascisti. In the meantime the government was changing prime ministers every week or two; a prime minister in Italy, as in most European countries, exists only as he has a majority in the legislative body. With thirteen parties in the Chamber of Deputies, only a coalition could have a majority, and a prime minister lasted only until he asked for some measure to be passed.

It was developing that the only man in Italy capable of doing anything was Benito Mussolini with his Fascisti behind him. The Fascisti, now well organized and with regular army officers at their head, started to march on Rome. It was only a gesture; they were not opposed. As they neared Rome the king asked Mussolini to take charge of the government. His first act was to ask for full powers—to ask that he have the authority of a dictator, but without the name. The deputies granted his request largely because he would have taken control anyway. And he had to take full power because the chamber was so full of blocs that no national business could be done.

His One Idea Is Italy

HE HAS governed well; he has sound ideas of government. The Italians like a leader who can be dramatic; Mussolini can be dramatic to the last degree—but he never fools himself. He can talk bunk when bunk is needed—but he never imagines that his bunk is real stuff. The one idea in his head is not Mussolini—it is Italy. And it looks as though he would be able to make something out of Italy.

That is the impression which I got in talking with him and with the members of his cabinet. He is under forty and so are all but one member of his cabinet—one of the ministers, Sardi, was born in America—and they are doing their work well. They reminded me of nothing so much as the executives of a growing corporation.

In the United States we know Italy mostly as a country which produces shoemakers and vegetable sellers and garlic eaters. We used to know them as a race of day laborers, with an organ grinder or a peanut vendor thrown in. We have always taken an Italian as an Italian and let it go at that. To meet them on their own home ground and find out how many kinds of them there are is something of a revelation and decidedly interesting. But when one examines into Italy and what it has gone through from time immemorial, and what it has gone through recently, the wonder is not that Italians like garlic but that there are enough left of them to like anything. And it may be news to know that there is really no such person as an Italian. Italy is not a country; it is a geographical expression. There are no Italians; there are Sicilians, Calabrians, Neapolitans, Romans, Tuscanese, Piedmontese, and so on, and they have in common only a flag, a government, the same kind of money, and a mutual contempt that finds expression in no end of ways, and especially in politics.

We can learn a lot from the Italians; we can learn how to get along comfortably on nothing a year—which lesson we do not need just now; but we can learn a great deal about how fads and fancies in government work out, for there is nothing that our lovers of the plain people have not suggested for our ills which the government of Italy has not tried in a big way. Government after government and party after party have come forward with this or that plan, by which everyone would have a great deal of this world's goods without the bother of working to get them.

The thing which Mussolini did was to put common sense into government—he said in effect that political toys were all right in their way but that they must be used as toys and not as things to throw into the machinery.

The Old Days and Now

THE people as yet know little of government. Modern Italy dates only from 1870; before then and for ages past it was made up of a number of independent states, some of which had at times been independent and indeed world powers. Rome once ruled the world. Venice once ruled the seas. Genoa and Pisa were great maritime powers. From the fall of the Roman Empire, the Italian peninsula was a nest of little states—some were republics and others were monarchies. They spent a fair amount of their time fighting with one another and they developed nationalities of their own. Italy is not a rich country, but in the old days when iron and steel were used mostly for weapons, and coal was not necessary, for there were no steam engines to run, she got on fairly well. The forests provided the necessary wood and the soil was fertile enough to support the small population—small by present standards, but large for the old days. Italy was the seat of civilization and culture; the Catholic church ruled the spiritual and a good deal of the temporal world from Rome; nearly all the rulers of Europe had to receive their crowns from the Pope. While the English nobles were living in rude stone castles, drinking ale and wallowing in great platters of food, the Italian nobles were living in rooms decorated by the great painters of all times and eating from golden plates of exquisite workmanship. Also they know the technique of fighting.

More powerful countries rose to the north, and one by one the Italian principalities lost their independence or traded it for some kind of protection. Austria became the dominating power. Then came Napoleon and some-

Free Souls Driven From Capital of Culture

Exit Duelling, Enter Street Lights—Everything's Spoiled for Californians

By HARRY H. DUNN

CARMEL-BY-THE-SEA, for more than twenty years given over to Art in the midst of Nature in all its naturalness, where open springs took the place of water mains, where lanterns flickered instead of street lights, and where the cutting of a tree was a cause for immediate excommunication of the cutter, is about to be abandoned by the Free Souls of the world of goosequill and crayon, harpsichord and buskin. Very shortly there will be a number on each house, an arc lamp on each corner, and, most humiliating of all, a paved street for every cow-path. This means that there is to be a new capital of culture in California, though the capitalists of this culture by no means admit that its capitalism is limited to one state, or even to these United States. For the capital is to be moved about fifteen miles down the California coast, to a sequestered area of some hundred acres, at Notley's Landing—and Art is going to take tickets at the door from those mere mortals who desire to see Her sons and daughters at work.

The Carmelites, that is, the old original settlers, who, two decades ago, had never heard of the place, are getting to feel crowded. Originally laid out by an enterprising real estate man as a retreat for creative artists, Carmel was first settled by George Sterling, poet, who soon attracted to the golden sand dunes, curving above the shallow, foam-rimmed sea, a select coterie of artists along other lines. Quaint customs sprang up; houses were built hidden amid the trees; if one of the trees interfered with the view of the sea, the would-be viewer walked around the tree, and still saw the sea. The Code Duello was imported, a field of honor staked off, and what are commonly known as fist-fights in places where police are more frequent, were staged with all ceremony. The police department of Carmel admitted that he could not compete with the artistic impulses which impelled these men of the Ultimate West to their affairs of honor, and retired from the sand dunes to the main road of Carmel to keep watch over less dangerous auto-speeders. Among the famous duels recorded were one between Harry Leon Wilson, well-known author of commercial fiction, and Theodore Criley, painter, and one between the leading butcher's delivery boy and another writer whose stories have had their greatest circulation through his reading of them to circles of admiring friends. Still another duel impends, for Dr. George M. Dorwart, retired minister, has challenged Argyll Campbell, city attorney, soldier of fortune, actor, author and playwright, and Campbell has accepted, weapons and place secret. Possibly the duel has been fought, who knows?

But this matter of duelling is no matter for laughter. Indeed, it is one of the straws which has broken the back of the camel of art, and is to be settled definitely before the Free Souls of Carmel become the Free Souls of Notley's Landing, some fifteen miles away. To get back to the cause of the migration of Culture from its Capital in the New World, however, it should be recorded that from a population of one poet twenty years ago, Carmel has grown to some 1,200 inhabitants. The majority of these want the improvements which civilization offers to modern life. They seek paved streets, numbers on the houses, corner lights, a modern city hall, though Carmel is only a city of the sixth class, and not yet entitled to a mayor; they demand a water-supply system, sewer lines, and the cutting away of at least some of the trees and underbrush which hide the sea from the town. At the last election Perry Newberry, author, raconteur, and leader of the art colony, was elected by narrow margin to the office of chairman of the board of city trustees, and thereby he assumed the title of "mayor," to the dismay of the "moderns" who had opposed him.

These "moderns," however, are getting stronger and stronger, and now the Free Souls, crowded to the limit of endurance by the progressives, are preparing to found a new art center. Armed with the endorsement of rather more than half of the artists in Carmel, "Mayor" Newberry has just presented the completed plan for the new colony, which is to occupy approximately 100 acres at Notley's Landing, on the coast, about a three-hour hike south of Carmel. Here are the rules, as originally formulated, and which, with one exception, are to be adhered to in the infant metropolis of the Muses:

1. No duelling.
2. No persons other than the charter members of the original charter company of Free Souls to be admitted to residence in the colony until they have passed with satisfactory degrees a stiff examination as to their artistic abilities.
3. Sightseers prohibited until they have paid an admission fee entitling them to remain a certain brief period within the community. This fee is tentatively agreed on as five dollars, though this amount has not been officially fixed.
4. Immediate setting up of a community fund chest, to which each member shall contribute in proportion to his or her income, from which payments are to be made by the treasurer in charge to each artist who is not earning enough to supply him or her with a livelihood, until such time as said artist's income equals his or her necessities. Such payments are to be made only according to the actual need of the person receiving them.
5. Performance of labor by any person for any other person in the colony is rigidly prohibited. All public work for the common good is to be done by the artists themselves, each person giving a certain part of his, or her, time every week to co-operative work on trails, paths, roads, and such other work as may be necessary.
6. Each member of the colony to solve his or her own problems of water supply, lighting, sewerage, drainage, and so on.
7. Commercial establishments of all kinds strictly prohibited.

These foundation stones for the building of a co-operative capital of culture anew on the California coast were accepted, with the exception of the first, which caused an immediate and acrimonious dispute at the meeting of the ways and means committee of the Free Souls, a meeting held amid the gastronomic delights of an extremely material restaurant on Carmel's main street. When the 'no-duelling" clause was read, Ernest Schweninger, one of the seconds in the now historic Wilson-Criley duel, leaped to his feet and burst into a speech in favor of duelling, an argument which was supported by the majority of those present. Newberry defended the ban on duels, but lost the argument, and that rule is now being changed to permit combats of honor when approved by the Duelling Committee, yet to be chosen from the half-hundred charter members of the new colony. The only other alteration made in the rules is to be the addition of one putting a permanent ban on telephones.

Above—PERRY NEWBERRY, Mayor of Carmel, and leader of the artists who are preparing an exodus from that capital of culture because some of the plebeian townspeople insist on having electric lights, sewers, piped water supply, paved streets and other sanitary arrangements. Below—The gnarled and mysterious cypresses of the Carmel coast, the only ones of their kind in the New World, and from which the interpretive dancers of the Carmel colony of artists have taken the patterns for their postures in a number of what the less artistic neighbors call "synthetic" dances. These dancers have refused to join the exodus of artists from Carmel, but prefer to remain in contemplation of their beloved cypresses.

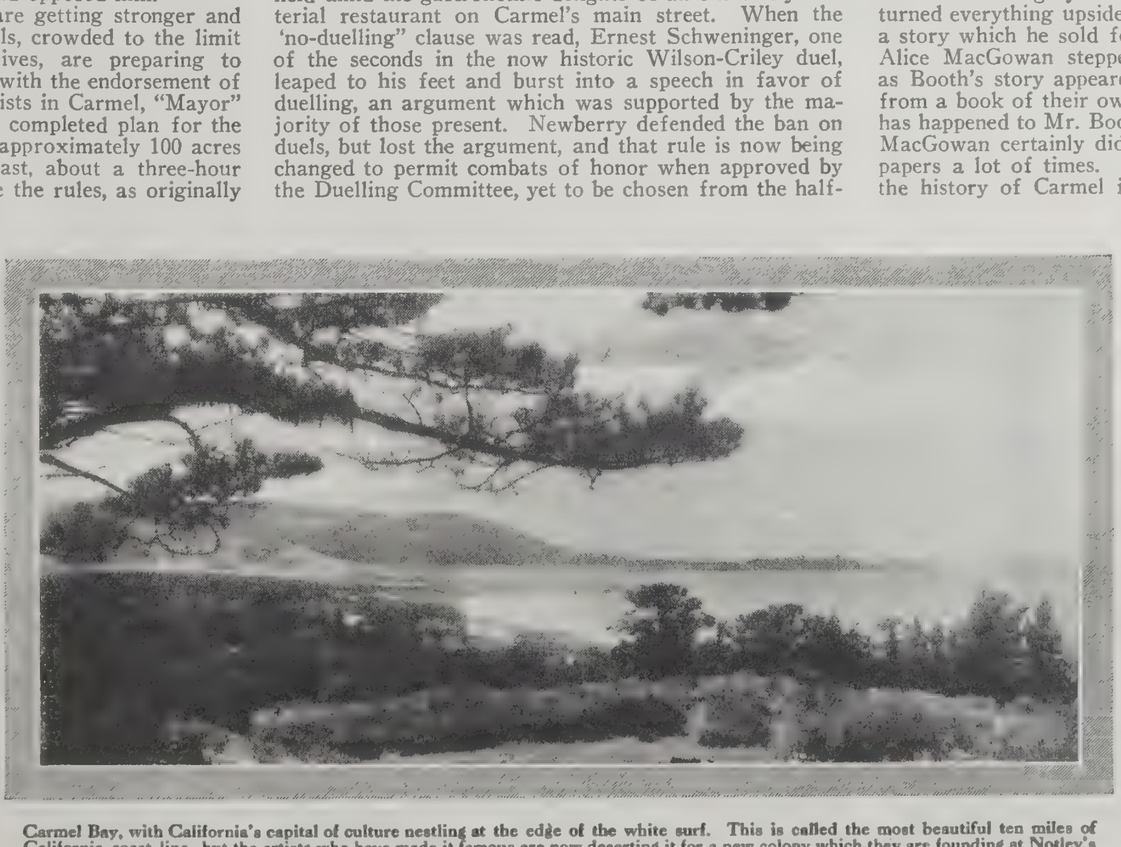
Among the charter members of the new colony, whose associates avow they seek to be as free as air, besides "Mayor" Newberry, are Evan Royal Mosher, painter; Grace MacGowan Cooke and Alice MacGowan, novelists; Argyll Campbell, actor and playwright, who will abandon his office as city attorney of Carmel to join the exodus in the name of art; Yolande F. Swain, poet; John Howard Flannery, composer; Jeanne Burton, poetess; three Brothers Josselyn, musicians, actors, playwrights, short-story writers, and minnesingers; David Alberto, pianist; Laura Maxwell, artist; Ernest Schweninger, song-writer, adventurer, globe-trotter and writer; Katherine Cooke, playwright and actress and Cornelius and Jessie Botke, painters. More than as many more have agreed to join in the migration of the masters of art, but these are the leaders who have been working on the plan for more than a year, bringing it to completion only in the spring of 1924.

The conservatives claim that Carmel is becoming too modern to be the proper ground for the rearing of brain children to successful action on the stage of the world. An incorporated city government is no kind of foster-parent for creative inspiration, declare the Carmel Cognoscenti, and the Independent Intelligentsia concur completely with the C. C.'s. Then, too, there are too many summer visitors at Carmel, though there be some of the progressives at Carmel who do insinuate that if the aforesaid Intelligentsia could charge and collect a head tax on all the summer outlanders who visit the capital of culture—as they hope to do at Notley's Landing—there would be no exodus of the artists. That, however, is a matter of opinion, and probably cannot be settled, even by one of the unforbidden duels at the new co-operative colony.

Carmel's history, though brief, is vivid. Not infrequently the volume of artistic production becomes too great for the little city on the sand dunes of Carmel Bay to retain, and culture just boils over the whole surrounding landscape from Siskiyou to San Diego and from the snow-crowned Sierras to the shores of the Sunset Sea. Recently there was an almost-riot because a fire engine purchased by the Progressives was painted conflagration crimson instead of embers of flame, the Conservatives contending that the fire engine's color should represent the accomplishments of the engine, rather than merely the fire it is intended to put out. Not long after that F. A. French attended the production of "High Justice," a play written by Carmel playwrights and produced under direction of Herbert Heron in the Capital of Culture. Now, Mr. French was welcome to the show, but not so welcome to criticize it, as he did afterward right out in public in a local paper. The protagonists—I understand that is the word—of the play claimed that, because the leading lady had a fever and the ingenue two cracked ribs, the show should not have been reviewed on its production, but on its intention. Carmel is still divided on the resulting question of whether a leading lady's temperature should be considered as affecting her temperament.

Then a naughty man named Booth just went and turned everything upside down in Carmel when he wrote a story which he sold for $1,200. Perry Newberry and Alice MacGowan stepped right forward, just as soon as Booth's story appeared and declared it to be a theft from a book of their own composition. So far, nothing has happened to Mr. Booth, but Mr. Newberry and Miss MacGowan certainly did get their names into the newspapers a lot of times. But by far the saddest page in the history of Carmel is its invasion by a well-known American game in which one card is dealt to each person around the table until every person has five cards. This was revealed when a real artistic program was given by David Alberto, pianist, in the new Carmel Arts and Crafts Theater. Though this was an artistic party, intended mainly for the artists, not enough of them attended to pay for the lights, yet the performance struck a high note in artistic accomplishment; for a fact, it did. Everybody wondered where the artists were, and John Howard Flannery, composer, critic, and leader in the coming exodus of art, answered the unspoken and spoken questions when he said, right out in the middle of the program:

"There are more poker players in Carmel than there are lovers of real art. The artists are not here because too many are in their smug hutches playing poker."



Carmel Bay, with California's capital of culture nestling at the edge of the white surf. This is called the most beautiful ten miles of California coast line, but the artists who have made it famous are now deserting it for a new colony which they are founding at Notley's Landing, which lies on the point poking out to sea in the right background of this picture.

Zero Hour Striking for College Athletics

Time for Reform Here, and It Must Come, or Entire Structure Will Collapse

By A Veteran Sports Writer

We have published an article in which actual cases of professionalism or badly tainted amateurism were cited by the writer; this week a further discussion of this grave crisis in our college athletics is presented from the pen of the same author, a distinguished sports writer.

COLLEGE athletes are showing a growing tendency toward commercialism. Many educators are alarmed over the condition. They are giving public expression to their fears. They are discussing many and varied remedies and agree that something must be done about the matter.

Conditions in college sports have not improved in recent years. The path has led downward, rather than upward. The lure of gold has become greater and the spirit of sport has been losing ground.

Each football season there are numerous charges of professionalism. The finger of guilt is pointed in all directions. The accusations frequently reached the public ear. The college baseball season is a repetition of the football season. Here, again, come the charges of professionalism.

The time for reform is here. The structure of college athletics is swaying and unless action is taken there will be a collapse. Year after year has come an avalanche of words upon the subject, but words will no longer suffice. Action, long delayed, is needed.

If there is to be a reform in college athletics, and it is certain that one must come, then the reform cannot arrive in new laws, rules and regulations, as so many suggest, but in the abandonment or moderation of some of those that exist.

Legislation will not stamp out the professional tendency in college sports. Some of the gentlemen in charge of the situation believe that the only solution lies in stricter laws, but one of the chief faults of the present system is an overabundance of rules, excessive legislation. What is needed more than prohibition is temperance.

Those high in the councils of collegiate pastimes have suffered from what is more or less of a national sin. They have gone to extremes and, having gone, insist on seeing the rules through, refusing to compromise or tamper with the laws of the book.

Amateurism, in the strict sense of the word, is impracticable in the United States. To demand that athletes live up to the strict letter of the law means the encouragement of hypocrisy and deceit. And in this hypocrisy and deceit there is far greater danger to the athlete than in the taking of money for his services. It is destructive to the moral character of the man.

Many eloquent addresses are being delivered on the evils that beset college athletics, the growing tendency toward professionalism, the curse of commercialism. This same eloquence has marked the winter season of each year in a considerable stretch of seasons. But the same orators have failed to go beneath the surface. They have not given words to the cause of the proclaimed evil. The men who deliver themselves upon the subject have apparently never done more than touch the covering. They have not tilted the lid and looked beneath. Their war has been upon the effect and not upon the cause, upon the results and not upon the reasons. The most important angles of the situation have been ignored.

Often those that point the finger of guilt are among the men that are to blame for the guilt. They are among the men that have contributed the chief cause for the condition so widely deplored.

In a recent address a famous educator told his audience that college sports were becoming more and more commercialized and he tried to give an explanation for it. He said the cause was the sports pages of the daily newspapers. These pages, he explained, devote their columns almost exclusively to professional sports. The athletes read the columns. They discover that a certain major league ball club signs a player for a salary well up in five figures; that another major league team buys a player for a figure in the six figures; that baseball made millions of dollars in the previous year; that the world series had greater gate receipts than in any previous October; that a hockey player receives several hundred dollars for each game; that a man playing professional football gets as much; that a pugilist demands a million dollars for his end of the purse to fight for the world's championship; that another pugilist refuses to fight for a paltry $250,000; that tennis stars are to receive money for playing; that golf professionals are making from $10,000 to $30,000 a year; that fabulous sums are paid to the pros. for a single match; that ski jumpers get $200 a week; that pro. basket ball players get as high as $250 a game. Day after day, in each issue of his favorite newspaper, the young athlete reads these facts. Always, when he reads of a sporting event, the event is linked with the dollar mark. In his mind sport and money become inseparable companions; he cannot think of one without thinking of the other. He naturally concludes that sport cannot be conducted without remuneration. The tone of the newspaper columns is then, according to the educator, the reason for the spread of commercialism in our colleges and universities.

Hasn't Read College News

THIS educator evidently has missed a great deal on the sports pages of the daily newspapers. He has not read the college sport news and of this quite a bit is being printed in the newspapers, more now than ever. And, had the educator read the sports pages, he would have found the real reason for the spreading tendency toward professionalism. There, on those same pages, we discover that one university is completing a stadium costing two million dollars; that another university is starting one that will cost at least as much; that another university is planning to build one more expensive than any of the others; that certain universities are going to extend the seating capacity of their stadiums to get bigger crowds and bigger receipts; that such and such university exceeded its previous football profits by many thousands in the past season; university football teams playing for $50,000 guaranties; universities engaging football coaches for salaries in five figures; university football teams taking trips across the country to engage in holiday games; universities charging five dollars a seat for football games.

If the athlete reads the sports pages as carefully as he is credited with reading them he certainly will read the news of the college sports, since he is vitally interested in them. If he is deeply impressed with the monetary advantages of professional sport, how much more is he impressed, then, with the commercial value of his own college sports. It is only natural for the athlete to assume that, since the apparent object of college athletics is to secure as many dollars as possible in the athletic treasury, his services should be rewarded with something more substantial than a letter. He feels that since he brings such tremendous revenue into the treasury he is entitled to a small share of it. That is only human.

Colleges and universities have more and more developed the commercial tendency. The gate receipts have been uppermost in mind with those at the head of college athletics. The football schedules (and football is the great paying college sport) are so framed as to provide the greatest revenue. The team that is in the greatest demand is the team that can guarantee the largest crowd. Teams that are drawing cards are the teams that will find favor over the traditional and poorer rivals.

What an Amateur Is

THE athlete readily understands the purpose of it all. Being young and impressionable he catches the flavor of the thing. He decides after a while that since he is instrumental in providing these big receipts he should share in them. The frame of mind of a college athlete is, after all, merely a reflection of the condition that has arisen in the battle for the dollar at the gate.

To be an amateur athlete a boy must never have received money for his services. That is the strict interpretation of the rule. A great many boys have received money for playing ball, playing football, running in races or appearing in some other form of sport where they took pay for their services.

Summer baseball offers one of the simplest methods of earning money. Many of the men engaged in varsity athletics have playing ability on the ball field. They can with ease get positions on semi-professional teams or some of the minor league teams in the summer months. Many young men have used this means of employment to pay their way through college. After school opens they engage in some form of college sport. To do this they must appear as amateurs and deny that they ever received money. To evade the penalty attached to taking money, which in the case of colleges means being barred from athletics, they deny ever having received money. To cover up the evidence, they play under assumed names.

Here we have the greatest evil resulting from the amateur rule. The boy's love for athletics causes him to play under a name other than his own and later on to deny that he played for money. He practices deceit and hypocrisy. The practices that he indulges in are ruinous to his moral character.

Scattered about this country are many young men who have played summer ball for money. Some of them played on factory teams, some on semi-professional teams, some on hotel teams and others in minor leagues. These boys are engaged in some form or other of college sports. They are posing as amateurs, denying their summer occupation and their violation of the amateur code.

Often He Is Excused

DISCOVERY and positive proof may mean disbarment and, again, it may not. Often the athlete continues playing even after he is found out. Excuses are discovered and accepted. This is really official encouragement of the deceit.

The professional tendency among our college athletes would probably not be entirely erased by playing baseball in the summer months, but it would be considerably relieved. The utter prohibition provided by the college law at present has resulted in a general collapse of the object in view, which is sport for sport's sake and the development of the physical as well as the mental side in our educational institutions.

Colleges are not going to quit trying to get as much as possible in sports. They will continue planning for the largest possible revenue. They will, unintentionally, continue encouraging the professional tendencies in the athletes. They are ever associating the dollar with college sports, planning their schedules so that the highest profit can be derived, and it is but natural that the college athletes will continue associating the dollar with the game and the athlete will be inclined to make the varsity aim his own and individual aim. This is the natural effect of the condition that exists.

Permitting summer baseball, as several universities already do, will in a measure relieve the situation. There is, as has been pointed out, nothing dishonorable in getting money for playing baseball in the summer months while there is every dishonor in playing under a fictitious name and making a flat denial later on so that the player can retain his eligibility.

New rules will only muddle up the situation more and more. What is needed most of all is moderation of the existing rules. The boys cannot be expected to ignore the lure of the professional aspect when it is so appealing to their masters. And the masters do not seem able to overcome it.

The Sunny Side of Main Street

Concluded from page 3

and glitter, creators of drunkenness and misery; two or three picture theaters; a plenty of stores of all sorts and conditions. Oh, yes indeed, a very thriving Main Street, but on its way to be a big city, and, therefore, Main Street no more and more's the pity.

In olden days, in my young days, there was one policeman here, busy from year to year doing nothing much. Now there is a handsome police station, doing a roaring trade! Blessed are the advances of civilization! There is a public library, a small town hall; several motor garages; two weekly newspapers; chapels and churches and a Salvation Army hall. At night Main Street is real busy, under the blaring white light of the big electric lamps. A jostling crowd; many pale-faced girls and youths passing up and down, interchanging chaff and chat. The picture houses are full, hot, perspiring; so are the saloons and beer shops with thirsty throngs talking, laughing, drinking, smoking. But the side streets are for the most part quiet; there reside the sober-minded, sober-moraled Main Streeters, those who wonder what the world has come to and hope that it won't go any further.

III.

Though I am city-minded, I am not one of those who look down a supercilious nose at Main Streeters. There are many, who know no better but who should do so, who count them as narrow-minded, old-fashioned, slow, these poor, benighted inhabitants of Main Street, who are so sadly lacking in "cultchaw" and who are so hopelessly behindhand, stagnant, prudish, puritanical; they don't live, they exist. They are born; they die. They leave no mark. They may be useful; they are not ornamental. Their minds are like their clothes, in the fashion of yesterday. Poor dears!

What really is Main Street? It is not the deathly, stifling back-of-beyond depicted by some of your and some of our novelists and playwrights. In my estimation Main Street speaks for a great deal in the life of England and America. Main Street is chiefly an attitude of mind, and not all a bad attitude. Main Streeters are laughed at, written at, sung at, even by some of those who themselves were born and sometimes bred among them; who deserted them while young, snared by the lure of the big places where alone big money and fame are to be won, and where too often souls are sold. You cannot become famous or a multi-millionaire in Main Street; but dollars and notoriety are not the only things which are worth while. You can prosper and be happy in Main Street.

The mentality of Main Street is tinged with provincialism, "they" say. You might as well lament that a country town is colored with country. It is the dull-eyed that only see the dull side of Main Street; there is a sunniness there that you will not find in New York, London, Chicago, Glasgow; a sunniness of atmosphere, and also often of mind and temperament. The picture that is usually painted of Main Street is one-sided therefore misleading. A half truth is more difficult to slay than a whole lie.

Can anything good come out of Main Street? Why not? From what reservoir, I ask you, is the lifeblood of the great cities reinvigorated? Renewed? It is from Main Street. The big men have mostly come from Main Street; as a rule they are not city born or at most are removed from Main Street by one generation. The minds of Main Streeters are untilled fields, the soil rich; city minds have borne many crops, are anemic, have to be manured, enriched, stimulated; they have grown feverish and fretful. There is a serenity about Main Street that is wholesome.

Shakespeare was a Main Streeter; so were Carlyle, Thoreau, Dickens, Lincoln, Johnson, Mark Twain, and a host of others, a goodly host. There are stamina, strength, common sense, desire, doggedness, persistence in Main Street blood and brains that only need stirring and strife to make them blossom and bear fruit. Main Street nourishes its offspring on stupid, wholesome fare —mental, moral and physical. The great cities are hard-breasted mothers.

Main Streeters have the breath of Nature in their nostrils; inherit her blood and bone. Those who go down to their business in great cities breathe the close air of the pavements and of the dollar-market.

Woe to any country in which Main Streets are no more! It cannot be healthy or sane.

I do not love Main Street with *all* my heart; I would not dwell therein! But it is possible to appreciate that which you do not entirely love. The ill parts of Main Street I clearly see; its immoralities and unmoralities; its dullnesses and defects; the much that is poor and evil. I can see also the far greater good that is there, and do realize that Main Street has played and is playing a big part in the history of America and England. *Floreat!*

German People Still in Center of War Stage

Bavarian Statesman Pictures Plight of Countrymen Under French Thumb

By COUNT HUGO LERCHENFELD

FORMER PRIME MINISTER OF BAVARIA

This statement of conditions in Germany may be taken on the word of a gentleman who sees the world situation clearly. Count Hugo Lerchenfeld, former Prime Minister of Bavaria, and a recent visitor to America, describes a situation that the whole world has recognized as the chief international wound remaining, and is now beginning to recognize as a very serious menace of new international infection.

"ALL the world's a stage"—a stage full of dramatic action. The more fortunate of our contemporaries lean back in their seats, look on, comment, applaud or hiss. If the play is acted by a foreign company in a foreign language, the audience needs some explanation lest they misunderstand what is going on and misjudge the motives and characters. I should like to act as interpreter of the German play.

We Germans are still forced to remain in the middle of the huge stage which was the scene of the World War. Heaven knows, we should like to retire into private life to work and to go about our own affairs, but unfortunately every man's hand is against us.

When I sailed for the United States the curtain had just raised on a new act, the occupation of the Ruhr and new methods in the occupied territory. France and Belgium were in close co-operation; England refused to join her allies in this new venture. American public opinion was divided as to whether the invasion of the Ruhr was legal according to the Peace Treaty. Six months later the highest legal authorities of England declared it to be a breach of the treaty, thus establishing a standard for public opinion and justifying Germany's repeated protests.

The invaders were faced in the Ruhr by the only resistance left to an unarmed and defenseless people, the weapon of Gandhi and the Hindus in India, passive resistance. It is a great mistake to consider this movement as ordered by the German Government. The sturdy workmen and miners in the Ruhr have always been a hard-headed, independent lot of fellows, brooking no interference, trade unionists all of them and naturally opposed to militarism.

Under French Military Rule

FRANCE had proclaimed to the world her intention of sending a staff of civil engineers with a few soldiers as protection into the Ruhr to fetch the coal and steel which she claimed as reparation; but instead of carrying out this ostensibly peaceful mission, a great armed force with tanks, airplanes and cavalry entered the mining districts and manufacturing towns. French soldiery tried to force the miners to mine and load coal at the point of their bayonets. Would they have been men if they had consented to work under such circumstances? One act of violence led to another and the French, exasperated by their lack of success, used more cruelly severe methods from day to day as they realized the truth of the old proverb, that one man can lead a horse to water but the whole French army cannot make him drink.

The German Government was forced by the spontaneity and strength of the passive resistance, under pressure of public opinion in the whole country, to organize the movement in co-operation with the trades unions and the great industrialists. Although many prominent Americans have been in the occupied territories and have seen with their own eyes what has happened there, the American general public has no conception of the hardships which the military régime has imposed on the population. Especially since the invasion of the Ruhr, all measures have become more drastic. For instance, when the French took over the railroads, they expelled thousands of railroad officials with their families, who refused to work for the French authorities. These people were obliged to leave on a few hours' notice, leaving all their belongings behind them. The children coming home from school at noon would find the family evicted on the street, their home, with all its furniture, linen and provisions, in possession of French railroad officials. City and government officials, leading business men, directors of banks and factories, were relentlessly expelled, it being the French policy to deprive the population of all kinds of leadership, leaving it helpless and intimidated.

Under the pretext of assuring reparations and the cost of occupation, the French took over the financial administration, collecting all taxes and revenues that belonged to the government. This applies especially to the state forests which in Germany are very extensive and splendidly administered, thus forming a valuable source of public revenue.

Cut Off From Germany

THE occupied territory was separated from the rest of Germany by a rigorous customs system, although the Rhineland, as the greatest center of German industrial production, is essential to all branches of business. Many products have to be bought abroad, coal, for instance, from England, and this constitutes a tremendous drain on the financial capacity of Germany. The French and their faithful allies, the Belgians, went even so far as to seize any amount of cash in the banks and in the factories which they could lay hold of on the ground that this money was meant to finance passive resistance.

One of the greatest hardships, not only from a business standpoint but also humanly speaking, has been the shutting off of the Rhineland from all communication with the rest of Germany for weeks at a time without apparent reason. From one day to the next, post and telegraph were suspended, the trains stopped, no travelers allowed to leave or enter the occupied territory. Families were separated, mothers not allowed to return to their children even in cases of desperate illness. Many persons were shot while attempting to cross the frontier.

Even after traffic was resumed, I spent two hours waiting in a small station between Cologne and Frankfurt while the French authorities searched the express train and examined the passports—and this was after passive resistance had been abandoned.

In the years following the Armistice, large numbers of black troops were used for the purpose of occupation. Coming, as these troops did, from the African climate, it was found necessary to send them to the South of France during the coldest winter months, and every year during the weeks between November and March while they were in winter quarters, some French general or politician would announce loudly for the benefit of American prejudices that "not a single black soldier is stationed on the Rhine." The Moroccans who have replaced them are certainly no Negroes, but they are decidedly colored and scarcely civilized; any American would consider it a deep humiliation to be ordered about by them.

Military occupation is always unpleasant, especially in such a densely populated area as the Rhineland; but the same Germans whom the French and Belgians consider it necessary to treat so severely that they are almost driven to despair, lived on the most amicable terms with the American forces, while those in the British zone consider themselves most fortunate. We never hear of unpleasant incidents of expulsions or imprisonment where the Union Jack flies; people are sure of being treated with justice when they have recourse to the British authorities. And the same may be said of the four years of American occupation in Coblenz, where the departure of the sentimental doughboys was greatly regretted, especially as they were replaced by "poilus" and Moroccans.

The invasion of the Ruhr took place during the chancellorship of Dr. Cuno, who is well known in America. He and the members of his Cabinet were moderate men, neither socialists nor nationalists. They were perfectly aware what moral and financial sacrifices passive resistance would impose on the Commonwealth. Loss of revenue and increased expenditure could not be carried on indefinitely. If France did not give way or if no efficient help came from outside, Germany would have to yield. The English note of August 11, denouncing the French policy as unjust, remained without effect since it was not followed by diplomatic pressure. After more than six months of struggle, the German Government was obliged to call off the unequal conflict. Dr. Cuno chose to hand over the steering wheel of the storm-beaten ship to Dr. Stresemann who annulled the ordinances of his predecessor.

Claims Load Unbearable

MANY people abroad believe that the German policy toward the problem of reparations was altered by the passive resistance. This is not the case. From the very beginning Germany claims that the load put on her shoulders was not bearable and must be fixed equitably by a board of impartial experts. Soon after the invasion of the Ruhr on March eighteenth, President Ebert said in a public address in one of the mining cities on the border of the occupied territory: "So far the attempt to enslave this soil made sacred by labor and justice has proved unsuccessful, but as yet the French Government shows no desire to come to a free and just settlement to which Germany is and has always been ready to accede. It is our deep and firm conviction here that France's cry for reparations in a degree which she herself knows is impossible, is only a pretext to assure herself, if not of territorial, at least of such political and economic supremacy on the Rhine as she failed to obtain in the Treaty of Versailles. Secretary Lansing's book, among others, has made France's real object clear to the American people.

The truth of this statement is proved by two undeniable facts.

When Chancellor Stresemann declared that passive resistance must come to an end and invited the French Government to enter into a discussion of the situation, he met with blank refusal: France did not wish to change the régime established in the occupied territory; as to the Ruhr, she preferred to treat with the industrials instead of with the official authorities. For weeks the same conditions have continued and up to now there has been no sign of a general or final settlement restoring Germany's rights under the existing treaties.

Another proof is France's attitude toward the so-called Separatist movement on the Rhine and in the Bavarian Palatinate.

Soon after the beginning of the occupation, a few ambitious leaders, out of humor for various reasons with Prussia, began the agitation for an independent Rhine state. To name them would be to do them far more honor than they deserve. In spite of, and also because of, French money and support, the sturdy Rhinelanders refused to have anything to do with them, although there is no enthusiasm for Berlin as the center of the government. Self-government within the Empire would appeal to them, but they know that at present self-government could be obtained only by concessions to the French and would under these circumstances surely threaten the unity of the Empire. This is the unanimous and official standpoint of all the political parties in the Rhineland, the Social Democrats included.

The Separatist movement dragged along without serious incident and would probably have died out entirely if it had not received fresh impetus by developments in connection with the invasion of the Ruhr. The weakness of German authorities due to the expulsion of many and prominent officials, the lack of communication with the rest of the country and growing economic distress in consequence of the depreciation of the mark, gave new encouragement to the Separatists, who in the meantime had joined forces with the Communists who on principle always support any movement tending to undermine authority. The French saw here an opening for their old policy of dismemberment.

They would, of course, have preferred to co-operate with well-to-do and respectable citizens, but as the loyalty of the better class as well as of organized labor in the Rhineland was above reproach, they had to make use of the scum of the population to accomplish their ends. I want to quote the absolutely authentic statement of a French general to a prominent German official a few hours before the latter was expelled: "We should have preferred to work with Dr. X (a Conservative leader) or even with Z (a Socialist) but as we cannot, we must fall back on the canaille!" I can personally vouch for the truth of this cynical statement.

The Separatist Movement

THE methods of procedure are various. Money is spent lavishly, arms are distributed. Separatist bands enter a county seat, proclaim the Rhenish Republic, and the protection of French soldiers deprive the unarmed or disarmed inhabitants of any possibility of resistance. Especially Moroccan troops are used for this purpose. The so-called government of this "Rhenish Republic" consists of shady and mostly disreputable individuals. Its chief, a former Socialist editor, was sentenced not long ago to several months' imprisonment on the charge of calumny. The unfortunate population is ground between the millstones of military occupation and the brutalities of the Separatists.

England condemns the Separatist movement and its support by the French and Belgians most severely and has directed several notes of protest in very sharp terms to the High Commission in Coblenz, but evidently without avail, since France controls the High Commission and continues to aid the Separatists in every way.

England believes that every dismemberment of Germany would mean not only the end of reparations and of the Peace Treaty, but an essential change of the existing balance of powers on the European continent.

These are just a few scenes from the great tragedy in which the German people are involved, but now we must turn from poetic comparison to the sad prose of financial and economic conditions. I begin with the following statement: Since the end of the war, instead of recuperating Germany has been sinking gradually deeper and deeper into the mire from which she can never extricate herself by her own efforts and without outward help.

The revolution coming just when it did was a great misfortune and a real crime from the national standpoint. To a great extent the whole machinery of civic administration, renowned for its discipline and honesty, was hampered and interfered with; authority of every kind was undermined. The masses, physically weakened by years of trench life or undernourishment at home, were mentally poisoned by radical ideas and thus doubly unfit for the increased production so vitally necessary to re-establish the economic balance.

In such abnormal times many people shun real work and turn to profiteering; this is commonly called the "Jewish spirit" although not applicable to Jews alone. In connection with the fact that many of the radical leaders were Jews, it explains the strong anti-Semitic feeling prevailing in Germany today.

Nation's Wealth Fades

BUT the chief reasons for the present conditions, financial and economic, are beyond Germany's power to alter. The loss of valuable territory and material, the crushing load of reparations, were imposed by the Treaty of Versailles and the most competent economic authorities of all nations recognize that only a revision of the treaty can restore normal trade conditions in Europe and in America.

I cannot dwell here on details. One fact will demonstrate the situation. The sums which Germany must pay to foreign countries are much larger than her trade profits in these countries. No balance is possible until the reparations total has been fixed as a sum possible for Germany to pay.

As it is, Germany's national wealth decreases day by day and her condition may be compared to that of a business man whose expenses exceed his income, who has lost all credit and who is living on his capital. The result, of course, is fatal!

A country is not a business man. For a certain length of time it is able to maintain itself by different financial measures. Thus money and monetary conditions become, it is humiliating to admit, the most important factors in deciding the issue of the present crisis.

The inflation of currency or the printing of paper money revolves in a vicious circle. Payments exceeding

Lessons From Co-operative Movement in Europe

Concluded from page 2

that confront the movement as well as the successes. His guide will willingly start with the first. Does he wish to make a sudden descent into the innermost recesses of the jam or canned fruit factories to see whether conditions there are sanitary, he is accommodated immediately. In fact, the cards are laid on the table with a refreshing responsiveness that is delightful after the experiences the writer has had in investigating some types of business in our own country. It promotes good will and good understanding and prevents antagonism to business growing out of distrust.

In these days of buying on the installment plan and paying greatly increased prices for the opportunity, we can sit at the feet of the co-operatives and learn of the benefit and joy of buying with cash, for this great movement is based essentially on a cash basis. It means a daily lesson to the housewife in buying as you go, and its saving possibilities are often equal to the return one can obtain from an investment in our life insurance policies, at the end of the year. Unless there has been a business catastrophe, the "woman with the basket," steps up to the counter, as I saw her do in the Rochdale local co-operative, and gets her share of the dividends that have accrued from being able to buy with some five million other housewives in large quantities, through direct contact of her representatives with producer or manufacturer.

A School of Teaching, Too

FURTHERMORE, the co-operative movement is a school in teaching as well as practicing the essentials of representative democracy. When you ask the leaders of this movement what their life's philosophy is, they will insist that they are Christian Socialists. Whatever this may mean I am certain of one thing, that the hundreds of local co-operative organizations throughout the British Isles are administered by a representative form of government. The members are constantly holding meetings, electing their boards of directors, criticizing them, or praising them; taking lessons in co-operation, studying public questions of national importance, and instructing the representatives whom they select as to their wishes when these representatives gather at the national meetings to select the directors who shall guide the destinies of the great wholesale societies.

In this work, they are guided and assisted by the efforts of the Co-operative Union located in Holyoake House at Manchester. It serves and provides the teaching and propaganda part of the organization. It holds classes in the study of co-operation, sending speakers to the local societies, or helping them to develop their own teachers and speakers. It arranges summer schools, evening classes and other facilities for advancing the cause of co-operation.

I was shown in the propaganda section of the Union most excellent motion pictures of the work that the various departments of the great co-operative organizations are doing. These pictures are displayed at gatherings of the local organizations. In fact, this Co-operative Union is constantly spreading the gospel of the cause, lifting up the weak societies and answering the call of those who desire to start new ones. Large sums of money are contributed each year for charity purposes of a public nature which are not linked up with the movement as such.

And not the least in the educative branch is the woman's guild which emerged after many tribulations. It grew from the desire on the part of the "woman with the basket" to rise with her trade union husband. She is the "wage spender" of the "wage earner." Lack of space only prevents me from expanding this intensely interesting phase of the movement.

To an outside observer, while the success of women in the movement is not fully appreciated when representation on national boards and committees is desired, the male co-operator realizes that she is the backbone of the local organizations. The two great constructive pioneers of the woman's co-operative movement in England were Miss Llewelyn Davies, and Mrs. Cotterell, who have only recently retired. Through them, the women have been amalgamated into one great co-operative group or association composed of almost as many units as there are local co-operative organizations. They study co-operation, citizenship, public health and housing, health of school children, maternity problems, and bend their energies toward corrective laws in behalf of public welfare.

The movement has not taken any stand on the liquor question in politics, and when I pointed out to some of them that they seemed to me to be a direct and constant factor in this problem, in view of the fact that they did not permit the sale of any alcohol through or on the premises of their local stores, and were perfectly willing to have their stores compete with private stores that did sell liquor, they seemed surprised. I was not able to secure from their officers whom I consulted any direct statement as to why they did not allow liquor to be sold in their stores. Some members did say that they thought the absence of alcohol in their business was conducive to greater saving on the part of those who came to purchase and thus increased the investments of the members in the co-operative movement.

I have already intimated that the consumers' co-operative movement has been a factor in eliminating false advertising and the adulteration of goods. One Sunday morning, while in London, I dropped into St. Paul's Cathedral and was brought to attention by the young preacher when speaking on the truthfulness of John the Baptist. He stated that it was frequently said, and with how much truth he did not know, that "one cannot rise to the top and succeed in our business world except through misrepresentation and false branding of goods." Of course, there are many private stores of high type in the British Isles who would not stoop to such practices. I am sure, however, that no economic factor in the British markets has compelled the sale of pure foods and truthfully advertised fabrics as much as the co-operative movement that was started by the twenty-eight weavers at Rochdale.

The reason for this attitude of the consumers co-operative movement is obvious when we consider that the consumer is buying or manufacturing his own necessities. He would be stupid or unbalanced if he were to permit his employes or his representatives to fool him into manufacturing or purchasing the adulterated or the falsified article.

Don't Take to Advertising

AS WE passed through the jam and canned fruit factories, our guide called attention to the fact that while during the war, under government control, all manufacturers of jam were required to make a fruit content of a certain fixed per cent, since the return of private control, the co-operatives continued to make the same percentage. Some private concerns had gone, in some instances, far below after the restriction was taken off.

The British co-operatives do not take keenly to advertising except through the educational propaganda methods already mentioned, if indeed the latter can be called advertising. In Glasgow, however, we did see some large painted signs containing statements on the growth of co-operatives, and the manager of flourishing St. Cuthbert's Co-operative Association in Edinburgh, one of the most up-to-date of all the local societies, told us that this year for the first time his board of directors had allowed an item of £3,000 ($13,950) for newspaper advertising.

When I suggested to the wholesale department at Manchester that they might advertise in the press with profit the fact that they were carrying the same fruit content in their jams as was required during the war, they did not seem interested. It occurred to me that such a statement would be of value in drawing new members to the organization. Somehow, I gathered that there was a feeling among them that advertising such as we understand it and which has been so successful in building up American business would produce an artificial and too rapid growth rather than a permanent one.

Recently the co-operative movement decided to go into politics as a party in England, though this policy did not meet with the approval of all, for there are some who are opposed to the party idea. However, they elected four to Parliament. It is yet too early to say with what success its political action will meet.

Among the co-operatives, and particularly the enthusiasts, there are those who when asked whether they think the movement will eventually draw unto itself all classes and become practically universal in the empire, reply with an emphatic "Yes!" But there are others who are far more cautious.

Only Third Are Members

THOSE who believe in a near-at-hand universality of this economic movement in the British Isles cannot fully comprehend the difficulties that would confront them in handling size in their business and the ponderosity of men in the aggregate, nor do they give sufficient weight to the individualistic desires of people to spend their own money freely when the pressure of necessity is not driving them; nor to the desires of those of the human race who do not believe in or are not of a temperament that can make team-play dominate over individual whims.

The co-operative movement has been in practical effect for eighty years and yet, with all its marvelous growth and success, it has not attached to itself more than a third of those who live in the British Isles, and it has been confined almost wholly to one class.

The dream of some co-operatives is that it will eventually do away with all competition and substitute co-operation in buying, manufacturing and distributing. What it will probably do, will be to continue to serve as an inestimable benefit in the arena of competition as it has done in the past by compelling through its example and dominance those competitors who buy and sell for profit to deliver unadulterated goods. It will also through its facilities buy in quantities and by bringing the producer and manufacturer closer to the consumer, be able to net a dividend to the consumer and keep down the prices for the artisan. It will be a school for the teaching of representative government in a practical business way where those below may, through economic methods, learn how to keep open the door of opportunity with a stepping-stone upon which they may climb to greater prosperity and larger opportunity.

The consumers' co-operative movement with all its problems is one of the most portentous, successful and apparently enduring movements in this great period of world events. This was the impression that I got from my investigation.

As a last question to those who guided me through the consumers' co-operative world in England, I asked:

"What assistance do you want from the government in the movement?" and the reply was:

"We don't want any subsidy. We do want a free and fair opportunity to grow without hindrance from any source. Our motto shall be, 'God helps those who help themselves.'"

A Modern University in a Medieval Stronghold

Concluded from page 9

his temporalities to be seized and his person arrested, the bishop escaped to his castle at Durham, where he was perfectly safe. When the rebellion was suppressed. Bishop de St. Carilef was induced to stand trial in London and condemned to exile. He went to Normandy, where he was cordially received by his friend, Duke Robert; but he returned to Durham on his restoration to the bishopric five years later, bringing with him a shipload of rare books, church plate, vestments and ideas for the further building of cathedral and castle.

Owing to the dependence of the castle on the priory and the cathedral, the upkeep and extension of the castle suffered after Henry VIII's suppression of the monasteries. Later, during the tumultuous era of the struggle between Charles I and the Commonwealth. building operations fell further into abeyance, so that Bishop John Cosin, the first bishop after the Restoration, found the building in decay. Under Cromwell's régime the castle had been sold to a Lord Mayor of London, who had miserably defaced the buildings. Bishop Cosin spent large sums out of his temporal estate in rebuilding and repairing the castle.

Since the death in 1836 of the last Earl-Palatine. Bishop Van Mildert, the castle has been used for the purposes of Durham University and is occupied by members of the University College, the university having been founded by an Act of Parliament in July, 1832.

So we have here domiciled in a great medieval castle the youngest and in many respects the most modern of England's universities, as far as spirit and equipment go. The utilitarianism that so largely distinguishes the northern character certainly stands out in contrast to the more literary traditions of Oxford and Cambridge.

Lingering perpetuations of the association of the castle with the powers that be, lay and ecclesiastical, are found in the fact that a suite of rooms is reserved for the Judge of Assize when holding court in the county and he is entertained there. The Bishop of Durham also has his room with four-poster and canopied bed, as well as special dinner service of old silver and china. Visitors gaze on the oak carvings, paintings and archaic furniture with awe, especially when told that uneasy crowned heads have dotted Durham Castle's history by sleeping in these beds on rare occasions. In olden days, it was quite the thing for monarchs to be entertained at the castle on their journeys to and from Scotland and the North of England, a trip that in stagecoach days occupied ten days or two weeks, but which is now accomplished by express trains in six to seven hours.

The great hall is entered from the courtyard by a fine portico built by Bishop Cosin, which forms the principal entrance to the castle. It has a pointed arch with nookshafts in the jambs and is surmounted by carvings of Bishop Cosin's shield of arms with miter and crest. The hall itself goes back to the early Norman period, although subsequently altered at various times, Bishop Fox reducing its original length to gain space for a butlery and pantries. He also did away with the lower of the two regal seats and erected trumpeters' seats in the gallery. This noble apartment is now used as the dining hall of University College.

In Tunstall's Chapel one finds a reminder of the fact that Cardinal Wolsey, although he was never in Durham during the six years he held the bishopric, placed his family coat of arms on the dexter side of one of the shields bearing the arms of the see carved on the oak choir stalls.

A circular staircase between the Common Room and the Senate Room of the University formerly led from the lower to the upper dining hall, which was probably the hall of the Constable.

Some explanation of the term "County Palatine," which mystifies many Americans, may be appropriate.

There are three Counties Palatine in England: Durham, Lancaster and Cheshire. A palatinate is a territory throughout which the chief lord exercises certain royal rights and privileges known as *jura regalia*.

Among the *jura regalia*, or royal rights, which belonged to the palatinate of Durham, then, and the enjoyment and exercise of which were reserved by successive Bishops of Durham as "princes palatine," were:

(1) The right of having their own Courts of Chancery, Exchequer and Admiralty, as of holding common pleas and pleas of land, also a Court of Wards and Liveries.

(2) The right of appointing their own Chancellor, Justices, Sheriffs, Coroners, Escheators and other officers, within the Liberty of Durham, precisely as the Sovereign possessed these powers elsewhere in his realm.

(3) The right of issuing in their own names, writs, precepts and mandates, as of commissions to raise armed forces and levy subsidies and taxes.

(4) The right of coining money in their own mint at Durham.

(5) The right of declaring forfeitures and escheats of every description, whether for high treason or as ultimate heirs.

(6) The right to the "year, day and waste," and the right to pardon.

(7) The right to hold Councils in the nature of county parliaments. (No knights or burgesses were returned to the Parliament at Westminster for the County of Durham before the reign of Charles II.)

(8) The right of granting charters for free warren, markets, fairs, bridges, walls and roads.

(9) The right to create palatine barons by summoning their tenants to council and parliaments.

It will be seen that a County Palatine was a veritable *imperium in imperio*, a state within a state, and one with greater independent sovereignty even than that of the Irish Free State of today. This rule and sovereignty may be described as "theocratic" in origin and essence, much as was the ancient Hebrew monarchy. It was only on the death of Bishop Van Mildert, in 1836, that the last of these regal rights and powers were taken from the Bishops of Durham by Act of Parliament and vested in the Crown.

Spell-binding Agitators of Italy Lose Caste

Concluded from page 10

time later arose the idea of Italy as a sovereign state —"United Italy." Mazzini, Cavour, Garibaldi—they are the big names and their work finally found expression in a technically united Italy under King Victor Emmanuel II, in 1870.

But times have changed. Italy has no raw materials—she has no coal, iron, or oil, and it is on coal and iron that modern nations are built. The Italian peninsula consists mostly of mountains—the Apennines. In many parts the lowlands have been covered with lava from volcanic eruptions and nothing will grow. The mountains have been stripped of trees and there is nothing to catch the water for the land, which is fertile, and, since the sun is very hot and there is no rain for months at a time, crops are stunted. The farmers are diligent but they have little to work with—they have not the water. The population is increasing rapidly and there is not food enough for them. Everything is stunted; a Roman lamb is about the size of a fox terrier, a Roman chicken gives the impression of doing the best it can under a great sorrow. The southern Italians eat of their forty-two kinds of macaroni because it is the most filling stuff for the money.

The great palaces have mostly been abandoned by their owners, or if not they have been cut up into flats of all sorts, ranging from fine apartments to tenements. And into the great foundations of these palaces burrow little shops. But the net result of all this economic waste in the past is that Italy today has only a small purchasing power and is essentially mendicant. Having no coal or iron it seemed impossible to manufacture excepting articles which could be made by hand; today handwork stands no chance with machine work—few people can pay for the results of well-paid handwork while handwork in competition with machine work means starvation wages. Doing things in the good old way is all right if you do not care also to eat.

Germans Aided Industry

SO EACH year Italy has had to export her labor in human form instead of as finished goods—that is, she has had to send out yearly an average of more than a quarter million persons. Formerly they went to the United States, but now with the quota system in force only a small fraction of the people can get in. Nearly four hundred thousand wanted to emigrate to the United States this year. The war dammed up the emigration. With the United States shut off, the emigrants are heading for South America but not very willingly, for neither Brazil nor the Argentine offers many advantages.

Italy might have had a great working capital such as England has; instead her wealth is locked up in palaces and pictures—which are unproductive from the purely material point of view excepting for the income they bring through attracting tourists. Italy cannot pay by exports for the coal, iron, cotton, and wheat she needs—they fall about one-third short. This difference has been made up in the past by the tourist trade and the remittances from emigrants. A depression in the United States is felt instantly in Sicily and Calabria.

During the years before the war Germany started to develop Italy industrially and it is to the Germans that credit must be given for their present industry. In the north are now many fair-sized textile mills and silk is also extensively made, but the Italian silk is not as good as the Japanese. The cotton industry is the largest, but there is now a considerable metal industry, and the Fiat automobile works at Turin is among the largest in Europe, turning out some twenty-five thousand cars a year. Then there are a number of shipyards which make excellent ships at a low price, and finally a fair amount of scattered industry. I went over the new Fiat plant which employs now about thirteen thousand men and is built on the familiar all-glass construction style of the American factory; it contains a sizeable amount of automatic machinery and is among the most advanced factories in Europe.

The war took the German money out of Italy and now most of the factories are owned by Italians, but although a few are fairly large the majority are small —in chemical and textiles the average is only twenty employes to a factory, in cotton one hundred and twenty, in silk nine hundred, and in metal working seventeen. The little factories are just shops filling orders as they come in and they are idle about as much as they are working for they have to depend upon the home market; the big shops have to sell about two-thirds of their product abroad.

The home market is poor because through generations the surplus money went either into taxes for army upkeep or into buildings for show purposes. Never was there a better example than Italy of what high taxation will do. The Italian taxes now amount to about eighteen per cent of the national income as against eleven per cent in the United States; the farmers and working people are exempt from a great deal of the taxation—that is, they do not pay directly. The big burden on Italy is coal—coal is very expensive But if the mountains were reforested to hold the rainfall and big reservoirs were built, the whole country could not only have power through electricity but also have irrigation. The industrial North of Italy does run on electricity generated by water power and the country as a whole is next to Sweden in the use of white coal. But really to complete the program requires an immense capital. Instead of being allowed to accumulate capital the country has been the victim of as many harebrained schemes as our own Populist party ever thought up in its best days. A naturally gullible people has been played to the limit by all sorts and conditions of agitators. This is what Mussolini has stopped.

German People Still in Center of War Stage

Concluded from page 13

receipts, strangulated production, seizure of large quantities of paper marks in the occupied territory, lack of confidence of the outside world in Germany's power of recuperation under the circumstances, have forced the mark downward. Prices rise in consequence and salaries must be raised to buy the necessities of life. The printing of paper money in ever-increasing quantities is necessary to pay salaries. The printing itself inevitably causes inflation which in turn again reacts upon the value of the mark.

By degrees the mark has dropped to an incredible, almost astronomic figure, its relation to the dollar being one to one thousand billions instead of one to four as it used to be before the war! The inevitable result is the complete demoralization of Germany's economic life as well as that of the people in general as far as their economic relations are concerned. Saving is an impossibility. Money depreciates in your pocket long before it can be deposited in the savings bank or used for necessary purchases. Merchandise such as foodstuffs and other necessities is withheld from the markets until the prices become exorbitant. Even so, profits barely cover the cost of imports and the restocking with raw materials. Production becomes more and more problematic.

Famine and Anarchy Near

FAMINE and anarchy are on Germany's threshold. The German mark has practically ceased to exist. There are efforts made to replace it by a "Renten Mark" issued by a bank founded on real values. But these measures cannot possibly re-establish a proper currency without fundamental change in the above-mentioned conditions.

What is the result of all this?—A general state of unrest and fermentation throughout the whole country.

The curtain is raised again. Our grim tragedy is not without adventure and has even a touch of the grotesque!

There is a radical element fostered by Bolshevistic agitation and money, especially in the large cities and industrial centers.

Saxony and Thuringia have always been "Red" since the beginning of Socialism about two generations ago. The soil of these densely populated states is rather poor. One factory town follows the other and even the small villages are industrialized to a large extent. Years of privation have rendered people susceptible to the communistic gospel and the last elections returned a majority of radicals, who used their power to put their principles as far as possible into effect. Armed proletarian detachments were formed and the Red apostolate had made great progress when the Central Government interfered and re-established order on the ground of unconstitutional proceedings and of conspiracy with the Russian Bolshevists. Since then it has become known that the Prime Minister of Saxony, a former judge, had taken bribes from wealthy people already convicted who wanted to escape prison. Such a thing was utterly unheard of before the revolution, when the administration was carried on by carefully chosen experts.

The Hitler Movement

BAVARIA, owing to the difference of her social structure and to the drastic experiences of her Soviet period in 1918 and 1919, follows the opposite trend. In 1919 a kind of voluntary militia called "Einwohnerwehr" was formed as a non-partisan instrument of civic protection under the control of a moderate government; yet the Allies, on France's demand, declared it contrary to the rules of disarmament and enforced its dissolution. This happened in 1921 and proved to be a grave mistake also from the point of view of the Allies, the immediate result being the cropping up of various nationalistic formations and the birth of a new party, the National Socialists with a chiefly nationalistic program.

Adolf Hitler, the founder and leader of this party, a self-made artisan from a little place on the Austrian border, is undoubtedly one of the most striking features of the post-revolutionary period, one of those tribunes whom the world's history records as the sons of restless and chaotic times. His ideas are to crush Socialism as in opposition to nationalism, to punish the leaders of the German revolution and to fight the capitalistic system endowed with the Jewish spirit. This idealist's gravest faults are an absolute lack of real statesmanship and of moderation. Mussolini's success gave a strong impetus to Hitler's movement; only the German conditions are very different from the Italian, and Mussolini proved to be a man of sound political judgment. Hitler's deficiency proved indeed fatal in his last achievement.

While Bavarians, especially in Munich and the southern part of the country, are stout federalists and suspicious of everything which is connected with Berlin, Hitler resolved to establish [illegible] national and military dictatorship with the center in Berlin.

The cast: Kahr, Hitler, Ludendorff. Scene: the huge hall of the "Buergerbrauhaus," a [illegible] outskirts of the city, where in normal times [illegible] people are used to gather peacefully round the "stein" and listen to some popular band.

This whole performance was a real *coup de theater*, yet the situation is far from safe and the dangerous tension will remain as long as the outward political pressure and the economic crisis prevail, causing hysteria and despair.

Only international co-operation and a decided change in the attitude of France will restore normal conditions in Germany and will enable this country to face the problem of reparations. The Austrian example shows best what ought to be done with regard to Germany, though the German problem, of course, is infinitely more complicated.

But our problem lies deeper. Let us try to get at the bottom of it. Humanity is and must be organized in national states; there is no room for communistic dreams of internationalism. Only nationalism must be tempered by a deep sense of justice and solidarity as to human liberty and common interests. Humanity yearns toward such ideals. The League of Nations counts as a step in this direction, but in its present form it is not capable of solving problems of such magnitude. In an address before the American Academy of Political Science and Economy in May, 1923, at its meeting in Philadelphia, the following was said on this subject:

Need Christian Principles

"ANY progress will depend on the better application of sound moral or Christian principles. That there is so much talk and so little result of talk comes naturally from the lack of proper spirit within the nations. Material greed or imperialistic competition is the root of most wars. As long as the League is only a representation of governments, a reproduction of an existing combination of powers on the principle of mutual insurance, as long as it fails to represent the moral forces of this world, a higher level of the world's opinion, there is no hope of improvement. Yet there are individuals of highest standing among all nations. Why should not a court of such individuals be instituted to render decisions? Even such a contested question as that of the responsibility for the Great War could be solved by such a court, which would rally all those of good will. Of course, such a court would have to enter deeply into the matter; it should open the archives and trace the historical, social and technical evolution far back to the very roots of the gigantic catastrophe. This is just one example."

What we need most is common-sense idealism on the base of true Christian doctrine. We must realize that by helping another country in the family of nations we are not only performing a noble deed but one which is sure to benefit our own country in time. Both feet planted firmly on mother earth but with our gaze directed toward the stars; only thus can our times become the threshold of a happier future.

Hodge's "For All of Us" Proves Clean Plays Pay

Concluded from page 6

New York have been only moderately successful compared to what he is enjoying now. So it cannot be due altogether to personal friendliness for the actor and author.

What then is the answer? Is it because New York is surfeited with dirt and wishes to return to wholesome entertainment? The most blissful optimist could hardly believe that. It cannot be that Mr. Hodge is drawing prodigal sons and daughters to the box office because they have turned from smut to sanitation.

The play is presented in a Shubert theater under Shubert management. That would lead one to the thought that moral uplift of the drama is not involved in the commercial side of "For All of Us."

The explanation of the play's success cannot be found in any of these thoughts. The writer believes that it is due to some of the following causes. "For All of Us" is a success because Mr. Hodge on the stage seems to be a human being. He bears a traceable resemblance to men one sees every day in the streets. As Tom Griswald he is trying to help someone in trouble. He does it by the surest and most effective means, religious inspiration. Even the hardest-hearted cynic cannot but be impressed by the spectacle of some one turning from evildoing to good. The play appeals to elemental sympathies. No matter whether appeal is made artistically and skillfully or not, *it is made and responded to.*

It has a tinge of romance. The injured heroine, the lonely father, the youth in love, the moment of self-sacrifice, the triumph of virtue, and the punishment of crime are all in it. Everybody is happy at the fall of the last curtain. That is what matters most of all.

But underneath all these reasons—and they may be altogether wrong—is the fact that people as a whole are turning, groping dumbly, blindly but unmistakably, toward some spiritual solution for the troubles and temptations of human existence. The interest among agnostics over the controversy between Fundamentalists and Modernists is some proof of the truth of that. Anything is better than indifference to religion and the awakening of people to that fact has, to some degree at least, its outlet in the enjoyment that is brought to them by plays of the type of Mr. Hodge's.

That the hit made by the show will have any great effect on the general theatrical condition is more easily answered. It will not. As long as there is money to be made from stage filth, and without interference by the law, the theater will remain filthy. There are enough lovers of evil to make such presentations profitable. Producers as a class are like sheep. They follow a success as quickly and closely as they can with another of the same type. For that reason some of them will try to imitate Mr. Hodge's play; but from purely commercial motives. Some people will pay for cleanliness. Some will pay for dirt. Apparently both will continue to do so. But "For All of Us" will be a source of encouragement to some doubtful-minded writers and producers. What William Hodge has done someone else may also do.

CHRONICLER OF THE NEGLECTED TRUTH

Guggenheim Millions Seek Complete Control of American Farmers' Nitrate Resources

An Amazing Revelation of How Family That Dominates Copper Industry Is Reaching Out to Chile Fields to Take Over Fertilizer

By CHARLES ALBERT COLLMAN

THE seven Guggenheim brothers who for many years have occupied the world's dominant position in the copper smelting industry, are prepared to enter the Chilean nitrate field with a new process that promises to give them command also of this industry which is so vital to world agriculture and the manufacture of explosives. A recent announcement states that the Guggenheims are prepared to float their new enterprise on a huge commercial scale. The plan of these financiers cannot avoid exercising an important influence upon the economic life of the United States, which is dependent for nitrate upon Chile, that being the only country in the world in which nitrate deposits are found in workable quantities.

The United States is the greatest consumer of Chilean nitrate, although it has only a negligible part in its production. Chile, one of the richest mineral countries on the globe, is second only to this country in the world production of copper. But the chief of its natural resources is nitrate of soda, or saltpeter, which is now suddenly entering upon a new era of development, the fruits of which will be the creation of a situation as serious as it is remarkable.

The chain of events leading to this development was initiated thirteen years ago, when Louis Ross, a mining engineer, engaged in a search for extensive copper deposits on behalf of A. C. Burrage, a copper mining operator. He finally examined those in the Chuquicamata district of Chile, where he succeeded in obtaining options on immense deposits of low-grade ore. Mr. Burrage first offered these options to the Anaconda interests, then to Hayden, Stone & Company, but finally managed to put through a deal with the Guggenheims.

The acquisition of the great Chile Copper Company, whose annual output now approximates 196,500,000 pounds, added to the Guggenheims' dominion of the copper smelting industry. Other companies in their control include the Utah Copper Company, Nevada Consolidated Copper Company, Braden Copper Company, Kennecott Copper Company, Yukon Gold, and also a substantial interest in the Premier Mine in British Columbia. Their smelters dot the United States, Mexico and other countries, and their principal merchantable products are bar gold and silver, pig lead, electrolytic copper, sulphate of copper, nickel, arsenic, bismuth and platinum. The development of the Chile Copper Company was regarded as the acme of technical progress, although but few of the mining engineers and metallurgists who surmounted its problems reaped the rich financial rewards which attended the success of the project. The capitalists, however, profited hugely.

There was great surprise in mining circles when it became known in January a year ago, that the Guggenheims had sold control of the Chile Copper Company to the Anaconda Copper Mining Company, which had originally turned down Mr. Burrage's offer of the undeveloped property. The Guggenheims received $75,000,000 for the majority interest in Chile Copper. The Anaconda Company, in buying control, became responsible for the marketing of the Chile copper output. It was no less a surprise when it was revealed some months later that *the Guggenheims intended to put the millions obtained from the exploitation of the property into the Chilean nitrate industry.* These two financial developments are intimately related.

It may be that the Guggenheims felt it wise to invest their new millions in a Chilean enterprise rather than bring them to this country, where they would have been subject to heavy taxation. But as shall be seen, other and weightier reasons were taken into consideration in the first instance. To make these clearer, it will be advisable briefly to review present-day conditions in the Chilean nitrate field.

What Nitrate of Commerce Is

THE nitrate of commerce is a crystalline salt derived by leaching and precipitation mainly from bedded sedimentary rocks and gravels found in Northern Chile. The nitrate country is on the upland or "pampa" lying between the coast range to the west and the lower slopes of the Andes to the east. The deposits lie on the lower side of a westward sloping plain fifteen to one hundred miles from sea. Here there is neither rain nor vegetation. The altitude varies from 4,000 to 9,000 feet, but most of the nitrate works and mines are at 4,000 to 7,500 feet above sea level. The deposits are not continuous but extend in an irregular belt from five to forty miles wide, with barren intervals between. The amount of nitrate to be won per acre varies greatly from tract to tract.

These deposits, as food for plant life and raw material for chemicals and explosives, are one of the romances of modern industry and commerce. There are many theories as to their origin. One is that they are due to the decomposition of fish and seaweed in the ocean bed, which were raised to the surface by a cataclysm. Another theory is that nitric acid was formed in the course of ages from bacterial organisms. They mean much to Chile, for they enable the nation to buy abroad the bulk of the foreign products it needs and they provide more than one-half the revenues by which the government is carried on. They give work directly and indirectly to nearly half a million persons.

Nitrate lands are bought or leased from the government. The country is arid, and in some instances fresh water must be piped many miles from high mountains. Only one river crosses the pampa, and workmen, food supplies, fuel and all materials other than rock and sand must be brought from long distances. The world's demand for nitrate has led to the building up in this desolate region of considerable communities, with water, electric lights, railway service, motion picture shows, food supplies and fresh fruits.

The nitrate-bearing material, which is found above and below ground, and contains, in addition to sodium and potassium nitrates, soluble impurities in widely varying proportions, is called "caliche." What is known as the "Shanks" process is the one generally adopted in the treatment of caliche and the recovery of nitrate. The coarse crushed rock is treated by counter-current leaching, the aqueous solution being brought up in strength and temperature to boiling point, decanted, cooled, and returned for reuse.

The essential parts of the plant, or "maquina," are crushers, treatment tanks, clarifying tanks, cooling tanks and storage platform. From sixty to eighty-five per cent of the material which goes into the tanks is barren or waste. The recovery of nitrate in the caliche treated averages only about sixty-five per cent. In other words, the recovery is admittedly low, and enough is known to substantiate the statement that thirty-five per cent of the nitrate hauled to the crushers is now lost in process of treatment in much the larger number of plants. In spite of this fact, the profits of most of the large nitrate companies are enormous.

Has Done Much for Chile

THE average annual production of nitrate in Chile for the last ten years is 2,650,000 metric tons. The Chilean miner works hard and intelligently. The Chile copper, or Chuquicamata, and the Braden copper mines have made heavy drafts on the working forces of the republic. So far, industrial labor has been drawn from the farms, farm wages have more than doubled, and there is strong opposition from the landowners, who constitute the ruling class in Chile, to recruiting further for the nitrate fields in the farming districts.

From the proceeds of the nitrate tax, Chile has built ports, railways and permanent improvements, as well as contributed to the operating expenses of the government. Meanwhile, sources of revenue regularly relied upon by other governments have remained untapped. It would be possible for the Chilean government to abandon the nitrate tax, and in view of the attitude of the agricultural interests, and to further an industry on which so large a portion of the population depends, it is understood that the government contemplates the reduction of the export tax on nitrate and the placing of a similar tax on other industries. The export tax on nitrate is at present $10.46 a short ton. The nitrate beds are regarded as nearly inexhaustible, or at least able to meet the demands of the world for the next 100 or 200 years. Chileans have viewed with considerable uneasiness the methods adopted for the manufacture of synthetic nitrate, and they believe that the reduction of the export tax will remove much of the danger of competition with the chief of their natural resources.

It is the belief in mining circles that in the Chile copper deal, the Guggenheims at least outwitted the Anaconda interests. The result has been that considerable ill-feeling exists between the two large groups of copper financiers. During the pre-war period, Germany was the world's largest consumer of copper metal. The Guggenheims supplied most of this trade through German banking houses, and were intimately familiar with the details of this market. With Germany's defeat, at the close of the war there were large surplus stocks of copper on hand, and to dispose of these, the copper groups of the United States formed the Copper Export Association. It is believed that the Anaconda copper men made a miscalculation in their purchase of the Chile Copper Company, and that the Guggenheims, more familiar with the European copper situation, realized that Germany's recovery from her economic collapse would be delayed far longer than was generally supposed. The Anaconda interests now perceive that they have burdened themselves with a huge copper property whose large output will be found difficult to dispose of in a period where copper stocks are once more beginning to accumulate. The ill-feeling between the two groups was emphasized only a few weeks ago, when the Guggenheims dissociated themselves from the Copper Export Association, while the Anaconda decided to remain with that organization.

The explanation of the action of the Guggenheims in switching from the Chilean copper industry to the nitrate industry, is that, because of their better information, they knew that the Chilean export tax would probably be removed from nitrate and placed upon the country's copper output.

Both the Chilean Government and the producing companies are backers of the Association de Productores de Salitre de Chile, or the Nitrate Producers' Association, which includes all the producers except the two American companies that are in this field. The association acts as a general sales agent for its members, and fixes the prices for the trade f.a.s., or free alongside ships at Chilean nitrate ports.

While the United States is the largest buyer of nitrate, American firms produce but a very small part of the product, and not being members of the association, have no voice whatever in fixing the price at which they must buy the bulk of that which they in turn sell in the United States. The producers of Chilean nitrate, in naming the price at which they will offer their product, set the price at which American farmers and industrialists will get their fixed nitrogen from whatever source they draw. The two American companies operating in the nitrate field, the Du Pont Nitrate Company and W. R. Grace & Company, are not members of the association; they are prevented from joining it by the terms of the Sherman law relating to price fixing, which is an essential part of the functions of the association.

Chilean nitrates have been growing constantly in use in the United States and it is believed that they must be used in largely increased quantities in agriculture, and the manufacture of dyestuffs, glass and other products of the chemical industry. There are about 330,000,000 acres of land under cultivation in this country, most of which could take nitrates with advantage to the soil. The greatest consumption is looked for in the cotton-growing states of the Atlantic seaboard and of the Gulf of Mexico. Then it is expected they will be utilized in the Middle West and the Northwest, where the soil is poor in nitrogen.

Among the nitrate producers in Chile, profits have varied greatly from season to season and as between different properties. In a number of cases, dividends have amounted to more than 100 per cent. But it is inevitable that at a uniform price, some companies make large profits and others find it better to close down and sell their quotas. A study of five important British companies shows an average return of fifteen per cent on the reported capital, although the latter had been in part watered. Many British companies that have paid large dividends of forty per cent and more, had the advantage of rich lands bought early. In the nitrate year 1920-21, nine British companies, having a combined capital equal to $17,000,000, sold 600,000 tons of nitrate, with profits amounting to $6,500,000, being at the rate of nearly $11 a ton. From 1919 to 1923, the profits of the following English companies were: Liverpool, 140 per cent; London, twelve and one-half per cent; Pan de Azucar, fifteen per cent; Santiago, seven and one-half per cent; Santa Catalina, twenty per cent. The largest Chilean company, the Compañia de Salitre de Antofagasta, has made a *net annual profit* for the last twenty-one years of $1,700,000, corresponding to forty per cent on the average capitalization.

As a parent body, the Nitrate Producers Association has two foreign committees, of which there is one in London and another in Berlin. The association is represented in New York, as it is in other cities, aside from London and Berlin, by agents who observe and report conditions and do what is possible to stimulate the further use of nitrate. Nitrate production was originally established by Peruvians and partly financed by Belgians; later it came under British financial and Chilean political control. Still later, the Germans came into the industry as producers, and a small but increasingly active group of men born in what is now Jugo-Slavia, but long resident of Chile, made their influence felt. Chilean ownership has steadily increased.

Chilean companies now control more than two-thirds of the production. British capital is the second in importance and now amounts to twenty-five per cent. Of the eighteen directors of the Producers Association, three are British, three German, though representing companies now under Chilean law, and twelve are Chilean.

U. S. Report Criticized

SUCH is the complexion of the Nitrate Producers' Association of Chile, in which Americans are not represented, although this country is the largest market for nitrate, and American manufacturers and farmers are paying most of the above-mentioned huge profits.

To study ways and means of assuring commercial independence to American farmers and manufacturers in obtaining the essential nitrogen products largely produced abroad under monopoly control, Secretary Hoover obtained an appropriation from Congress, and last autumn sent to Chile two representatives of the Bureau of Mines to make a study of the situation there. These were H. Foster Bain, director of the bureau, and H. S. Mulliken, special agent. Their report, which has just been issued, has occasioned considerable criticism in chemical and mining circles, where it is asserted that while both men are representative mining engineers, they were not specialists in nitrate technology and should not have been called upon to pass judgment upon the purely technical question of nitrate treatment. Especially in view of the fact that Mr. Bain was making his first visit to Chile and had only a limited time in which to survey an industry of tremendous proportions.

The salient features of the report of Messrs. Bain and Mulliken, in Trade Information Bulletin No. 170,

Our Girls Are Growing— in Size and Strength

Study Made at Colleges for Thirty Years Reveals Exercise Has Done Much for Women

By CLELIA D. MOSHER, M. D.

Medical Advisor of Women at Stanford University, as reported by ANDREW R. BOONE

PROFESSOR CLELIA D. MOSHER,

Medical adviser of women at Stanford University, who, for 30 years, has been investigating in the field covered by the accompanying article.

THE college woman of 1893, with her large hips, small waist, flat chest and lack of vigor, is now only a memory, brought occasionally to mind by pictures we sometimes see hanging in out-of-the-way spots. Our girls of the present day are approaching the old Greek ideal for women; the normal woman is being developed. Improvement is noted each year. The impression given by the college girl of thirty years ago was one of weakness, while that of today's Greek type is one of power. Changing fashions in dress and increased physical exercise both in her younger days and in college are responsible for the growth of the average college woman which, by all indications, has not yet reached its limit.

During the last three decades, studies made at Stanford University, Smith College and Vassar College with women representing all sections of the United States and a fair proportion from foreign countries show the very definite increase in size. It is noted that the college girl is decreasing in age, though increasing in both height and weight.

Whether the same growth is true among girls who do not attend college is a question not yet satisfactorily answered. There certainly seems to be little reason why the same tendency should not be present in non-college women, since many causes appear to aid the modern girl in the development of her body. Municipal swimming pools, gymnasiums and Girl Scout activities have all become important links in the chain of development. Even with these things, however, it is an individual problem for both the college girl and the non-college woman (it being the former only who has been observed) as to the exercise she should take. Conditions vary with different girls and what is necessary for the preservation of one would be excessive and injurious for another.

Our girls of the colleges do not suffer from the lack of appetite so noticeable in the days of corsets, heavy clothing and conventional abstinence from exercise, which once was the sole pleasure of the males. The muscular tissue of women should be of as good quality as the muscular tissue of men. Such differences as are frequently found are due to differences in the use of muscles, brought about by conventional limitations of activity or dress. Marked overweight or marked underweight tends to lower the strength factor, as does also lack of co-ordination, which is too frequently found in women and exaggerated by their scant physical activity in childhood. The effects of muscular training persist long after the particular exercise has ceased. A high degree of muscular power in a woman in no way lessens her racial efficiency. Lack of muscular power may be a distinct racial disability.

Happily college girls are awake to the need of greater physical efficiency. The studies made at Stanford of 4,170 women students during the thirty years the institution has been in operation show at the time of admission not only an increase in weight, but also an increase of 1.2 inches in height. Vassar College statistics, gathered during thirty-seven years and based upon examination of 7,064 women, confirm the findings at Stanford, though at Vassar the height increase was found to be more than 1.5 inches. Measurements of 10,149 women at Smith College during twenty-two years also confirm the Stanford figures.

A consideration of the average height of college women either separately in terms of the individual college or university group or in terms of measurement of the 21,383 examinations at Stanford, Vassar and Smith combined, shows the same increase. It is a safe conclusion that college women have increased in average height 1.2 inches in thirty years, and that this probably is true of any college in the United States whose enrollment is made up of women not from one limited section, but from at least several states of different climates and conditions.

Careful study of the 4,170 women who entered Stanford during the last three decades shows that, while the range in height has remained practically the same (fourteen inches), the number of women in the upper end of the series has been increasing; or, while there are women coming to the university just as short in height as during the period 1893-1903, their number is decreasing, while at the same time the number of tall girls is increasing. True, not every woman has gained in height 1.2 inches, but an increasing number of women who are tall are entering the university.

It does not appear that immigration has affected women's growth to any degree whatsoever. Arguments against this possibility are several. The increase in height is found alike in one western college and two eastern colleges. There is a greater increase in the Vassar height than in the height of the Stanford women. Although the Smith record shows a somewhat smaller average increase, yet these records extend over twenty-two years, only a little more than the last two decades, and at both Stanford and Vassar the increase in average height is greater from the first to the second decade than from the second to the third.

Study of the birthplaces of the Stanford women shows that these women are a cross-section of the college women of the United States and not a local group. Every state, with the exception of North Carolina and Delaware, is represented, only about thirty-seven per cent being Californians. Pacific states lead in their representation at Stanford, but daughters from New England, the Atlantic states, the Central states and foreign-born are present in such a ratio as to show conclusively that the vigorous western type does not predominate and thus deduct from a fair conclusion.

The average height of California women is slightly greater than the height of others, something near two-tenths of an inch. But the inclusion of a greater number of Californians in later decades will not account for the increase in height to a much greater extent than did the girls of the Golden State.

That the girls from other Pacific states, the Mid-West, South and East, have shown a greater increase is indirect proof that exercise and more hygienic clothing are among the causes in developing this finer physical type of woman. Outdoor life with its tramping, climbing, riding and exercise of all sorts in the open was common to women to a much greater degree in California in the first decade than in Eastern United States. Certainly bicycling, which was one of the chief forms of athletics in the first of the three decades, was almost universal at Stanford, where limited means of transportation made it essential to everyday living during the pioneer days. Necessity for shorter, lighter and looser clothing came with the bicycle. It became imperative to discard the voluminous skirts which measured from nine to fifteen feet in diameter and weighed as much as seven pounds, and thus occasionally some venturesome college girl tried something new in the way of dress, which became the forerunner of the sport suit of today.

The change in conventional attitude toward woman's participation in physical activities has meant much to her, and is a vital contributing factor in the development of her body. Decrees of fashion have so altered her dress that it is now possible for the college girl to wear clothing which interferes less with her hygiene, and this, combined with development of physical training and sports in secondary schools and the changed attitude, helps to bring about the results noted.

It is common knowledge that the modern college girl is more active physically than her sister of a third century ago, but the Vassar studies have given us some exact knowledge on the subject. From 1896 to 1900, a little over one-fourth of entering students there had engaged in no form of sport before entering college, but in the next twenty years, only six-tenths of one per cent made this unfavorable report. This almost universal report of earlier activities has been fostered both by laws for compulsory physical training and by social advances in the line of municipal playgrounds and swimming pools. This desired development of women should in time extend to all classes, those who go to college and those who do not go, thus insuring better wives and mothers, and consequently a better race.

Fashion's influence has been a greater one than the casual observer would believe. Lighter and looser clothing arrived with use of the bicycle and the automobile and modern sports, such as tennis, golf, hockey, basketball and swimming, and fashion was forced to adapt itself

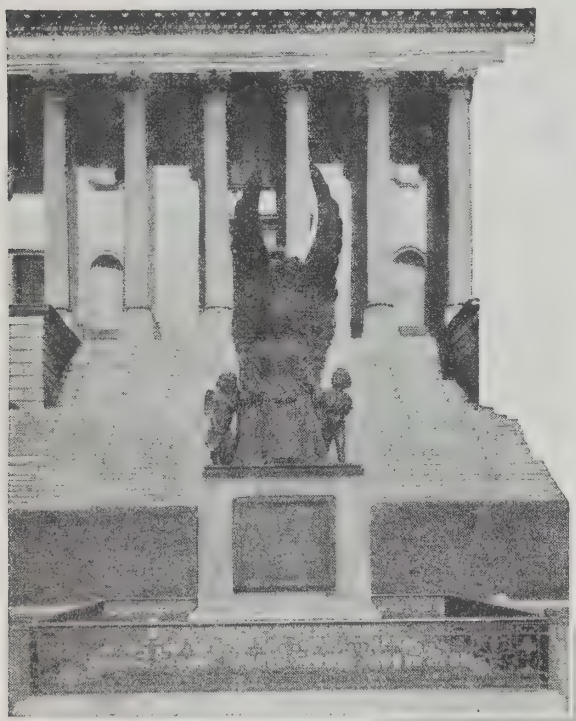
Left—American college girls indulge in outdoor sports more than they did 30 years ago. That is one reason they are growing. Here are shown two members of an archery class at Stanford University, keeping fit.

Right—Basketball has come to be a popular sport with college girls. Here is a bit of action in an inter-class game at Stanford University—another reason why the girls are growing.

This College a Training Camp for Statesmen

Twenty-two Alumni of South Carolina College Have Been Governors of the Palmetto State

By GEORGE H. DACY



This monument to the women of the Confederacy stands in front of the South Carolina State House.

Main street, looking north from the State House.

IF EVER the glory of a collegiate institution is measured by the accomplishments of her alumni, such is true of the University of South Carolina. No fewer than twenty-two graduates of the State College served as governors of the Palmetto State. It is a school that dates back to the dawn of the nineteenth century, an institution that was the first in the United States to advocate and sponsor self-financed education for students who aspired to higher learning but who were embarrassed in a money way. There is no other educational institution that has played a more important part in the formation of a state and the direction of its policies than the establishment which is the hub of scholastic affairs in South Carolina.

Shortly after the English settlers first established their colony in South Carolina, they mapped out a campaign of education. Early in the eighteenth century, the colonists passed measures for the founding of free schools and for the propagation of universal learning. They sowed the seeds which were tardy in maturing, due to lack of funds and the pressure of wilderness taming and Indian fighting. In 1723, the initial proposals were fathered by John Rutledge to establish a state college. Money was scarce and the carefully outlined plan, of necessity, was pigeonholed. In 1795, the first official action was taken by the legislature when it enacted laws to vest certain lands in what was then known as the district of Beaufort to build and endow a college.

South Carolina College came into being—the school with two teachers and forty-six students opened her doors January 10, 1805—largely through the efforts of Governor Drayton. His association with the college was prophetic of what was to follow, as ever since the inception of the institution it has been closely interlocked with the activities of the State House at Columbia, the capital of South Carolina and seat of the state university. In fact, the records show that the presidents of the college have always exerted a powerful political influence. The school has been a political training camp and the birthplace of ideas and ideals that have expanded into state and national policies. The Governor of South Carolina has always been the president of the Board of Trustees of the state school. Her interests have been his interests. The intimate relationship between the educational and political systems has reacted to the benefit of both. Statesmanship has ever felt the directing hand of educational progress. Education has advanced because it has had easy access to the money bags of one of the wealthiest states in the land of cotton.

The high brick walls which have encircled the beautiful campus of the South Carolina College, as the institution was first called, have been the sentries and outposts of history in the making for more than a century. They have seen the student body and the faculty decimated by civil warfare. They have seen the college buildings converted into a hospital for wounded soldiers and the abandonment of the curriculum because of a dearth of students. They have viewed destruction and construction, the burning of Columbia by General Sherman's army and the rearing of the existent city from those ashes and ruins. They have watched with horror the reign of the "carpetbaggers." They have witnessed the reclamation and restoration of the college to white control. They have seen South Carolina University emerge from eras of catastrophe and vicissitude into one of the leading schools of the South.

A chronicle of epochal student doings at South Carolina College would read like the memoirs of the Mexican Government, featuring alternate periods of peace and chaos, contentment and confusion. Three years after the first students flocked to the campus, the authorities had to face and conquer the dueling custom which intruded itself into the quiet of campus life. In a certain exchange of compliments via the pistol route, one student was killed and another seriously injured. That was before the days when the boxing ring or the wrestling mat was accepted as a satisfactory field of honor. When the students finally were dissuaded from pointing their small arms at each other in mortal combat, they took to shooting their pistols off on the campus in the dead of night. They stole the college bell, invaded neighboring churches and carried away their chimes, stoned a hated professor's house and burned him in effigy. John Barleycorn, although not a regularly enrolled student, was a frequent visitor at the campus. At one time more than one-half the student body had to be expelled simultaneously. It was under conditions like these that South Carolina College spent her early days. There were two "Wars of 1812." Uncle Sam fought one and the students of the college at Columbia the other, for that was the first year that they staged a student strike which for a time threatened the existence of their Alma Mater.

The First Baptist Church, in which the Secession Convention was held.

At the end of the first fifteen years, South Carolina College had one hundred students—sons of wealthy parents who had slaves for body servants and who dressed in the height of fashion of those days. While at college, they had to wear the regulation student uniform which was emblematic of the school during the first half-century of her history. The faculty had increased to five teachers and there were two dormitories and recitation halls, a commons, science and library building, observatory and homes for the professors. The state legislature was generous with appropriations and provided every facility for which the college authorities asked. At this time a boy named Eppes, a nephew of Thomas Jefferson, was a student. Jefferson frequently wrote to the president to ascertain the progress of his relative and to offer suggestions regarding the improvement of certain of the institution's educational topliners.

A decade later, General Lafayette visited Columbia and of their own volition the students organized a cadet company as a guard of honor for the famous Frenchman. The cadet corps was so popular that the organization was retained permanently for a number of years as a feature of the collegiate activities. About 1835, it cost the average student $350 a year to attend South Carolina College. At that time, the legislature passed a law making it a criminal offense to sell intoxicants of any kind to minor students, this being one of the earliest prohibition enforcement measures introduced on any American campus. A decade later, Daniel Webster visited Columbia and the students gave him the finest reception and torchlight procession ever accorded any guest of that interesting and unusual college town. Professor Louis Aggasiz, the famous naturalist, shortly thereafter entertained the students with a series of remarkable lectures. At that time the college owned a number of slaves who wore identification badges. If a student mistreated a slave in any way, he was summarily expelled from the school.

The boyhood home of Woodrow Wilson.

Previous to the Civil War, there was no opportunity for the poor boys of the South to gain the advantages of a higher education. Neither inducements nor facilities were offered for any except the sons of well-to-do parents to attend college. As early as 1851, the president of South Carolina College began to urge the state lawmakers to provide adequately for the education of young men of no bank account. His campaign bore fruit to the extent that several years later the state authorities passed measures which provided that one student from each judicial district in South Carolina should be educated free of cost annually at the state college. Five scholarships paying $1,600 were also established in 1858. These were the first steps taken in the entire South for the higher education of poor young men.

The state secession convention that was held at Columbia in 1860 was broken up by smallpox which also interrupted the commencement entertainments at the college. The murmurings of war were already heard and the cadet company, which had been disbanded after a serious student riot, was reorganized and engaged in daily drills. With the firing on Fort Sumter, a complete exodus of the student body occurred, 141 boys volunteering immediately for Confederate service. Subsequently, the college buildings were used as a hospital and on this account the Unionists spared the buildings when they burned the city, May 25, 1865. At the time of Lee's surrender, the Confederacy owed the South Carolina College $115,000 in rentals.

Uncle Sam used some of the buildings and college grounds as a military post and parade grounds during the twelve-year period following the war when he maintained Federal troops at Columbia, a city that had been a hotbed of secession and the proposed capital of the Confederacy in case Richmond was abandoned. During that period, South Carolina again resumed the education of Southern students which had been interrupted for five years. The only requirement for admission to the college was that the boy be at least fifteen years of age. The law and medical courses were added to the curriculum. In 1873, the faculty and student body left the campus when a Negro, who was the secretary of state, was admitted to the medical school. From 1873 to 1877, the college was in the hands of "carpetbaggers" and Negroes. Finally, the college grounds and buildings again passed into white control.

In 1878, the college was separated into two branches—the school at Columbia, and Claflin College which was established at Orangeburg, for training the colored race. The latter institution has enrolled more than 17,000 students from six states and 1,500 have been graduated. Twenty-eight trades and industries are taught there, the faculty now including sixty technical experts. The grounds and farm cover 140 acres and there are fifty buildings, many of which have been built by the students. The State College at Columbia was reorganized several times thereafter, legislative provision for the admission of women being consummated about thirty years ago. In 1906, the college was expanded and renamed the University of South Carolina. It is the nucleus of the state educational system which centers at Columbia, where there are now ten schools and colleges including two Negro institutions. There are two colleges for women.

The campus of the University of South Carolina

They Suffered Not Only at Valley Forge

Washington's Troops Spent Winters at Morristown in Misery; Skeleton of Army, Hungry and Diseased, Kept Foe at Bay

By JOHN D. ANDERSON

ONE of our first American chroniclers of events of the American Revolution told all about the hardships at Valley Forge; of patriot soldiers half clothed, wading through snow and over patches of ice with bare feet, leaving telltale bloodstains where they had walked in the performance of their duties as sentries.

Such writings have always stirred the patriotism of good Americans to the very core, but these tales did not tell the whole story, because they did not include the hardships of Arnold's earlier march into Canada; the awful suffering of the militia in Western Connecticut; the privations before Saratoga; the terrible experiences at Morristown and at many other locations in the Northern provinces. Patriots under the general command of George Washington at all of these places suffered as greatly as did the Valley Forge patriots. Indeed many of those who nearly perished, or actually made the supreme sacrifice because of cold and hunger, deserve our thought at this time, as much as those who suffered, bled and died at Valley Forge. The same soldiers who endured here could have testified as to the hardships which they had also suffered in Northern New England, New York and New Jersey. This was all due to the general sameness of the climate of this region, which formed such a great portion of the battle ground of this conflict and due also to the constant change of winter headquarters, which the war necessitated, caused in the main by the fact that the British army, with their Hessian allies, were greater in number and better equipped; that Washington was constantly having to outwit rather than outfight his opponents. No wonder Cornwallis was always referring to him as the Fox—but a fox which he never succeeded in capturing.

Above—The Ford House at Morristown, New Jersey, erected by Colonel Jacob Ford, Jr., in 1774 and is the house generally known as Washington's Morristown Headquarters, and stands next in interest to Mount Vernon. Below—Washington's Office in the Ford House, Headquarters from December, 1779, to June, 1780. It was at this desk in the corner that he penned many of his various letters to Congress, orders to generals, and prepared his famously accurate, painstaking accounts.

After Washington had won his splendid victory over the Hessians under Rahl at Trenton, Cornwallis seemed to have been in a state of wonderment and constantly consulted Howe at New York as to what course to follow. Washington's success at Trenton was no less startling than his next move, which was in capturing a large quantity of Cornwallis' supplies which by calculation he believed to be at Brunswick. In moving northward, he was forced into the skirmish at Princeton and there occurred the tragic death of General Mercer. Washington had escaped Cornwallis who only came to know of it by hearing the cannonading. He then started still farther northward with his army, captured British supplies and came to Morristown. Both armies were then exhausted.

This winter of 1776-7 was marked by no military engagements of more than local importance. Both armies were constantly sending out foraging parties. Washington's forces were continually in an almost starved state, without proper equipment, without proper arms, without uniforms, without proper training and many barefooted. What was occurring has been described as follows:

"We had a brush with the enemy; killed three light horsemen, four Highlanders, and one lieutenant colonel; the latter was killed by a six-pound shot. We had only two slightly wounded. The 'Locusts' have kept in since, they are not able to pay so dear for traveling so little a way."

By the tactics which Washington employed nearly the entire British army was driven out of the Jerseys. He had accomplished this by making it appear that he either was about to attack New York, or that he was going to attack Cornwallis near Perth Amboy. The British commanders were kept in constant ignorance as to his strength. As a matter of fact, he had a little more than a handful of men; not more than 2,000 then encamped in the vicinity of Morristown. He had not intended to make this location his permanent post but merely a halting place. ". . . . it was well situated for the system of petty warfare and induced him to remain there. It was protected by forests and rugged heights. All approach from the seaboard was rendered difficult and dangerous to a hostile force by a chain of sharp hills, extending from Pluckamin, by Boundbrook and Springfield to the vicinity of the Passaic River, while various defiles in the rear afforded safer retreats into a fertile and well-peopled region. It was nearly equidistant from Amboy, Newark and Brunswick, the principal posts of the enemy; so that any movement made from them could be met by a counter movement on his part; while the forays and skirmishes by which he might harass them would school their season in his own troops."

Washington's headquarters during the early part of the winter were at Freemason's Tavern on the north side of the village square; later at the Arnold house. His troops were encamped in the vicinity of the village, being sheltered at first only by tents but later log huts were built. The main location of these was near Bottle Hill and close by a sheltered, thickly wooded valley, with plenty of spring water near at hand.

Washington by some historians has been described as of a cold, distant, almost sullen temperament, but a better picture of him is the Washington who was genial; a gentleman always, possessed of decided opinions but never unwilling to listen to the suggestions of those associated with him in the conduct of the war. During this first encampment at Morristown, for we must keep in mind that we are now discussing that period, his three chief aids were General Knox, chief artillery officer, who was always happy in Washington's company; a brave, generous and genial officer, among the first three or four in ability in the Continental army; Greene, in whom Washington always displayed the greatest confidence and for the reason that this confidence was so well deserved; Sullivan, quick of temper but loyal and able. His military family consisted of his two aids: Colonels Meade, Tilghman, and a secretary, Colonel Robert H. Harrison, of Maryland; the "old secretary" so greatly beloved by Washington.

General Putnam had moved to Princeton from farther south with orders to keep a constant lookout for any maneuvers of the British or Hessians and be in position to form a junction with the forces at Morristown in case of attack.

Smallpox formed one of the great dangers in the army. It had broken out again, with the fear that it might spread throughout all the encampments. Its ravages were frightful and added much to the danger which surrounded Washington's scantily clothed, half-starved, discouraged army. In the latter part of February the situation of the American troops was deplorable. Washington wrote: "The cry of want of provisions comes to me from all quarters. General Maxwell writes word that his men are starving."

A little later Washington himself fell ill but fortunately his wife arrived and nursed him back to health. The Continental army at Morristown was composed of three thousand men, half too ill to fight and a great many suffering from smallpox. *It was the most desperate period in the history of the thirteen original states.* During May the situation improved.

Washington and his army again saw Morristown and made it his military headquarters from December, 1779, to June, 1780. This was in the Ford mansion, now owned by the Washington Association of New Jersey and commonly known as Washington's Morristown Headquarters. He was there with his military family as the guests of Theodosia Ford and during the six months of his stay a greater number of famous persons whose names are associated with the Revolution stopped under its roof than in any other dwelling in America. It stands equal to Mount Vernon in historic interest.

The Ford dwelling had been completed in 1774 and its owner, Colonel Jacob Ford, Jr., made a compact two years later, "to erect a powder mill, the making of gun powder, an article so essentially necessary at the present time." Congress loaned him two thousand pounds of the public money to be paid within a year "in good merchantable powder." Although Colonel Ford died in January, 1777, the powder mill rendered good service throughout the war. The mansion stands upon a small eminence, with a fine view of the hills back of it and contains treasures from the homes of hundreds of prominent New Jersey families.

During the early part of that winter, Washington and his family endured many hardships. Mrs. Ford and her family occupied the main portion of the dwelling. The kitchen of the house formed the living room and no fewer than eighteen of Washington's household—relatives, servants and members of his military family—congregated in this room quite regularly. This splendidly constructed building has been preserved in its colonial state.

After the death of Henry A. Ford in 1872, this property was purchased at an expense of $25,000 by a number of men who had for their object its preservation as a permanent memorial. The land at that time had a frontage of 253 feet and a depth of 545 feet; a little more than three acres. Later, additional land was purchased for $3,200. The building contains hundreds of relics of the Revolution. In addition to the articles of furniture used by Washington, and which were obtained with the house, is to be found the original commission of Washington as Commander-in-Chief of the Continental forces; the suit of clothes owned by Washington and worn by him on the day of his inauguration as President, together with a silver-hilted dress sword and buckles worn with it; a punch bowl presented by him to an ancestor of the Pride family and a pair of vases presented to General Lafayette, and the bust of Washington by Houdon and Peale's portrait of Washington; also many autograph letters of Washington.

Washington Irving says that while the encampment at Valley Forge "has become proverbial for its hardships, yet they were scarcely more severe than those suffered by Washington's Army during that winter. . . . for weeks at a time the army was on half allowances; sometimes without meat, sometimes without bread, sometimes without both. There was a scarcity, too, of clothing and blankets so that the poor soldiers were starving with cold as well as hunger."

The year 1780 opened upon a faminishing camp, for on January 8, Washington wrote: "The troops, both officers and men, have been almost perishing with want," and at about the same time he wrote Joseph Reed, president of the Supreme Executive Council of Pennsylvania, entreating aid for supplies and saying: "We have never experienced a like extremity at any period of the war."

A better idea of the hardships of Washington and his army at Morristown can be drawn from a winter visit than at any other season of the year, and a trip to his headquarters and a study of what he did there is certain to make a better American of anyone who will make the effort as well as to give an intimate knowledge of those "times which tried men's souls."

Real Vitality in Irish Co-operative Plans

Vigorous Growth, Stopped for Time, Does Not End Future of Movement

By HUSTON THOMPSON

ON THE advice of the heads of some of the great National Farmers Co-operative Organizations, located in Washington, I decided to visit Ireland first in the study of the farmers' co-operative societies. These gentlemen had been to Ireland in 1915 to study this movement and had returned filled with enthusiasm. They informed me that I would find there the "living spirit" of co-operation.

So I went by rail from Liverpool to Holyhead in Wales, and thence on a boat that cut the water like a rapier and moved with terrific speed to Kingston on Ireland's shores. I was made aware of the fact that I was in the domain of a separate government by having my effects inspected, my passport examined and my person searched carefully though in a kindly way for possible arms that might be concealed.

From Kingston to fascinating Dublin is but a short ride. There I was impressed with the results of the tremendous political upheavals that Ireland has passed through. As I rode about the streets in a jaunting car, I beheld the destroyed property which the Irish co-operatives said would total approximately several hundred million dollars. Superb public buildings, such as the Customs House, the Post Office, the Law Courts and in fact many of the finest buildings of the city, have been totally destroyed. On the other hand, in the country regions, according to my co-operative friends, over forty of their dairies—centers of their co-operative movement—had been burned to the ground.

To Escape Middleman

I POINTED out in my survey of the consumers' co-operative movement in Manchester, Glasgow and other points that it originated through the uprising of the artisan classes of the cities against the fearful pressure of trying to make both ends meet on a very small income. Side by side with the city movement and yet unrelated to it, and never fully accepted by it in the British Isles, there has been a co-operative struggle going on in the agricultural world for economic freedom and a chance to live.

If anything, this farmers' struggle has been against greater odds than the city movement. Why is it, I kept asking myself, that so many of the consumers' co-operatives of the city treat the farmers' efforts with indifference? In London, I queried one of the leaders of the consumers' movement, who is famed as an author on co-operation, as to the reason for the coldness.

"Oh!" said he, with a disparaging note in his voice, "These farmers' organizations are only pseudo-co-operative organizations. Their purpose is to make profits for the farmers and in doing so they are out to sell at the best price obtainable. On the other hand, the consumer of the city is not seeking profits. He is seeking to lessen expenses. And in doing so he is eliminating selfish competition. It is impossible to reconcile groups that are trying to sell at the highest price for selfish gain with such groups that are trying to buy at the cheapest price without any selfish motive."

"You have stated the case very strongly," I replied, "but until you can develop consumers' co-operatives among your farmers, an event which has not taken place thus far, and since it is evident that the city of today cannot exist successfully without the farmer being successful, are you not dealing with theory only? Why not, in the meanwhile at least, give the farmers' co-operative the full benefit of the purchasing power of the city co-operative as against his private competitors so long as he is willing to meet the competitors' price?"

But the question was left unanswered. In fact it failed to elicit a satisfactory answer in any of the countries where I found a similar indifference prevailing.

To escape from the toils of the middleman, the Irish farmers combined to find markets in which to sell. By the force of this combination, they expected to get a living price for their products and meet the competing commission merchant at least on an equality.

Can't Charge High Prices

KEEPING in mind the consumers' co-operative indictment of the farmer to the effect that, if he acquired a monopoly on a product, he would exact all he could from the city buyer, I put the problem up to Mr. James Adams, the director of the Ulster Organization Society in Belfast for a reply. His is the organization that has been created in the northern Irish country composed of the six counties of Ulster, for the purpose of teaching and building up co-operation in the North of Ireland.

"Will not the farmers' organizations ultimately get complete control of the dairying business of Ireland, and then charge exorbitant prices for their products?" I asked.

"They may get control," he replied, "and I hope that day will soon come, but they will never be able to charge exorbitant prices. The moment they do so in this free trade country of ours, Danish farmers who can reach our markets in twenty-four hours, and those of Holland and Belgium, who can cross the channel in much less time, will flood the market with their product and smash the price."

The farmers' organizations do not look with complacency on the efforts of the city consumers' organizations entering what the farmers consider their own field. Members of the farmers' organizations said something like this to me:

"We are farmers and we do not understand how to conduct business in the cities, and we do not think that the business men of the cities know how to conduct the business of the farmer. We believe that the consumers' organizations will fail when they attempt to go into farming, just as we would fail if we tried our hand at conducting commercial lines in the cities."

Apropos of this question, there is a consumers' co-operative society located in Belfast affiliated with the Scottish Co-operative Wholesale Society. This organization has gone into the dairying business on a large scale. It is a local society whose officers are live wires in the co-operative world. It has one great department store that compares favorably with any store in Belfast, and it has thirty retail branches strategically located over the city. In its financing it is entirely independent of the banks, since all of its money comes from its members. Its leaders are very proud of their success.

Although I called at a very early hour in the morning, I was given an immediate audience by the head of the organization. As soon as he learned of my desires, he placed me in the hands of an executive assistant. After showing me over the main store, I was taken to the outskirts of the city where they operate a dairy, which by all odds is the largest in Ireland. With special pride they showed me over the plant, pointing out great extensions and improvements they were putting in, and the new and up-to-date machinery that was being set up. When I suggested that there was possibly one link in the automatic machinery that was missing by which they could cap the filled milk bottles so that they would not come in contact with the hands, they stopped abruptly in the inspection and hurried me out into the yard. There they pointed out machinery that had just arrived from America which would do the very thing that I had suggested.

At Dublin, I asked Mr. Dolan, of the Irish Agricultural Wholesale Society, what one thing in his opinion had brought the farmer to the point where he was ready for the co-operative movement. His reply was:

"The Gombeen Man."

"And what is the Gombeen Man?" I inquired, thinking he might be something similar to the Goblin of my childhood days. And, as I found out, he was in fact a goblin to the Irish farmers, for the Gombeen Man was the one who lent them money. Seventy-five per cent of the Irish farmers, according to my informant, were born in debt and died in debt. The farmer found himself early in the hands of the money loaner who frequently was a merchant with whom the farmers had to trade and whose prices the farmer in his plight had to accept.

Sir Horace a Savior

IN THOSE dark hours, a savior of his people arose. It was Sir Horace Plunkett who, on returning to Ireland from a long stay on one of the farms in our Western states, initiated the movement which raised many Irish farmers from penury, distress, and suspicion of each other, to confidence in their neighbors and made them the recipients of the benefits of co-operation.

With the vision of a statesman, he formed a triumvirate, of which he was the leader, selecting as his associates, Mr. R. A. Anderson, an administrative genius and Father T. A. Finlay, a Jesuit priest in Dublin, who had studied the co-operative movement in Germany. To this group might well be added the name of the Irish writer, Mr. George W. Russell, whose brilliant pen has given the best exposition of the Irish co-operative movement that has been written.

These men traveled about the country, calling the farmers together and explaining the A B C of co-operation and the benefits that would come to those who took up this movement. I have it direct from Father Finlay's lips that it was not an easy task in getting a foothold, even where the economic pressure was so great. Not until Sir Horace had called and addressed over fifty meetings were they able to organize a single local co-operative association. But once the start was made, despite all the setbacks, the movement grew.

Today there are about twelve hundred local societies in Ireland, of which six hundred are banded together to buy through a wholesale co-operative organization. This wholesale organization, during the year 1918, had sales amounting to approximately $4,251,220.65. In 1922, the reports of the Irish Agricultural Organization Society show a membership of 152,194 members with fifteen hundred societies and a turnover of $48,409,073.

In expounding his views of the co-operative movement, Sir Horace Plunkett has compressed his conception of the cause into six words: "Better Farming," "Better Prices," "Better Living." To make it a living phrase, Sir Horace evolved what is known as the Irish Agricultural Organization Society, which guides and promotes all co-operative activities and audits the accounts of the many local associations.

Since the division of Ireland into the Irish Free State of the South, and the Ulster Government of the North, the Irish Free State Government contributes in place of the British Government which formerly contributed it. But none of these funds can be spent in the counties of the Ulster Government in the North. The result has been that the movement has, in addition to all of its other handicaps, been split in two and materially injured.

Now the co-operative movement in the Irish Free State is served by Plunkett House, and the Ulster by another organization headed by Mr. James Adams whose work is supported by the northern co-operatives and the Ulster Government.

One of the most notable and unique places in the city of Dublin is known as the Plunkett House, given and named in honor of Sir Horace Plunkett. We found there a large co-operative library and an organization equipped to awaken in the farmers the spirit of co-operation, teach them the administration of it and check the accounts of their local societies so they would know whether they were in the red or not.

The people at Plunkett House told us that the co-operative movement in earlier days had supplied the farmers with their crop needs as well as assisted them in the sale of their products. Because as consumers they bought in competition with the private traders they were boycotted by Irish traders until finally they went to England for their supplies. The boycott was such that they could not continue to supply the needs of the members and they yielded temporarily to the opposition of the private interests.

Then they developed their societies along the line of producing and selling. They met the lively competition of the dairy products in the English markets shipped there by the Danish Co-operatives. As they grew stronger, they again turned their attention to purchasing the needs of the farmers in wholesale quantities, such as fertilizer and seeds, and distributed them through their local societies.

One of the things that the farmers had particularly complained of was a trust that controlled the seed market. This monopoly made for higher prices and noxious weeds. Finally the worm turned, and the farmer began purchasing his own seeds. He instituted a plan whereby all seeds were tested both for purity and germination at a seed-testing institution at Zurich, Switzerland. Down came the price of seeds, and up went the purity percentage. In Donegal County alone, the price of seeds was reduced fifty per cent.

In Beautiful Donegal

DONEGAL County is said to be the wildest, most beautiful and loneliest of all Erin. As I reached the top of the divide that overlooks this county, there lay before me numerous farms of about ten acres each with its fields divided by numberless hedges, and treeless hills dotted with white cottages, having thatched roofs. The sun broke through the clouds that had been drenching the country with rain and I saw the ocean beyond. Try as I would I could not recall ever having beheld a more lonesome and yet in some ways more beautiful scene.

Here is located one of the most successful of the local societies that has weathered all political and economic storms. The hero of this society is one Patrick Galligher, who in the face of great opposition started a society with fourteen members in 1906 in a cabin on a local hill six miles from Dungloe. These farmers began selling tea, sugar, meal and flour to their members and kept the cabin open in the evening for those who wished to make purchases.

They soon forced the price of flour down from approximately $3 a hundred to $2.25 Then the local business interests got into action. They tried to outmaneuver this co-operative, by refusing to buy eggs from the farmers, as they had previously, who patronized this society. "Paddy" and his crowd immediately went into the egg business. Then the local traders played their strongest card by offering a higher price, just as is so frequently done by monopolistic groups in America. Once more the co-operatives turned what looked like defeat into victory.

Instead of having the farmers deliver the eggs to them as the farmers had done to the free traders, the co-operatives sent around to their homes and collected the eggs, thus saving the farmer a trip to town. Soon the fund which the local traders had collected for fighting this movement was exhausted and they faded out from the picture. "Paddy's" idea of defense was a rapid offense. He kept it up and today despite all the vicissitudes of that country it has one of the strongest local organizations in Ireland.

Real Vitality Is Seen

IN 1904 his turnover was $2,250. In 1915, it was $108,000. His organization was able to supply the farmers with practically anything they wanted, from fertilizer to clothes. The society will take the farmer's money and pay him five per cent interest. It sells his eggs for him. It has built a glove factory in which many of the girls of the surrounding country are employed. It runs bakeries with two branches and it has about put the "Gombeen" Man out of existence.

It has even gone so far as to purchase and navigate boats with which the farmers' products can be carried to distant points.

The farmers were frank enough to say that the farm organizations of Ireland would never succeed until they did all their own banking and were independent of private banks. They called my attention to a very interesting phase of the state of credit societies which had been established through the country by the co-operatives. Most of these societies were in a state of eclipse due to the fact that when prices were high after the war period, the farmers did not have recourse to them. I learned that only when the farmer is hard-pressed does he seek the aid of the credit societies.

While the composite impression left upon me was that the farmers' organizations of Ireland had passed through a period of encouraging expansion and growth, followed by one of great depression which was then upon them, there was still a real vitality in the movement

(Concluded on page 14)

Mr. Ford's Page

EVERYBODY makes mistakes, and President Coolidge made one when he pledged himself—if indeed it was a pledge—to saddle himself with the political inheritance that fell to him from the preceding administration. It was under the stress of the emotion of the moment, and doubtless with a desire to assure the country that no drastic "new broom" methods would be adopted, that he expressed his desire to work along the lines laid down by President Harding and with the men whom Mr. Harding had called to his Cabinet.

But nothing is more difficult than to pledge definite administrative action without a knowledge of all the circumstances that might arise. Mr. Roosevelt, in similar case, pledged himself to carry out the policies of William McKinley, but Mr. McKinley, could he have returned to this scene for a casual glance about, would have had the utmost difficulty in identifying his policies after they had been given the Rooseveltian touch. Likewise Mr. Taft, in a moment of gratitude to Mr. Roosevelt for forcibly inducting him into the Presidency, pledged himself to carry out the Roosevelt policies, but the cartoonists were soon picturing the Roosevelt policies being "carried out" as corpses.

IT IS the unexpected that provides the higher tests in politics. Steering committees do not foresee them; they break forth in their own way, at their own time, and there they stand as the Bar before which official character and ability are tested. No President has been able to choose his own tests. Lincoln did not. McKinley did not. Wilson did not. And now President Coolidge faces the Unexpected drawn up across his Presidential path. It is awkward; it interrupts work; it bristles with dangers; it is unpleasant—but—this always describes the Higher Test. If it had not these disagreeable qualities, it would not be that Test. Mr. Coolidge must now divest himself of all duties save his duty to the nation, of all characters save his character as Chief Magistrate, and of all hope of reward save the reward of brave, impartial performance.

The unexpected has occurred to President Coolidge very early in his administration, just as the unexpected occurred to Mr. Wilson. With Mr. Wilson the unexpected continued until the end of his second term. However successful Mr. Coolidge may be in disposing of the challenge that has arisen it may probably become an interruption and delay a little his constructive program.

But when the whole situation is canvassed, as thoughtful citizens are bound to canvass it, there will clearly appear this fact: A large part of any President's work succeeding a war must be the putting in order of badly disorganized functions. With all due respect to Mr. Harding, this work was not progressing favorably, readjustment had not gone far, when he laid down his office. Something aged Mr. Harding very suddenly and rapidly. Something took the smile from his face and the buoyancy from his heart, and it is not a matter of doubt that a large factor in this was his growing knowledge of the gigantic disorder which it was his duty to untangle.

It was part of the confidence of those who knew Mr. Harding (and perhaps it was a confidence that would have been wholly justified had time been granted him) that when he saw what lay before him, he would not compromise with evil or corruption in any form. He had called certain men to his side whom he felt he could trust. In certain cases he learned that his trust was cruelly abused. He died before he knew the full extent to which his confidence had been misplaced, but he saw enough to bow him down. Never an administrator in a large way, the huge bulk of the responsible duties of his office loomed before him as a crushing weight, but, as has been said on this page before, he showed at least the makings of an administrator because when he knew not what to do he wisely did nothing. There is a sense in which it was a mercy to Mr. Harding that the full extent of the failure of his plans and of his choice of helpers was veiled from him.

All this, part of which may have been known to Mr. Coolidge, was an inheritance for the new President to cope with. It was a most unhappy inheritance, and one which will test the spirit and the ability of President Coolidge to the utmost. It imposes upon him a task of such huge proportions that it is distinctly antagonistic to the welfare of the country to hope, for any reason whatsoever, anything less than that he shall be entirely successful in disposing of it. Any man who for partisan reasons wishes to heckle the President in his task, is not worthy of membership in any party. And no party can reap glory from the fact that it has made it difficult or impossible for a President of the United States to fulfill his task.

The nation at large as well as the elements of the situation fully absolve President Coolidge from any duty he may have thought he owed to his former chief's personal assistants. If he believed it to be the spirit and intention of Mr. Harding to do his duty, let the partisan consequences be what they might, it is sufficient for the country that Mr. Coolidge be loyal to that spirit and intention by making it his own. That it is his own no one can doubt; if it is not, his administration will prove to be not the wholesome facing of duty which has been expected of him.

This is not to join in the hue and cry for heads, for spectacular methods without regard to justice or constructive results; but it is to say that it has suddenly become apparent that here, and not in other matters, is the test of the new President. The people expect him to meet that test, and to do it without the slightest reference, or even the appearance of reference, to partisan ends or consequences.

President Coolidge must clean house, not only in those instances where neglect of duty and even personal moral weakness are plainly evident, but elsewhere. That is not always worst in an administration which comes to the surface. Men of great shrewdness accomplish with the minimum of risk many things which are detrimental to the nation. The counsel of some men is worse than the acts of others. What some men are able to prevent is worse than what other men are able to do. And no party is free from them, few administrations are free from them. The President of the United States has no partisan duties, he has no oath registered in heaven with reference to a party or a group of men. His duties are toward the nation and his oath is with reference to the nation alone.

In the present instance the President must not be swerved in any way by the actions or attitudes of Congress where, in the very nature of the case, partisan interests may have freer play. It is sadly true sometimes that certain Congressional attitudes beget certain Presidential reactions. The country is looking for something better than that from Mr. Coolidge. It is expecting that he will live fully in his character as Chief Magistrate and let the ephemeral things of the day die with the day.

What has been wanting in Washington for a long time is a chief director of the nation's business. It is sometimes easier to succumb to the lure of a man-hunt than to construct a fool-proof and thief-proof system of public business. The present situation is one which could very easily be handled by a seeming sacrifice of persons—the public would probably be satisfied with that, for all too often the public does not know the real inwardness of the fault. But President Coolidge will not let himself down to that level. He knows how deep the sore is, and how deeply it must be probed before healing can be expected. The country looks to him to use the probe. Whether that loses or wins him the election, a stern fulfillment of his duty according to his own high light will win him a name which will be worth many victories at the polls.

In private business, when things go wrong, the responsible chief does not excuse himself by blaming subordinates, nor does he persuade himself that the case is met when faulty men are penalized; a responsible chief never is satisfied after revelation of fault until he has gone down into the situation personally with a view to improving conditions in such measure as to prevent recurrence. That is constructive work. That is the kind of work for which a man like Mr. Coolidge would seem to be fitted.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Race Explains It

THAT the propaganda of Bolshevism is physically present in our country, there can be no doubt. It is also spiritually present in a certain alien type of mind. To this extent the chiefs of police are right who suspect Bolshevist propaganda in Lenin memorial meetings. But that Bolshevism can capture and subjugate the American mind is a conclusion not warranted by any facts now at hand.

The vital element in the problem is ignored in most of the deductions and analogies made, and that is the element of race. Thus far only one race has succumbed to Bolshevism, and that is the Jewish race. The Russian race has not succumbed; the Germans have simply refused to "take" the contagion; Hungary speedily threw off an invasion which was entirely Jewish. Were it not for the unique passivity of the Russian peasantry, Bolshevism would be an outlaw in every country, with a home in none; but Russian passivity allows it a temporary home in Russia, though, as every Russian will tell you, Bolshevism is not Russian at all, but Jewish. Racial in its origin, it requires kindred racial qualities before a rootage can be gained outside that race.

The conservatives of England are therefore quite out of harmony with the facts when they draw an analogy between Ramsay Macdonald and Kerensky. It is now known that Kerensky, as a comparatively mild social reformer, was allowed to reign a little while as the advance guard of ruthless Jewish Bolshevism, and that his "social democracy" was set up as a blind under which the Red Terror could advance. That is proved fact. But to say that Ramsay Macdonald and his Labor Government are set up as a "blind" for a revolution in England is to miss all sorts of pertinent elements in the problem. In the first place, Macdonald is British, as the Bolshevik party was never Russian. In the second place, Macdonald and his people love their land, as the Bolsheviks never loved (hated, they rather did) Russia. In the third place, the Labor movement is of the masses of the people, as Bolshevism never was—Bolshevism being really the conquest of the people by a small tyrannical group. And, most important of all, the Ramsay Macdonald group is not Jewish in origin, membership, principle or method. There is no analogy between the two cases.

But many people will continue to blunder through these matters for a long time to come, simply because they will refuse to see and reckon with the all-determining racial element. And there are enough flabby-minded sophists to preach how terrible it is to recognize this determining fact—this natural fact of race.

A Gentleman's Burial

THE glory of the world was in his death despised by Woodrow Wilson. He had seen it in its height and depth and hollowness. Raised higher than any other figure during lifetime, hailed as savior, he was hurled down to the depths of disesteem a few months later and called traitor to humanity. There is no reason to believe that either the elevation or the fall made much difference to him: he was not elated by the glory, nor disheartened by the disapproval: he had measured the worth of both before he had tasted either extreme.

His funeral arrangements were doubtless the expression of his own wish. Everything possible was done to shut the public out. Mr. Wilson himself would have shut it still more tightly out, may indeed have requested that it be done, but certain official formalities were inseparable from the occasion. At any rate, Woodrow Wilson acted the gentleman in his death; there was no exposure of the physical shell in which his spirit functioned, no sonorous oratory setting forth his life and works; a family party followed him to the tomb, and there, with even the President of the United States withdrawn, only the family saw him pass forever from the sight of men.

It was all decidedly restful after the long sad week the nation endured last summer. And welcome, too, was the absence of sob-writing in the press. It wrecked the nerves of the best sob-writers during that week last summer, when Warren G. Harding's body was carried across the continent, to portray each day "a nation prostrate in grief," "a nation bowed in anguish," and all the other stock phrases which, whether fitting the occasion or not, become sheer fustian at last. The fact of death in public life seems very difficult for the press associations to handle. Their difficulty almost equals the embarrassment of the deceased's opponents who had often called him a liar and worse, and who are now supposed to say that he was a great man and a patriot. Our politics are so small that they beget a sense of shame at funerals. Several gentlemen must have been very grateful for the sudden "indispositions" which prevented them from standing respectfully as near to Wilson's bier as the Wilson family would permit—which, quite properly, was not too near.

Wilson, even in his mistakes, even in his futile ideals, was a greater personality, will be a greater figure in the national remembrance, than all his opponents. If his body remains permanently in Washington Cathedral, it will be the beginning of an American Westminster Abbey, where only the great and noble shall be interred.

Who's Anarchist Now?

IN A famous lawsuit a jury of American citizens rebuked the Chicago *Tribune* for its promiscuous use of the term "anarchist." It had seen fit to turn its journalistic guns, loaded with editorial venom, on a private citizen, as it had turned them on multitudes of private citizens before. For once, however, private citizens found a champion and the *Tribune* ate crow.

As a new development in its curious mania, the *Tribune* has turned anarchist itself and is so charged throughout the land. The *Tribune,* "breathing out threatenings and slaughter" against all and sundry, from Mexico to Volstead, and failing in the least to impress its own city of Chicago, has at last turned its attack against officials who would enforce the prohibition law.

The *Tribune* has had a bad run. Though it modestly styles itself the "W. G. N.," the World's Greatest Newspaper, its whole record during the past twelve years indicates that its truer title would be the W. P. G., the World's Poorest Guesser. It has guessed wrong on every big subject it has touched. Editorially it is the World's Perpetual Grouch. But its open shameless stand against the law and in defiance of the Constitution is rather startling.

That the reader may be judge, these sentences are quoted from a *Tribune* editorial: (the italics are ours)

"Prohibition is a dictation of one state to another, of one community to another, of one individual to another, and the sections dictated to rebel. What is to be done about it? For one thing the Federal Government can cease trying to enforce the law . . . .It can cease making appropriations for the official rum terriers . . . . *The prohibition amendment will remain in the Constitution.* Many generations will find it there, *but it can be annulled where it is not wanted.*

"Mr. Dever and his 7,000 policemen are endeavoring to make a city, which is at least five to one convinced of the unjustness of prohibition law, subscribe to it, accept it and obey it . . . .As an Irishman he must know it cannot be done. He has a non-enforceable law on his hands . . . . If he had any political ambitions he has sacrificed them. If Chicago had a recall law he might be recalled next month . . . . The city will elude the enforcement . . . . People resent oppression . . . ." (and so on, with evident intention to emphasize that this is "the Irish view of it," which the Irish in America will be quick to deny.)

For shameless threatening of an officer who was barely attempting to do his duty, there is nothing in American journalism, outside rebellion, secession and Sovietism, to equal these ravings.

The Chicago *Tribune* is no longer, if it ever was, the World's Greatest Newspaper. It is now not even Chicago's greatest newspaper. It has laid itself open to public desertion. Let it go a little further, and the padlock law will apply to its editorial offices.

How Industry May Serve the City

THE financial exigencies of municipalities in the United States are forcing them into a new program of public service. At present it is the custom of cities to duplicate at enormous initial cost and interest payment the various types of public service required which could just as well be performed by private concerns now existing. There is no need for any city of size to go into the power business, because every industrial center has enough privately generated power to carry on all the cities' activities and to spare.

What is an industrial community? It is first of all and fundamentally a power generator. It doesn't matter for what object the power is used—motors, medicines, shoes, clothing, furniture, food—it is all at bottom a question of power. Count up the hundreds of thousands of horse power which one city will generate. Multiply this by the cities of the country, and it will be evident at once that, so far from cities needing to go into the power business, they have only to hook themselves in with power already at hand.

Take the matter of street lighting and transportation. Street lights are used when most of the factories are closed. Modern factories have facilities to furnish the city with power for lighting: light is but one product of power. It is simply a matter of switching into municipal service the power that is not being used in industrial service.

In transportation the same principle applies. The peak loads of city street railways come when the factories are empty; that is, the peak loads of the street railways come when the peak loads of the factories fall. The heaviest pull on transportation power always comes when men are going to or coming from work, on Sundays and holidays, that is, at times when the factories are inoperative. Economical management could easily contrive to have the factory power plants start earlier in the morning and help move the crowds coming to work, and work longer in the evening to supply power to carry the crowds home. It is a matter of using what already is at hand, and hooking it in where it is needed.

The idea of making the local industrial organization a municipal reserve has hardly penetrated managerial minds as yet. When it does so penetrate, we are going to see less duplication in the form of vast municipal plants. The fuel problem of cities could be greatly eased by an alliance between the industries and the fuel suppliers. Industrial centers consume mountains of coal which, if coked, could supply mountains of fuel to the citizens. But here, as elsewhere, is the old waste of duplication: industry burns coal raw; domestic consumers require an entirely additional supply, and they also burn their coal raw. Whereas, if the coal used in industry were used only to the extent that industry requires, and the residue retained for purposes of domestic heating, a city's coal supply would become a source of saving and certainty instead of an almost unbearable burden of express and mental distress. Coal can be burned twice, to the advantage of both users. And then, besides, there is gas for the city, and various compounds for the technical industries.

Our municipal life is wholly unorganized. Attempts at organization thus far made have proceeded on the theory that the municipality should somehow be distinct and independent of the factors which make up the municipality. If there is anything vitally connected with all that concerns the municipality, it is the industrial potencies therein found. These potencies should be enlisted in the public service. When they are, the problems of lighting, transportation, gas and fuel supply, will be near solution.

In the matter of Secretary Denby, President Coolidge has justified the expressed opinion of many people that he would not be hurried into any act which could be construed as hasty or unjust. The Senate had a right to express its opinion as to the desirability of Secretary Denby continuing in the Cabinet, but the President has an equal right to defend the prerogatives of his office against Senate usurpation. Mr. Denby insists that he would do the same thing again with reference to the oil leases, which at least shows a clear conscience, whatever it may indicate with regard to his business judgment. The fact that there are two sets of facts, one on which Mr. Denby claims to have acted, and one on which the investigation committee is proceeding, would seem to leave open the question of culpability until the status of those sets of facts is settled.

Putting Americanism Into Our Fiction

Picture of Our Country's Yesterdays Can Best Be Put Into Novels, Says Sophie Kerr

By FRED L. HOLMES

SOPHIE KERR

THE historical novel is returning to favor. What James Lane Allen did to recapture the life and manners of Kentucky; what Herbert Quick accomplished for Iowa in "Vandemark's Folly," and Emerson Hough for the Far West with "The Covered Wagon," Sophie Kerr has now done for the eastern shore of Maryland with her novels, "Painted Meadows" and "One Thing Is Certain." The eastern peninsula of Maryland, separated from the larger acreages by Chesapeake Bay, has a distinctive individuality. Its farms, with their quaint names, inclosed with snake rail fences; its fruit orchards and vines growing luxuriant harvests; its undulating meadows and rich productive farms; its little oyster beds in coves along the bay shore and its communities isolated from the railroads, have made it a land where men and women were reared with an individualistic American personality. They are a law-abiding, a home-loving people, with a flavor all their own. To capture the manners and customs of this Maryland life, rich in color, dominated with its great passions, has been the dream which is now wrought into a reality by Sophie Kerr through two novels.

"The picture of America's yesterdays can best be preserved in our novels," declared Sophie Kerr with emphasis. "In recent fiction, like 'The Covered Wagon' and 'Vandemark's Folly,' there is a portrayal of life of a few short generations ago for the people to see, to revere and to remember—for it has already changed and gone. Such books are valuable to literature; they make a record of early America that is at once true, and principally appealing.

"Sugary romantic novels about colonial life are boring and untrue. The new 'historical novel' goes no further back than our grandparents, but is of compelling interest, for its writers have grasped the vital point that they must tell a good story as well as present good history."

When this interview was given, the author of the novels about the people of Eastern Maryland was sitting on a tapestried divan in one of the college reception rooms of a Mid-Western city. She had been reading some of her stories to a convention of journalistic classes. From the long hall there floated in snatches of conversation from groups of eager girls enthusiastic over their prospects in life. It was a rollicking, a jubilant, an exulting chatter of mingled voices. Although Sophie Kerr has declined to become a lecturer, she has accepted several invitations to appear before chapters of Theta Sigma Phi, the only woman's journalistic fraternity, of which she is an honorary member.

Why Leave It to Drinkwater?

OVER in the corner of the room, where we visited, stood a long bookcase.

"Think of the work of Scott and Dumas," she continued, pointing to the shelves laden with volumes. "Most of us have learned the greater part of the history of England and France which we know from their novels."

There was a pause as if the author were framing a bombshell. It came.

"Why leave it for John Drinkwater of England to dramatize for us the life of Lincoln, or the career of Robert E. Lee," came a sentence like a blast of fire. "They are good plays—admirable. I think the Lincoln drama is better than the one on Robert E. Lee. Both are sympathetic, and understanding, far more than we might expect. But why should we leave it for others than Americans to write about America?"

"Don't you think the people of the United States are proud of their language and their literature?" I interrupted.

"Many are, of course," came the reply. "But they don't love their native tongue as the French do theirs. If you mispronounce or use an incorrect French word while talking to a Frenchman, you will be corrected. They cannot bear to have their language abused. They love their speech and they insist that it be used correctly. If you were to correct an American, who mispronounced an English word, he would feel insulted. But why should he? The people of this country should give their language the tribute of exact and careful usage. Why not? English is as pleasant to the ear, as beautiful and as varied in its forms as any other modern tongue."

Never in twenty years of experience in interviewing all classes of people—farmers, laborers, members of college faculties, governors, scientists, cabinet officers and Presidents, have I found a person so intense in driving home a thought as Sophie Kerr. She is all animation when she talks. She drives ahead with her argument like a North Dakota gale on the prairies. She nervously fingered a beaded hand bag which lay in her lap with one hand, and with the other she gestured as if there were an audience in view.

Sophie Kerr is a bundle of ideas. Her years as a newspaper woman and later as managing editor of the *Woman's Home Companion* have made every activity of life of interest to her. She is in touch with world affairs. Physically she looks like the dean of women in one of the co-educational institutions of the Middle West, piquant, healthy, vigorous, inspiring. She was dressed in black, wearing a little brown cloche hat, not unlike the girls to whom she had just been speaking at a morning journalistic meeting.

And then we talked about newspapers, politics and the future of women in the changed vista of affairs since the adoption of the equal suffrage amendment.

"Politics is the most interesting game that I know," she went on. "It shifts daily—the pendulum swinging one way and then back. I used to love visiting Washington to hear all the political news and gossip—most of it lies, but all interesting and amusing.

She's a Conservative

"FORMERLY I wrote a good many political stories, more or less sensational, but all true in their essence. And I am going to write about politics again. It is so many-sided, so human, that I cannot resist it.

"I am an absolute conservative in politics. I wasn't for woman's suffrage, but since women have the ballot, I vote. Women are in politics now, but whether many will aspire for the higher offices, I have not the least idea. Why shouldn't they? I certainly do not advocate a distinct and separate woman's party."

"Will the schools of journalism bring women into higher positions in the editorial offices of the nation?" was asked.

"They are already there. More of them are coming. The field of women's work will grow wider and wider in the future. More and more the women are going to the small towns and getting control of newspapers. Ohio, Oklahoma, New York and Wisconsin have papers in towns and small cities edited by women and they are well edited, with a fine news sense. Everything both of interest and importance is discussed in them. There was a time when a woman employed on a newspaper did a woman's page and acted as a music critic. That day has passed. A woman in an editorial chair is as trustworthy as a man."

A long road of slow but constantly increasing success has been traveled by Sophie Kerr (Mrs. Sophie Kerr Underwood) in winning her literary laurels. Forty-odd years ago she was born at Denton, Maryland, a small town located in the "sandy-belt" of the eastern shore. Her father had a nursery and fruit farm, now owned by the author, and she declared that he "thought more of beautiful trees than he did of people." He planted all but one tree on that farm. There was a lovely arborvitae and red japonica hedges, magnolia trees and many unusual foreign flowering shrubs.

Many were the new varieties of trees and shrubs originated by Jonathan Kerr on that farm-nursery. Luther Burbank was one of his correspondents, and representatives of the United States Department of Agriculture came for visits every year. Sophie, the younger of two children, was a favorite of her father's; she liked the trees that he pampered and adored; the orchards white with the blossoms of spring and red with the harvest of fruit in the autumn. Dominating all remembrances in after-life was, as she says, "the quiet, the calm, the extreme individualism, and the easy-going self-control of my birthplace and early habitat."

"I tagged after my father every day and all day," she explained in telling of the life on the farm, which was to assume so important a rôle in her later life and her literary productions. "Even when I was very small he interested me—and very few fathers ever really interest their children. He was an energetic, very bad-tempered man, with a biting tongue, at times a brooding disposition, a kind heart, a keen sense of the ridiculous, and a passion for honesty in speech and action.

"Before I went away to college I had learned to cook, to embroider, made most of my own frocks and played the violin worse than any person in the world. I wasn't a popular girl socially for two reasons. I had inherited my father's gift of sarcasm and there was an even greater handicap of a beautiful, popular, socially malleable older sister. Beside her I was nowhere."

While at Hood College she began to write on high-brow subjects—essays and criticisms of the masters of literature. She was determined to become an author. So she induced her father to purchase a typewriter which she pounded with two fingers, as is still an art with most newspaper reporters. One or two stories were accepted following graduation and after remaining at home for a year or more she went away for more college training, this time to the University of Vermont, for a year of graduate work. There she came under the influence of Professor Samuel Emerson and suddenly discovered that she "didn't know how to think." His influence meant much for her future.

"It is a fine thing to know that you do not know," commented Sophie Kerr. "It set me to work to try to get what I did not have—a disciplined, well-ordered, logical mind, a store of knowledge, a really broad culture. Alas, I never got any of them and I never shall. It takes different training and environment from infancy to produce them, as well as greater capabilities than mine. But I did at least get this—the habit of thinking things out for myself, and a poor opinion, thought out by the individual, is better than a lazy acceptance of someone else's say-so.

"Naturally, my year with Professor Emerson gave me a very low opinion of my chances to become a writer. I let writing alone for a while, and then began doing little light things for the Pittsburgh *Gazette*. I grew restless and I wrote to the *Gazette* people for a job. I got it—I was to run the woman's page for their evening paper and do Sunday 'specials.' The training was excellent and I worked there happily for several years."

Gradually she drifted into the writing of fiction. Some manuscripts were returned; others were accepted. Several were published by the *Woman's Home Companion*. One day she went to New York looking for a job. She found it. She became assistant editor, then managing editor, of the *Woman's Home Companion*, a position held by her until three years ago. All the time she was writing short stories and fiction. Finally she resigned to have more time to devote to her literary work.

Likes Comfort Most

"I HAD been writing pretty steadily anyway, but holding my job, too, and I was wearing myself out. I was tired and ill all the time," she explained as a reason for the change. "I had expected when I gave up office work to find my leisure an embarrassment. I planned so many things to do, how I would see all my friends often, how I would travel, read, do all sorts of delightful things that double work before made impossible. But I have done so few of them! I haven't nearly so much time as I had when I hadn't any time at all, and that's the honest truth."

Now that Sophie Kerr is devoting all of her time to the writing of fiction, she has purchased an old-fashioned brownstone house in New York and added a little Italian garden, a fountain, green shrubs and tall trees that remind her of the trees that her father planted, loved and petted into life.

One room in the house is devoted to the library where she spends several hours a day planning and writing. Most of her suggestions for stories come from observations—something that appeals to the fancy or interest. Usually it takes from one to two weeks to write a short story and from three to four months to write a book.

"I'd like a dog, a real dog, not a lap dog, but it is difficult to keep one in a city," she replied when asked about pets. "There is no room for them to exercise properly. But a year ago, when I bought the house I now live in, a black cat adopted me. Now there are two."

"What do I like most? Comfort, I think. And old painted satinwood, and cats and prize fights, and dancing and Spanish shawls, and looking at the ocean and having my own way. And I dislike argument and strong perfume and fat women, and people that tell the sort of lies that simply insult your intelligence, and men who begin letters, 'Dear Lady' and long earrings and intolerance."

The Balkan Politician Is Not a Lovely Animal

He Will Promote a War Just for the Opportunity to Graft

By SAMUEL CROWTHER

THE chief business of the Balkan States—by which we mean the countries in and about the Balkan Range in Eastern Europe—is war. It always has been war. We think of farmers as men who want peace, but in these countries, made up almost entirely of farmers, the main industry is war. They do not want war because they are farmers but, although we seldom stop to think of it, a farming country suffers less from war than does an industrial country. For one thing the farmers can go out to fight leaving their women folk to do the work. That is not the case in America but it is the case in Europe. In the second place, a devastated farm country will recover more quickly than a devastated industrial country, for the land, which is the chief thing about a farm, remains almost unhurt. And that may be one of the reasons why the Balkan States—Bulgaria, Serbia and Greece—have most of the time been at war among themselves or with Turkey. In a way they are not so much to blame, for, although they do get up wars of their own, they have also often been driven into wars as tools of France, Germany, or England. For it is easy to get them started into war. Sometimes it is hard to keep them out. For instance, while I was in Belgrade, if England had not stepped in, another first-class war might have started, for the army of Jugo-Slavia was ready to march on Bulgaria just because a revolution in Bulgaria seemed to make conquest easy.

The Great War started down in these parts. The Austrian Crown Prince was assassinated in Serbia and thereby Serbia drew an ultimatum from Austria which was backed up by Germany. Of course there was no good reason why Germany should have marched through Belgium to attack France because an Austrian Crown Prince got killed in Serbia. But why look for logic in war? If logic were ruling there would be no war. Jugo-Slavia is one of the several danger spots in Europe and it is well to know something of the country, if only to know why the ordinary rules of common sense and honesty do not obtain in the affairs of Europe.

They, Too, "Won the War"

THERE is no such country as Jugo-Slavia; that is just our English nickname for what is officially the Kingdom of the Serbs, Croats, and Slovenes—a governmental unit invented by the diplomats after the close of the war. Serbia was one of the Allies; her troops are among the best soldiers in the world. Her capital, Belgrade, was taken by Austria shortly after the beginning of the war and the Serbian army was thereafter all but homeless. Serbia suffered more than Belgium and it was held that as a victor she was entitled to considerable spoils—and also the diplomats wanted to dismember Austria-Hungary but did not quite know what to do with the pieces. So they combined some of the pieces into a new state.

Serbia had been a little country nestling in the foothills of the Balkans, with Austria-Hungary closing in on the north and west, Bulgaria and Rumania to the east, and Greece to the south. It was shut off from the sea and, although this really made no difference, the people thought it did—or rather, being shut off from the sea gave the politicians something to talk about.

Europe has an unending argument about nationality. The general thesis is that people of the same race should be grouped under the one flag. That is the trouble in the Balkans. For these are proud peoples; they will tell you so. They are brave peoples; they will tell you so. In some ways it seems unfortunate that history was ever invented, for all of these peoples have histories and in ages past each of these countries for a time ruled much of Eastern Europe. They have been at war of some sort about every ten years for centuries. They have seen their borders grow by conquest and have seen them shorn by conquerors. And finally all of them fell before the Turks when the Turks swept into Europe.

The nationalities have been considerably mixed up—one cannot detect a long-lost brother just by looking at him. The leading tests are these: if the man speaks your language, he is yours; if he does not speak your language but has your religion, he is yours; if he has neither your language nor religion, then it is because both have been taken from him by perfidy, and he is yours anyway. And so each country has a valid argument for owning at least part of some other country. It all seems rather ridiculous to us, but it is really a very serious affair and unfortunately all the great nations of Europe take advantage of the peculiarities of the little Balkan States to play off one against the other to preserve the perilous balance of power in Europe.

The Serbs think that they played a large part in the Great War—in fact they, too, "won the war"—and by the grace of the peace conferences they succeeded in having granted to themselves the materials for the making of a greater Serbia. They were given Croatia; Slavonia, Dalmatia, Herzegovina, and various odds and ends of territory which had been a part of Austria-Hungary and which is essentially Slavic, and in addition they succeeded in getting a slice of Bulgaria and a part of Macedonia. This gave them an irregular boundary line extending about four hundred miles north and south and about three hundred east and west at the widest point, with a long frontage on the Adriatic Sea—but without a port. The commerce of all this section before the war went through Trieste and Fiume—both of which belonged to Austria. Now Italy has Trieste and would like to have Fiume, which is by treaty a free city—meaning that it is something held up to fight for. Italy practically has Fiume and almost had a war.

The land covered by what we call Jugo-Slavia is immensely rich; it has fine fertile soil in parts, extensive timber land, and is said to contain many kinds of minerals. The farming and the lumbering are most primitive; they use very little machinery and when I passed through at harvest time practically all of the work was being done by the women. The farmer cannot see why he should bother with machinery if he can get plenty of women to work for nothing. It is the "for nothing" part that counts. The peasants hereabouts value first their farms, then their live stock, and finally their wives. It is mighty hard to get a farm or good live stock, but it is easy to get a wife and the peasants make no bones about it.

There is no reason why they should have a different outlook. They have never had a chance to gain any other. Very few of them read or write, for the schools are inadequate. They have never known a real government—that is, a government which existed for any purposes other than the support of the politicians. Every little while they find themselves called out to war and they go. They think that in each war they are defending their farms from an invader—that is the story they are always told. Having no newspapers, they have no way of finding out what is really going on. Of course Jugo-Slavia has plenty of newspapers, but they are all little partisan sheets and even a peasant who can read will rarely bother with a paper. The peasant does not mind going to war, for his establishment is organized as those of our Indian tribes used to be—the women do the essential work.

The towns are very different from the country. The towns do not amount to much as towns, although they have made some progress since the war. The townspeople wear collars and talk; the peasants wear their native dress or any old thing they happen to have and do little talking. The towns cause all the trouble, for it is in them that the politicians live. Being a politician is a profession and Serbia has the king of all the politicians of Europe. His name is Pasitch; he is seventy-four years old and has been in politics for fifty-five years. The nominal ruler of Jugo-Slavia is King Alexander, an extremely unimportant young man, who is principally interested in escaping assassination. His father, King Peter, was the only king for many years who died a natural death and Alexander aspires to do likewise. He hates Pasitch and the hate is returned, but always Pasitch turns up as prime minister.

He has made a great deal of money out of politics—just how much no one knows, but the sum runs well up into the millions of dollars—and he is expert in bringing enough political parties together so that only he can command a majority in the Skupchtina, as the parliament is called.

When an agreement was drawn up by which under certain conditions a firm of American bankers was to lend seventy-five million dollars for the building of a railway to Cattaro, the parliament was quite unanimous that none of the money should pass through Pasitch's hands. He did not consider this as expressing any lack of confidence in him and neither did his friends who voted for the motion. It was just that they all agreed the railway ought to be built. It is taken for granted that every man in politics and every man in office will take what he can while the taking is good. For instance, when I had my passport examined at the station on arriving at Belgrade, I was told that the formalities would take an hour. Then a friend who was going to meet me turned up. We went over to the passport office and found two men smoking cigarets. My friend slipped fifty dinars (about fifty cents) on a desk and the passport was handed over most graciously. Again, when I reached the hotel, I found signs all over saying that every foreigner must register with the police within twenty-four hours. I was told that the registry would take several hours and that I must go in person. A little later one of the hotel men whispered to me:

"If you give me fifty dinars, you won't have to go yourself. We can fix it for you."

Just Graft, Graft, Graft

THE whole population of Jugo-Slavia is around twelve million and of them two hundred thousand are in the civil service. The average pay of an official is about fifteen hundred dinars a month, or, roughly, fifteen dollars. An official's family can just exist on around fifty dollars a month—so it is up to the official to find the balance. It is quite impossible to get any business of any kind transacted without a tip; and if the tip be large enough it is possible to do about as one pleases. Tipping is a custom of the country. The man who buys for a principal expects a rake-off and he gets it; the principal would rather see him take the money than be forced to pay him a living salary. There is a vast demand among the politicians and the town dwellers, who are mostly politicians, too, for graft, and behind most of the intense patriotic movements for the acquisition of new territory—the gathering-in of long-lost brethren—is nothing higher than the desire to extend the opportunities for graft.

This is not a lovely picture but the Balkan politician is not a lovely animal. He will promote a war with all its death and destruction just to have a chance to graft. The politicians are the first charge upon the country; the second is the army, which consists of at least two hundred thousand men and may have more than that, for few of the figures one gets are truthful. These people do not believe in telling the world how many soldiers they have. The privates get about a cent a day; the officers will average in pay less than the civil servants. This is not a country of incomes, so an officer to live must borrow against the next war.

The families of the country are large; probably there are two million families and they must support these four hundred thousand non-producers—the army and the civil servants. That is, indirectly, each five families have to support one extra family.

In the Greater Serbia the politicians saw a fine melon but the melon is not as ripe as they hoped. Croatia is proving the greenest portion. It always has been indigestible; it caused Hungary a deal of trouble. For it has in it the only politician able to cope with Pasitch. His name is Raditsch, and while Croatia elects sixty members to parliament, they all refuse to sit, on the ground that they are a separate people and ought to be a republic. The Croatians speak the same language as the Serbs, but they use the Latin characters, while the Serbs use the intricate letters which are known as Kyril. The Croatians are Roman Catholics, while the Serbs belong to the Eastern Catholic Church. This is enough to cause bitter fighting—mostly oral.

I was in Croatia when King Alexander came through in his train; he had Serb soldiers every quarter of a mile along the track, ran an engine ahead of the train to test the road for bombs, and traveled with all the blinds of the cars down. The Serbs keep only Serb soldiers in Croatia and they are trying to force Serbian as the written as well as the spoken language. In most of the annexed provinces all the school books are in Kyril; in Croatia the books are in both the Kyril and the Latin characters.

A City Without Water

AS FOR the country itself; there is great talk about improvement, but nothing is being done except in speculative building. Buildings are going up all over, and in Belgrade, which used to be a one-storied Turkish town, at least fifty big buildings are going up. That would seem enterprising, but few of these buildings are finished; the builders started them when plenty of paper money was to be had. Now they have to pay thirty per cent and forty per cent for loans. But here is the remarkable fact. None of these buildings has water. I stayed at what was a not bad hotel. It had a roof garden and a theater and it seemed modern. But when I turned on the faucet for the tub no water came. I rang and the maid told me that there would be water in the evening. The water was on for exactly half an hour that day. I thought that some accident had happened to the waterworks but then I found that the city rarely had more than two hours of water during a day and that most places bought their water from men with barrel carts. It seemed strange and so I asked a Serb—a rather prominent man—why all this was so.

"Quite so," he agreed, smilingly, just as though he were discussing the most comprehensible of facts, "it *is* awkward, but what can we do? Belgrade before the war had only seventy-five thousand persons and now it has one hundred and fifty thousand. We have the same waterworks we used to have and it is not big enough. We are waiting for the reparation payments to build a new one."

But while the city is going without water—with all that that means in a sanitary way—the government is steadily borrowing money from France for munitions which are made in France. The only credit the country has is for munitions from France.

I got into Sofia, the capital of Bulgaria, just a week after the revolution which had caused Jugo-Slavia to think about mobilizing its armies. The revolution had been quick and painless. One night the reserve army officers had moved quietly on the government buildings and taken them over. Other detachments moved on the house of Stambuliski, the prime minister, and on the houses of his various ministers. When Sofia awoke the next morning the old government had been thrown out, most of the ministers were in jail, and Stambuliski was a fugitive. He was later caught and killed—accidentally the reports have it—but there are accidents and accidents.

The ministers of the preceding administration who had been jailed by Stambuliski were released and at once the king appointed Zankoff, a school teacher, as prime minister. It was a high-handed proceeding but the extraordinary part of it all to me was that no one seemed in the least to care. I talked with several of the ministers who had been released or who had returned from exile. They were busy seeing how they could get into power under the new government and passed over the *coup d'état* as a minor matter. I talked with peasants and I expected them at least to have something to say, for Stambuliski had gone in as a friend of the people—as a dirt farmer in a country of dirt farmers. The peasants were not even interested.

I asked some of them about the country tending toward Bolshevism, for under Stambuliski the leaders often took their orders from Moscow. They did not know about it and they did not seem to care. All that they knew about Russia was that too many Russians had come into Bulgaria—they came by the thousands for a time. General Wrangel's defeated and almost starving army came en masse. They had distributed these Russians—such of them as would work—among the farms. Others took to restaurant running and others moved on. The Russian problem to the peasants was getting rid of refugee Russians. All of which merely goes to show how little the news of politics touches what is really going on in a country.

Bulgaria is a little state in the Balkans which is supposed to be largely inhabited by brigands who tie their shoes on with rawhide thongs and wear sheepskin coats. Those of us who I suppose must be called the slightly elder generation know the place by name through whistling tunes from the "Balkan Princess." The really

American Workers Want Room in the Sunshine

Nation's Great Industrial Centers Are Surging Toward the Out-of-doors

By FRANZ A. AUST and HAZEL HANKINSON

Points to Ponder

Belgium's folk live 700 to the square mile; England's, 650; Germany's, 300; Uncle Sam's folk only 35!

About seven out of every ten folks in the United States now live in cities. These cities have a density of from 500,000 to the square mile down to 8,000 to the square mile.

Nearly every other family in the United States owns an automobile or truck.

The speed of an automobile on the open street is twice that of a street car and almost three times that of a horse. But automobiles lose their efficiency as density of traffic increases.

Yankee patience will stand only about so much inconvenience before bolting. How long until industry and retail business will take to—the big out-of-doors!

WITH Chicago's World Fair in 1893 a new standard for civic beauty was born. In the earlier years humanity had crowded in wherever Industry was blowing her whistle as a summons to put on overalls and go to work. Closer and closer to her smoke-stained chimneys did America's sons and daughters press until the very sunlight was shut out, and the stars were hidden. But following closely upon the Fair year, the pendulum of Industry's time-worn clock began to swing in the other direction, and now it is more than halfway back to the other side—from grimy streets to the great out-of-doors.

One hindrance to locating manufacturing interests outside of congested city centers has always been the great expense of hauling the coal necessary for heat and power. Besides, there is the overcrowding of lake ports and seaports. But now comes the "super power" electrical plan which is urged by leading engineers and Mr. Hoover. Networks of great power highways east of the Mississippi and west of the Rockies would be built by this system, and electricity for industrial and commercial and domestic purposes would be distributed even to tiny villages tucked away at the end of country roads. Most of this current would be supplied by water power. Even the railroads would be electrified, and the saving to them alone would be some $84,000,000 a year. Tremendous! But the most outstanding improvement to the country would be the opening of country towns and cities to great manufactories with power costing no more than in the crowded centers of industry!

Whether this mighty project takes form, some such solution must be the result of the nation's urge toward saner, less congested living conditions. This call to the out-of-doors is being heard on all sides, and because of it Uncle Sam's cities of industry are divided into two classes.

First, there is the city which was laid out years ago. In many cases it is being made over with the comfort of the factory worker in mind. Factories are being built on the outskirts. There, surrounded by flowers and shrubs and trees and green grass, the workers give healthier, happier service than they could possibly offer in quarters inclosed by brick walls and blackened chimneys.

Homes within sight of the factory—almost under its very eaves! and yet they are artistically attractive homes in a happy community of workers employed in a great industry which has found its place in the great out-of-doors.

These are not the homes of manufacturing owners, but of workmen, mechanics, employed within a factory's walls. Nature's beauties are everywhere and large lawns insure privacy for each family as well as playground for the children. The workmen who own these homes belong to an industrial community which has found that there is — plenty of room in the sunshine.

Dayton, Ohio, furnishes an illustration. Beautiful, comfortable buildings at the edge of the city for the thousands of employes. Gardens for the asking, baseball fields, playgrounds. Near by lies one of nature's beauty spots, acres and acres where workers may picnic and camp.

Another city has recently established a large consolidated business three miles out from the center. There the workers live under the very eaves of the excellently organized industry of which they are a part, but, they, too, are on the verge of the open country. It is another attempt to bring a city's work and workers to the outdoor world.

There is many a large city which is spending millions of dollars in trying to correct the location of its factories once haphazardly placed. Factory owners realize that working folk cannot do their best when they live herded in ugly places—unhappy places, unsightly and unsanitary. Slum tenement sections are doomed.

Ojibwa, Wisconsin, is the heart of a 60,000 acre colonization project. Its homes, its streets, its public buildings, its parks, its playgrounds, its business districts, are all being designed with one object—to attract those who are interested in wood-using industries, and to invite those who desire to undertake the business of canning. These industries, of course, to blend with and to develop the agriculture of the country round about.

Towns are like folks; they have personalities; and they are always judged by the appearance they make. That is why the towns which are laid out with room for beauty and recreation and home gardens will everywhere attract the best types of industry when factory owners are looking for new sites.

The new community centers are not "garden city" plans in the commercial sense which has become somewhat unpopular. Neither are they copies of the garden cities of the English folk who have been so successful with that movement in their own country.

In England, this progress toward better conditions among industrial workers has reached its height in Letchworth, thirty-four miles northeast of London. There, some twenty industrial firms and their employes make up the town of less than fifteen thousand. A self-contained town it is, providing garden-surrounded homes of equal size for everyone, with a stretch of fertile farming land on every side. The aim of the little city has not been merely to bring into being a beautiful town; it is to bring about the improvement of the laborer in his work-life and in his home. And the result has been accomplished under English conditions.

C. B. Purdom, who chronicled the movement in England, gives the following in his definition of their garden city, and this is the part which may be applied to America's new community centers:

"A garden city is a town organized for modern industry; of a size that makes possible a full measure of social life; surrounded by a permanent belt of rural land."

The "garden" part which is not mentioned in this definition is a feature which caused the English movement to fail when it was tried in the United States. English garden cities have not been adapted to our country. For every factory or business worker to have an equal plot of ground about his home to use for vegetables and fruits and flowers was found to be far from practical. All American workers do not enjoy gardening in the same measure. Neither do they understand gardening as the English do; some do not even know how to till the soil. Furthermore, English laborers have for centuries been accustomed to centralized control of their land, while in America every man wants to own his own little "two-by-four," or larger plot, or he wants it not at all.

Any plan for better industrial cities which is to succeed in the United States must be a plan for community development. It must provide for a great variety in ownership about a man's home. One man who works in a factory will desire a small lot with only a few trees and shrubs for ornament. Possibly he will not care to have a garden at all. Another man when he is through with his day's labor will delight in taking care of two or three acres of potatoes and corn and cabbage and other "truck."

Many of the new American industrial communities, like Ojibwa, will be closely connected with the agricultural life which borders it, and which is so vital to its business interests. When this little industrial city becomes fully developed and realized, it will be a part of the countryside; the farm life will blend into the town life, for many of the industrial workers will be miniature agriculturists on their own home grounds.

The English garden city movement implies that the ideal city cannot well include more than seven thousand to fifteen thousand folk. The size of the American community of workers living under ideal conditions is limited only by the amount of food materials which can be grown in that vicinity, and by the ease with which a man can get to and from his work. In this, of course, distance is not so important as a fast and safe means of getting there. He must not be more than fifteen or twenty minutes ride from his place of work. Otherwise, what time does he have to enjoy his home and his garden and the recreation he likes best?

And not alone does this apply to factory and other industrial workers. Our greatest metropolis has an example of its business folk moving out to the greater freedom of a community by themselves. Jackson Heights, just outside New York City, is one of the most unusual illustrations of the movement away from massed centers of population. It is a one-hundred-percent-American garden city, a transition which is not too sudden for the family apartment-house born and bred, and yet which shows the tendency toward the new, the more open city of tomorrow.

Those who planned Jackson Heights believed that the apartment house is the kind of dwelling in which the average New Yorker feels most at home, although he desires to live in the open. So in ideal rural surroundings this little apartment community began to grow. Every resident owns his own apartment, buying it as he would a house. He pays a couple of dollars a year for country club privileges. He can have a patch of land in a corner of the town on which to raise vegetables and flowers if he chooses. He has a right to one of the colonial-cottage garages. He has the privileges of the tennis courts and the golf course and the children's playgrounds—for Jackson Heights believes in children.

This little democracy has its own community activities which help to keep it contented and happy. Instead of joining clubs and other groups in the heart of New York, these folk prefer to play together. They have a woman's club, and a chess club, and a press organization and a tennis organization. They have annual harvest festivals and tournaments.

Although these New York business folk live in their beloved apartments, Jackson Heights is a "home" town. The apartments are not "beehives" divided into little cells; the architecture is artistic and different, and the distance between them is such that they do not conflict. Every apartment overlooks a garden court which a man and his family are free to enjoy. And all this transplanting has taken place just twenty minutes from Broadway!

While the apartment-house community like Jackson Heights may be a splendid plan for the trend of business folk toward the country, there is a better arrangement for industrial workers who do not need that gradual detachment from crowded city living. A place of five thousand or six thousand out in the open country, for instance, may contain important manufactories, and yet may have the happy conditions of both city and rural advantages.

A greater appreciation of the out-of-doors and of natural beauty is surely forcing itself into America's national life.

There is the influence of the out-of-doors upon Industry's little children. What chance is there for character to grow and expand when suffocated between brick walls and warped by the heat of pavements? It is from country and small-town playgrounds that most of America's leaders and notables have come.

How many of tomorrow's important centers will be housed in miniature cities under rural conditions, ideal in plan and beauty? Their numbers cannot be foretold. Many a mighty metropolis, moreover, will continue to be an important center, but under conditions of greater communion with the out-of-doors. America has stepped on the starter headed toward The Perfect City!

"Oil Ducks" and Other "Lame Ducks"

Why Members of Government Are Hired by Interests After Leaving Office

By A. R. PINCI

FOR many years we have been accustomed to hear of the "lame duck." The latest use of this term was in Congress, and it was applied to Frank B. Kellogg as soon as he was appointed ambassador to London. There was the fear, on the part of two or three dissenters, that a President of the United States commits a grave error when he appoints to public office a man but recently turned out of office by his constituents.

There is no doubt that, except in unusual cases, the lame duck's return to the Treasury pay roll by Presidential fiat perpetuates a bureaucracy in violation of the people's will and makes the Executive superior to the will of a section of national opinion.

Senator George W. Norris, of Nebraska, whose comments in the Senate about the Harding-McLean intimacy were suddenly headed off by Senator Henry Cabot Lodge during a debate, just at the time when visitors were hoping to hear something about the young man's ambassadorial aspirations, has been a staunch antagonist of the lame duck system in vogue today, and he frequently criticized such appointments. He has spoken in favor of legislation which would prohibit a lame duck's sudden convalescence through the potency of another government job.

But such a law will never be enacted. How could it? With few exceptions—these consisting of a few wealthy men and of those who can count upon keeping their seats as long as they elect—Congress is made up of hundreds of potential lame ducks. Nothing so spoils a man, from what I have observed in twenty years of journalism at leading capitals, against resuming his former job as a taste of public life. Thus with an eye to the hazards of future politics he will not go out of his way to enact a law which would be very embarrassing in time of need. Of course, not all lame ducks are called, but where is the public official of today who thinks himself the unavailable lame duck of tomorrow?

There Are Lame Drakes, Too

PICK up a copy of the Congressional Directory—be it bound in red, blue or green, which distinguishes the session—and one may find a goodly sprinkling, in the administrative half of that book, of lame ducks rehabilitated by Presidential fiat. But these are not the only lame ducks, for there are others, very many others, who do not appear in the Congressional Directory.

Those are the lame drakes, and have their origin in administrative office. They are the public officials thrown out of employment by the fortunes of politics. The rest have two alternatives, that of returning whence they came, or of tieing up with some big business concern. The first alternative has few votaries; the second is more fashionable.

It is not always the good fortune of officials to be cast into a branch of the public service which will bring them in contact with the representatives of big business, hence the hopeful ones "open law offices" in Washington. Needless to say, if Congress is going to investigate all the employment relations of former public officials it should, for consistency's sake, take a peep at these law offices, which in five years have multiplied like mushrooms, and, incidentally, to look up the court records of the capital and see how often these attorneys *do not* figure in court proceedings. It will violate no propriety for me to say that they are not employed for the law they know or can interpret, but for the knowledge of what had transpired in their bureaus prior to their separation from them, and for such influence as, through their familiarity on the one hand and intimacy with some of the personnel on the other, will bring results.

Now, the ethics of this situation has been questioned a long time in Washington. As another matter of fact, the better known segments of big business have quite abandoned the practice of employing ex-public officials because they have found out that they have been goldbricked, and even where this has not been the case, the time and cost involved in "explaining" to subsequent committees of investigation exceeded the value of the employe's services.

No better example of this is possible than ex-President Wilson's retirement from the law firm of which he became a member after leaving the White House. In a year he came to the conclusion that punctiliousness dictated his withdrawal. It was frankly said that no firm of attorneys specializing in international and national affairs in Washington could compete with the ex-President's firm, and this in turn led to gossip which must have reached Mr. Wilson's ears, because it distressed his friends.

Employers of ex-public officials, the lame drakes (to distinguish them from the lame ducks which are Congressional), have been very slow in learning that the lame drakes, like their sisters, have by the very nature of their elimination from public office lost what influence they were supposed to have, and that whatever "inside" knowledge they possess is next to useless. To make up for what lacks, they endeavor to exert influence by sheer force of costly entertainment, and it is well known in Washington that if these entertainers were suddenly removed the hotels would not only be half empty, but the dining rooms would become dismal caravansaries. And yet this does not take into account that little army which does its entertaining at home, be this a house or an apartment.

Senator Norris, by the way, was instrumental in putting into the record two years or so ago a long record of a lobbyist who was representing a dozen important corporations and getting from $500 to $1,000 monthly from each employer. This man was not a public official but he was a member of the press gallery, and as soon as his activities became known was expelled from that body. Now, members of the press gallery enjoy a quasi-Congressional status, and are inhibited from being employed "directly or indirectly, by any stock exchange, board of trade, or other organization, or member thereof, or brokerage house, or broker, engaged in the buying and selling of any security or commodity or by any person or corporation having legislation before Congress."

That is piffle. What information a member of the press gallery in Congress can get which any good newspaperman not a member cannot get is problematical. One does not have to sit in the press gallery to get an idea of what is going on in either House; one can sit in the visitors' gallery. And, with due respect to the press gallery, more information reaches the outer world for which its members are not responsible than the public dreams of.

Congress has professed to be scandalized by what has transpired in the oil inquiry with respect to the employment of ex-officials by, in this case, the oil companies. If that is a crime, is no attention going to be paid to all the other ex-officials (some very much X, by the way) representing other interests?

Does public office imply that upon leaving public office an incumbent cannot accept private employment except of the most humble kind?

A law was proposed some time ago which would prohibit the President from appointing any ex-member of Congress before two years had elapsed since the latter became a lame duck, but nothing was said about the lame drake. And if Congress wants to be consistent, why does it not go so far as to enact a law for prohibiting private employers from enticing public officials from their jobs, especially during the life of the administration of which they were a part or under which they served?

The Senate investigating committee was told that two prominent attorneys were employed for the supposed influence they could exert with the Wilson Administration. Will Congress dare to enact a summary law excluding public officials from such employment hereafter? Private inquiry on the part of friends of this legislation seems to have revealed that such a Congressional dictum would be Constitutional if properly worded; here is the chance for Congress to prove that its investigations mean something.

Lobbies Largely Precautionary

PERHAPS nothing could be better for the sake of the taxpayers and of efficiency if prominent employers ceased their efforts to employ more or less prominent government officials, or, at least, to stalk them while in office, to entice them away, or to let them know "that they will be taken care of" in due time, which means when their political term was over. There are too many such officials, especially in the intermediate classes, whose time is taken up with plans for the future. Not directly, no, but by reflex action. No sooner a chap from some adjoining desk or office or floor or department is absorbed by some corporation than the remaining ones begin to wonder how soon the same lightning will strike the same way.

Gossip is caused by the frequency with which men, not necessarily prominent themselves, but close to prominent men, are seen at luncheon in secluded corners of hotel dining rooms, in the company of more or less miscellaneous individuals recruited from the press or Federal ranks, representing this or that company, this or that board. Gossip starts with the rival interests, and in Washington there is always some rival interest on the lookout for these friendly gatherings.

But one thing must be said—that if Congress wants consistently to finish the job that it has apparently begun with the oil inquiry, and wants to assess the merits of the vast number of jobs given to officials and ex-officials, it may have to go back many years, and look up even the ex-Presidents themselves. As a matter of record, very few men, in comparison to the little army that has been employed, actually remained attached to their jobs very long. That proves how flimsy was the bond that held them to their private employers.

What Congress will discover in the present inquiry remains to be seen, but it is hoped that that inquiry will be comprehensive, and that no two men, one Republican and one Democrat, will be singled out as the outstanding goats. *There is too much talk in Washington that if it had been foreseen that the investigation was going to drag in so many names it would never have been undertaken.* The Congress must go through with it, no matter who must fall.

Two-thirds of the lobbies maintained at the capital are precautionary; they are maintained because the "other fellow" runs one, and it is always well to be prepared. I can say definitely, that the average company, which employs a crew of ex-official gladhanders, has found to its sorrow that it begets but gladhanders, palms up. *This excludes the army of underpaid technical men in the Federal employ, who leave their jobs only when economic necessity dictates the change, and Congress, while about it, might revise wages so as to give the $10,000 salaries to the technical men and pay the $2,000 salaries to the politicians.*

"Will Congress Find Out?"

BY PAYING the politicians just what they are worth, downward, and by raising the excellent technical men to a worth-while salary, the evil of bidding by the interests will be greatly diminished. It is all bosh for Congress to say that technical men are willing to work for less because they are made happy by the sense of patriotism which causes the sacrifice, for on that basis, and taking Senators and Representatives at their word —I can quote by the *Congressional Record* on this point —most members ought to be willing to work for 30 cents a year, on the assumption that every perfervid oath of patriotism is worth ten dollars.

Let Congressional lightning, if it strikes with unerring justice, hit whom it may, but let's have a nice perspective of the personalities at stake in all their phases. Before Congress can cast many stones it had better sift matters so as to take in everybody. Washington has been full of rumors for years, but to them nothing but a deaf ear seems to have been turned. When a Senator rises to make certain declarations in which names are mentioned, no one should interrupt him in order to change the subject.

But that is not all.

The picture would not be complete without the reverse exposed. That involves the allegations of graft and corruption which Congress has often charged, usually to the account of one prominent individual who is known the world over for never having spent a cent for favors. Thus, just as certain irregularities are possible but unnoticed while perorating about fantastic lobbies, so is a question of a few thousand dollars permitted to obscure, by mishandling and other causes, others which, by common report, have reached into the millions.

The late Secretary Franklin K. Lane, in one of his letters, referred to unnamed individuals who had the knack of turning into gold all that they said, all that they did, all that they touched.

Ever since then the mysterious question in Washington has been:

"Where did they get it?"

And now the newer question is:

"Will Congress find out?"

Our Girls Are Growing in Size and Strength

Concluded from page 3

to the changing times. Gradually the skirt has narowed and shortened, while the waist has become broader. In any consideration of the advantages to the health of women in the narrowing and shortening of the skirt, it must be borne in mind that reference is not made to such vagaries of fashion as seen in 1911 and 1920, developments which would be just as hampering to freedom of motion as were the heavy voluminous skirts, although the excessive narrowness was compensated for in part, at least, by an equally and unduly excessive shortening. These very extreme styles were of relatively short duration and therefore of minor significance.

Vassar's investigation in regard to girth showed a steady decrease until 1904, and a steady increase from that year until the present time. The width of the waist followed the fashion, and, when the demand of fashion for a small waist finally ceased, the increase in width of waist occurred, slowly at first, but rapidly after 1908. No wonder college girls grow more rapidly when internal organs are given a chance to respond to normal exercises!

How is this change in fashion, which permits more normal functioning and greater freedom of exercise, related to increased height?

One of the serious problems in regard to college girls during the early days was how to induce these delicate, undeveloped women to eat enough nourishing food. The girl of this first decade lacked appetite. Modern girls, vigorous and physically fit, eat in season and out, and are as hard to satisfy as a growing boy—and for the same reason; the body is working normally and needs more food for growth and development. Here we find a reasonable explanation of the fact that the woman not only functions more perfectly, but weighs more and is growing taller, while, as was demonstrated in 1917, the difference in muscular quality between men and women is due to the use of muscles and not to sex.

Often the younger woman—and the older, for that matter—does not play fair with herself. She holds on with both hands to privileges granted her because of weakness and dependence and at the same time demands freedom and equality. The college girls first showed a disposition to break away from this attitude toward conventionalities and their vision is being reflected in their better health and larger stature.

We translate life constantly in terms of sex. The new baby has its layette prepared, pink for the boy and blue for the girl. We begin to make this difference at birth and continue it through every period of the woman's life. The young girl of the late nineteenth century heard constantly, "You must not do this; you must not do that; you must be ladylike."

Since it is use and not sex that determines the quality of muscles, the physical inequalities of man and woman will last just as long as the girl occupies her leisure time making tatting to decorate her clothes while her brother spends his leisure playing ball. We must go back to the old Greek idea of physical perfection for women. The traditional manner of thought is getting away from the idea of incapacity.

This splendid, modern woman, grown taller and more vigorous because, freed from restricting fashions of dress, she exercises more and frequently eats more, has become better fitted to be the mother of finer sons, the promise of a stronger race.

California Puts Her Convicts on the Pay Roll

Putting Men in Prison Costly, Working Them Under Decent Conditions Aids Them When Free

By HARRY H. DUNN

JULIAN H. ALCO,

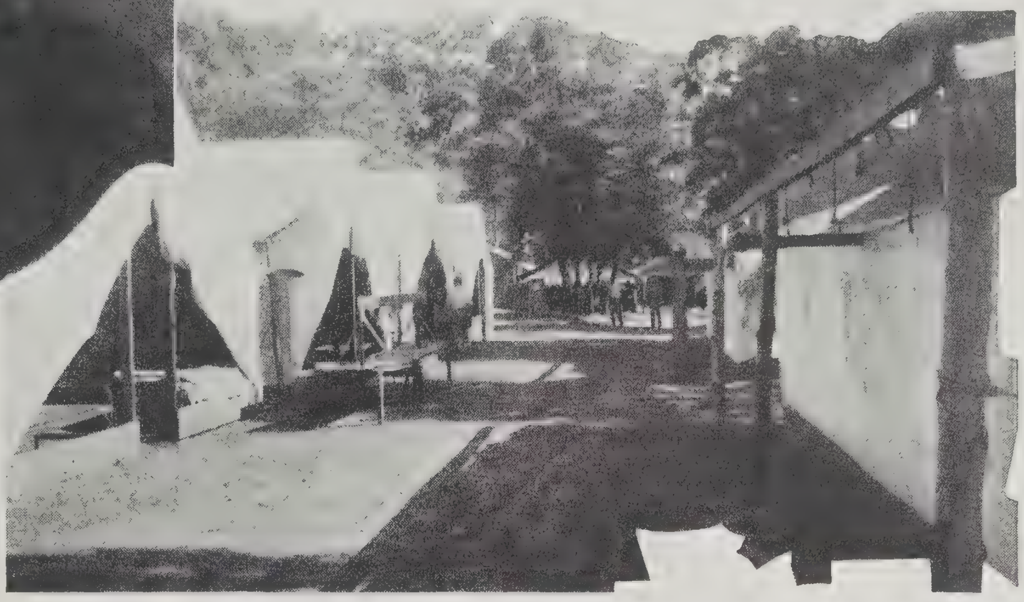
Of San Francisco, author of the law under which California has begun the payment of convicts for their work on the state highways.

PUTTING men in prison is costly business; keeping them there is still more expensive. Some students of criminology, economics and history have declared that from no point of view does it pay society to confine its wrongdoers. Men in charge of state finances have discovered that it costs, on the average, $1,000 to arrest, convict and send to the doors of the prison one man, with an added expense of at least $350 a year as long as he remains there. Efforts to take the burden off the taxpayer have been met by various schemes, most popular of which has been the selling of convict labor, in quantity, to contractors, but the results have been bad, both for the state and for the convicts.

Now comes California with a new plan, the result of study by state economists, prison wardens, welfare workers in the prisons, and students of penology. The law is now in effect, with what appears to be good results to the state and to the convicts. The law provides that the state, through the California State Highway Commission, shall employ on the construction of its highways all available convicts, and shall pay them $2.50 a day for every day they work. Pronounced criminals, men convicted of manslaughter and of degrees of murder which do not carry capital punishment, so that the men are held in penitentiaries, are barred, but the prisoner known as the "ordinary" convict, who perhaps has committed his first crime and probably will "go straight" if given the opportunity, is included in the workings of this plan.

The law was drawn up by Julian H. Alco, of San Francisco, who has been for years a welfare worker for one of the largest Protestant churches in the prisons of California. It was actively supported by some of the wardens and prison authorities, and opposed by none, and so won the recognition of the new state administration, headed by Governor Friend W. Richardson. It is claimed that for every 1,500 convicts so employed, $1,000,000 will be saved every year to the taxpayers. I talked with Mr. Alco, on the day that he returned from the several camps of convicts, established under the new law, and, while we talked, a half-dozen men whom he had helped to paroles from San Quentin and from Folsom, called on the telephone to report. The smiling little man, apparently without a care in the world, has passed years of his life within prison walls as a voluntary worker in the behalf of men whom the state restrained, and out of his experience has come a law intended to prepare the convict for a better life; to provide his dependents with a livelihood, and the prisoner himself with strength to retain his self-respect and his initiative.

"The idea grew out of the unfortunate relationship between the state and the convict," said Mr. Alco, disdaining to give himself any credit. "The actual cost of sending a man to prison—trial, judges, attorneys, juries, police and transportation—ranges from $1,000 to $5,000, a minimum average of $1,000. California spent, in the biennial period 1921-22, approximately $300,000 on transportation alone for convicted men to penitentiaries. Further than this, it costs the state an average of one dollar a day to keep a man in prison, that is, let us say, $350 a year, a low estimate. After the state has had a man in prison, it releases him to start life all over—with five dollars in cash, but with no initiative, no resistance to criminal influences, no clothing and no job. When the law was passed giving the released convict five dollars, that sum was equivalent to fifteen dollars now; today, it will barely sustain him for two days. The new law provides that the men are to be paid $2.50 for each and every day on which they work. This money is placed to their credit with the prison from which they come. From it is deducted the cost of their transportation to the road camp in which they are employed; their food and their clothing—for convicts in California do not wear striped uniforms. Transportation is obtained at a reduced rate, and food at cost with a slight additional charge to cover handling and preparation. Clothing, shoes, and tobacco, candy and other 'luxuries' are supplied at cost. Sales of army clothing and shoes provide equipment for working at costs far below those at which the men could buy them were they free. Good army shoes, for example, have been supplied at fifty cents to seventy-five cents a pair, overalls at twenty cents to thirty cents, and shirts at correspondingly low prices.



Looking down the main street of Camp C, showing the sleeping tents for the convicts. The last tent on the left is the library, which must be maintained in every camp.

"These men save at least seventy-five cents a day. This sum is to their credit, and on their release, less the amount paid to dependents, is paid to them. The men not only have money on which to live until they have obtained work, but they are provided with the knowledge of road-building as a basis to obtain a job. Further, the state has arranged with road-building contractors to take into their gangs those men who are released with good records. Thus the law provides the man with money and work, and in addition has preserved his initiative and his self-respect.

"The work gets the man out of prison and out of prison thought; it gets him away from instruction in crime, puts him amid clean, healthful surroundings, and gives him the greatest opportunity to 'come back' ever offered. To secure the future of a convict who has paid his so-called 'debt' to society, employment must be obtained for him. In most cases, the work followed by the man previous to his arrest is closed. The workingman, the laborer, seldom goes to prison; it is the clerk, the bookkeeper, the salesman, or the professional man who makes up the larger part of our prison population. These men cannot return to their regular work, but they can be taught new work, without expense to the state of installing machinery in the penitentiaries, and without the state coming into conflict with free labor or the organizations of free labor. The law forbids the 'letting out' of the men to any contractor; they can be employed only by the state, and only on the work of road construction. The man who has served his time in a road camp has a job open in a free road camp when he is discharged, and *needs no recommendation to get this job;* the state's word is back of him."

The law was prepared after long conferences with the labor unions on the competition of convict labor with free labor, but the measure was so drawn that the laboring people are protected. Putting the men at work on the state highways eliminates the necessity of employing the convicts within the penitentiary at occupations whose production comes into competition with free labor. The highways constructed by the state with convict labor are in remote sections, in the mountains, away from the centers of free labor. This preliminary work was done by Mr. Alco, before he obtained the approval of the governor. Guards are kept chiefly to maintain discipline, but they are being eliminated from the road-work itself simply by increasing the reward for an escaped convict from fifty to two hundred dollars, and deducting that amount from the pay of all the men in the camp when one escapes. Heretofore, this reward could not be paid to an officer of the law or to another convict. Now it can be paid to either. The result is that the convicts strive to prevent escapes, knowing that the reward comes out of their own pockets; or, if a man escapes, strive to get him back, so that the reward so paid may be turned over to their camp. This plan has worked well.

"The convict has a drawing account to purchase such luxuries as he may desire, but if, after sixty days, his drawing account, including transportation, food, clothing and luxuries, exceeds the amount he has earned, he is sent back to the prison whence he came. The convict himself handles no money, and, aside from the payment of his transportation, clothing and food, his one obligatory expense is the payment to his dependents, if he has any, of a certain sum each month. Dependents resident in California for three years get certain aid from the state and county, ranging from five to ten dollars a child each month. When a convict has such dependents, if they are entitled to state aid, he must pay to them two-thirds of his net earnings. To those dependents who are not eligible for state and county aid, the convict may send up to two-thirds of his net earnings if he so chooses, but this is not obligatory.

This College a Training Camp for Statesmen

Concluded from page 4

covers twenty-eight acres and supports thirty-two collegiate buildings, many of whose walls are adorned with ivy. The student body consists of 575 men and 171 women. The legislature appropriated $100,000 for construction of a woman's dormitory. When this building is completed, the attendance of girls at the school is likely to increase as, at present, most women students are local residents. The love of South Carolinians for their university is revealed by the sacrifice of William D. Melton, president, who gave up one of the most lucrative law practices in the state to give his services to the university. At one time he was president of the South Carolina Bar Association.

South Carolina College had the first library building of any college or university in the United States; it was built in 1840 on the model of Christ Church library at Cambridge. The library was founded in 1805 and in its early history ranked second only to the famous Astor library. It contains many rare books which wealthier institutions may well envy. There are now more than 60 000 volumes altogether, as well as a great mass of unbound material. The files of the bound periodicals of 20,000 volumes are the most extensive in the state.

The resurrection of a beautiful city from the ashes of destruction occasioned by war—such is the story of the ruin and regeneration of Columbia. In the early days, the seats of government of all the colonies were close to the Atlantic seaboard and hence Charleston was the first municipal headquarters of South Carolina. By special act of the General Assembly of 1786, a committee was appointed to survey situations and conditions in the neighborhood of the geographical center of the state with a view to establishing there a capitol. Thus Columbia was born. In those first days of government at Columbia, the chief executive and his immediate suite occupied all the available rooms at the only inn. The senators and representatives obtained lodging at farms and settlers' cabins.

The first state house at Columbia was of wood and was destroyed by the famous fire set by Sherman's soldiers. In 1852 the corner stone for a new $2,000,000 capitol was laid. This building was under construction at the time of the fire and was also damaged. Although not completed, it then ranked as one of the finest buildings in America. After the war the building was completed but not on the elaborate scale of the original designs.

Columbia has 126 manufacturing plants that represent an investment of more than $26,000,000 and employ ten thousand persons. They are the result of the commercial development of the Columbian Canal as power for manufacturing purposes. Columbia's cotton oil annual output involves a yearly average of 400,000 tons of cotton seed. Her five largest cotton mills manufacture annually enough fine cotton goods to stretch one and one-quarter times around the world.

Guggenheim Millions Seek Control of Nitrate

Concluded from page 2

which have given rise to comment, are the following: (The italics are not in the original.)

> "With the exception of one plant, all those in the nitrate region that are in regular operation are built for the Shanks process. At the Delaware Oficina of the Du Pont Nitrate Company, a modification of this, designed by Mr. A. W. Allen and known as the Allen process, has now been in successful use for more than a year. At the Cecelia, Guggenheim Brothers have an experimental plant treating trial lots of caliche by a radically new process.
>
> "The Guggenheim process is more radical in its conception, and to realize its benefits it will be necessary to rebuild entirely and on a large scale. In our judgment, however, it offers the largest promise now in sight for making a satisfactory recovery from caliche of widely varying character, and in particular from the 'borriente' or slime-making varieties that are so troublesome. The conception of the process and the pertinacity that has carried it through the experimental and semi-commercial stages of development must be credited to Mr. E. A. Cappelen Smith, who has been ably assisted by Mr. Paul H. Mayer, Dr. C. L. Burdick, and a staff of scientific and operating experts of some fifteen members.

No Information on Process

> "*FOR business reasons the firm of Guggenheim Brothers, which has financed the venture, is not yet ready to permit discussion of the details of the process,* though in connection with application for British patents and in an interview with Sr. Belisario Diaz Ossa, who examined the process for the Chilean Patent Office, some of the essential steps have been indicated. In essence, what Mr. Smith and his associates undertook to do was to carry over into nitrate treatment the lessons learned in developing the leaching process used on the copper ores at Chuquicamata.
>
> "*Until the firm owning the process finds it possible to give out complete information* * * * * it is sufficient to indicate that in any plans concerning future production account must be taken of the probability of caliche being treated on large scale at costs and with recoveries comparable to those at Chuquicamata. The professional standing of the investigators, their familiarity with Chilean conditions, their previous successes, and the time and patience they have devoted to the work give every reason for confidence in their success.
>
> "Preliminary estimates have been made by us, based upon applying Chuquicamata methods to the treatment of nitrate and raising the recovery to ninety per cent. These indicate that a material reduction of costs could be expected. *While in the absence of details from the owners of the process* these can only be regarded as outside approximations, they may be repeated as indicating the possibilities. * * * * What ability to save ninety per cent, as against sixty-five per cent means as to tonnage in the ground is suggested by recalculation of the results of the examinations of considerable tracts of ground.
>
> "It would seem that every argument points to favor American participation in production of nitrate and the fixing of its price for whatever period the present situation shall obtain. There seems no sound reason to anticipate the finding of important supplies of natural nitrate outside of Chile. A natural monopoly exists in that country, a fact not changeable, and which is fully appreciated by Chileans. Whether or not artificial nitrates can be produced at a price lower than Chilean nitrate can be imported is a question not within the scope of this particular report. If one may judge from what has happened in the case of other nitrate products in the United States, they are not likely to be sold at a lower than the competing price for a considerable period regardless of their cost of production. Until their volume becomes large in proportion to the consumption, and until the higher costs incident to establishment of a new industry be overcome, *it seems likely that in any event the price of Chilean nitrate will continue to fix the price of fixed nitrogen in general in the United States.* If this be so, there is added reason for encouraging rather than discouraging American participation in the Nitrate Producers' Association as a national policy, so as to bring the largest possible measure of influence to bear directly in favor of lower prices. Some reasons exist for thinking that such influence would be from time to time effective. It happens that the better lands, the ones which permit the largest amount of low-cost production, are owned by Chilean companies, which see their advantage in working toward larger output. They can make money at prices below those at which others can thrive, and they naturally want to expand. The German companies, for a variety of reasons, favor lower prices, and if these two interests were backed up by steady insistence of an American group the price set would always be at least as low as circumstances would permit. When the largest buyer stands aside and refuses to enter into price discussion, it is natural for him to lose the benefit of the doubt.
>
> "*So long as the Nitrate Producers' Association maintains its policy of sales at equal price to everyone, it is the best and final protection the American consumer has against a combination in the United States.*"

Process Gives Ninety Per Cent

IT IS an unfortunate fact that financiers feel it necessary to attempt to influence public opinion regarding their industries through the many, devious and complicated ways of modern publicity. The New York News Bureau, a financial news service in Wall Street, which disseminates announcements authorized by the Guggenheims, is accustomed to refer to the Guggenheim Brothers and the American Smelting & Refining Company as "A business family and a family business." It is known to the chemical engineering world that the Guggenheims have developed at their plant at the Oficina Cecelia in Chile, a process by which at least ninety per cent of nitrate may be recovered from caliche instead of the sixty-five per cent now obtained. But a process of this nature is not confined to the Guggenheims alone. A prior improvement is in use at Oficina Delaware of the Du Ponts, known as the Allen process, the originator of which is recognized as the pioneer in introducing into the nitrate industry the bulk-leaching methods of early cyanide practice.

The economical process in use by the Du Ponts at their plant is known, while that of the Guggenheims is a secret. It is regarded as rather astonishing that while the Guggenheims refused to let the two American commissioners, Messrs. Bain and Mulliken, learn their process, yet the latter were enabled to obtain some of the essential details from Sr. Belisario Diaz Ossa, of the Chilean Patent Office.

According to talk among the members of the Chilean Nitrate Producers' Association, the Guggenheims attempted to break into the Chilean nitrate situation back in 1921. They are said to have made a proposition to the Producers' Association which was turned down abruptly. The suggestion was that the producers were to put up $600,000 for an experimental plant, in which they were to have a twenty-five per cent interest, while the Guggenheims were to retain seventy-five per cent in the stock of the venture, and in addition were to charge a royalty amounting to seven pence per hundred pounds of nitrate produced by their process.

Trade Information Bulletin No. 170 is criticized because of an impression it creates that United States Government support has been given to a financial scheme of tremendous magnitude, while at the same time the details of the plan were denied to the American commissioners on their own admission. The report does not discuss all the vital facts regarding the new process, because it makes no mention of any presumable royalty which the Guggenheims may charge for its use. *There is no indication that the American farmer or manufacturer will profit by its adoption. The profits will presumably go to the "business family and the family business."*

Heavy Nitrate Deposits

THE tenor of the report indicates that there is a tremendous amount of nitrate in Chile. A large amount has been wasted heretofore, but this wastage can be stopped through improved methods. The report is very guarded, however, on a presumable reduction in costs. The government had to find out what the future cost of manufacturing nitrate would be so that it could prepare for the probable cost of war nitrate. So it sent to Chile two men from the Bureau of Mines, who reported that the future depended upon improved technical methods, and featured a process developed by the Guggenheims as the ultimate solution of the problem. *But they admittedly supported this process without full knowledge of its details, and in spite of the fact that it has not yet passed the experimental stage.*

Immediately ensuing upon the government report, the announcement was made that the Guggenheims were prepared to launch their project, and that their experimental plant at the Oficina Cecelia, having fulfilled all expectations in having treated 5,000 tons of caliche, would be closed pending the completion of arrangements for introducing the process on an extensive commercial scale.

In nitrate circles it is assumed that the Guggenheims will offer to loan out their profits made in the Chile copper deal to the members of the Nitrate Producers' Association, so that the latter will be able to build new plants, that being a necessity before use can be made of the Guggenheim process. It is estimated that the rebuilding of the plants in Chile may approximate an expenditure of $120,000,000. It is to be presumed naturally that if the production of nitrate is increased some twenty-five per cent, the Guggenheims will demand a royalty that will net them a satisfactory return for capital invested.

The tendency of the report is to gain for the Guggenheim process the approval of the Nitrate Producers' Association, while at the same time recommending an abandonment of the Sherman law in its application to the Chilean nitrate industry, so that American firms can join the association and build plants to operate under the Guggenheim process. The report apparently throws the future development of nitrate into one capitalistic channel, discouraging development in any other direction than in connection with the Guggenheim process, thereby throwing all the possible benefits of financial yield into the hands of this group, and ignoring the fact that it is necessary to adopt a free and impartial consideration of the whole question, which should favor all contemplated improvements equally.

If Chilean nitrate is to dominate the nitrate production of the world, and if all the producers there are to manufacture their product subject to a Guggenheim royalty, a group of financiers will be firmly established in a position where they will exact a toll for generations from every wheat farmer and cotton grower, from every acre of tilled land and every manufacturing plant not only in the United States, but in every portion of the civilized globe.

And more than that: the Guggenheims will control the basic materials of war explosives.

Real Vitality in Irish Co-operative Plans

Concluded from page 6

Both the Ulster Government and the Irish Free State keenly alive to the farmers' needs and their agricultural departments are giving educative assistance and the legislative bodies of both governments are considering laws for the standardization of farm products, such as requirements for grades of butter, inspection of creameries, testing of eggs, and other laws that would put the stamp of approval upon the Irish farm products such as would give it successful entrance into the most competitive markets.

As we left the Irish coast, the picture of the Gombeen Man faded along with the coast line, and I saw the co-operative movement of the Irish farmer rising again, gathering itself up and reaching forth toward the goal set up by Sir Horace Plunkett.

* * *

The survey of the English farmers' co-operative societies led me, on the 27th day of June, to a seat in the gallery of the House of Parliament in London. I had crossed the Irish Sea from Belfast to Glasgow and from that city had journeyed south through towns and communities until I finally reached London.

On that afternoon I decided to listen to the debate which was then going on on the floor of Parliament.

A member from Glasgow was giving figures to show the increased number of deaths in Scotland in comparison with England, due to tuberculosis. He asserted that this was caused by bad housing conditions and the withdrawal of the supply of milk formerly sanctioned under the child welfare schemes through cutting off the funds by the Scottish Board of Health.

At this juncture I became all attention since a large part of my investigation had been in connection with the co-operative handling of milk from the farms. As the speaker proceeded, he became very earnest. He asserted that the majority in Parliament in the interest of economy who had "sent this order" had condemned hundreds of children to death, and he closed with these words:

> "I call the persons who sent that order murderers, and the Honorable gentlemen also who went into the division lobby in favor of that policy are murderers, cold, calloused murderers, with the blood of infants on their hands."

Then followed an extraordinary scene on the floor of that great body. There were shouts of "murderer," and other names; a specific request by the speaker to the member to withdraw the charges; the raising of the massive mace which is the insignia of physical authority, and the placing of it on the table in the presence of the members; the efforts on the part of the Sergeant at Arms to remove the Scottish member and three of his associates, and finally their suspension and retirement from the House of Parliament.

Aside from my astonishment over such utter chaos, the thing that my mind impinged upon was the scarcity of milk and its price.

According to a recent parliamentary report, the per capita milk consumption in England is less than one-half that in the United States. I would not conjecture what answer a person would receive if he were to ask for a drink of milk at the bar of the many "Pubs." It was almost in vain that I scanned the menus in the various restaurants and hotels for the word "milk." When I did find it, there was frequently carried with it a statement that the milk "here sold" contains a certain percentage of preservative.

Here then is a wonderful present and potential market. Moreover, the English farmer, unlike many American and Continental farmers, has his market almost at his door because of the many cities of Great Britain that are close at hand. The soil on which he can feed his cattle is certainly far more fertile than much of the land was which Denmark has restored. From these farms there are excellent roads that lead in every direction. Railroad facilities are splendid though the cost of hauling the milk to the market has been criticized by a committee of Parliament.

Many reasons have been given for the failure of the farmer to co-operate, but the one which is especially emphasized is that the English farmer prides himself on an individualism which he mistakenly understands to mean a "go-it-alone" spirit, and which prevents him from combining in team play with his fellow farmers in the market place. This reason is not sufficient when one considers a situation which cries out for co-operation more strongly than in perhaps any other part of Europe.

I think that Mr. Harold Fabre, the well-known Danish agricultural expert, who is thoroughly versed in English agriculture, has found the cause. In comparing Danish farms with the English, he says that the former are not over two-thirds the size of the English freeholds. Of the total number of agricultural holdings in Denmark, ninety per cent are owned by the farmers themselves, while in England only thirteen per cent are thus owned. It is this complete possession of the soil by the peasant that has been perhaps the greatest incentive to the Dane in co-operation, and it is the want of it that has undoubtedly held back this movement among the farmers of England, even though they have worked under tenancy laws that are considered very good.

Billboards of Nation Angle for Boy Smoker

If He Smokes Before Twenty, Chances Favor His Continuing

By ROY BEDICHEK

BILLBOARDS over the country are angling for the boy. They want him to do his cigaret-smoking early. Statistics show that if a boy begins smoking before he is twenty, he will likely be a good customer of tobacco stores for the remainder of his life. Nearly every normal boy wants to be a man, and he wants to do the thing that a man does. The man who makes up the billboard advertising for cigarets knows this and shrewdly plays upon this boyish ambition. The central figure of the billboard advertising of the cigaret is nine times out of ten a man—a great big, good-natured, smiling, prosperous man. The glow of health is in his cheeks, brawny strength is in his well-set-up shoulders, and his pose is one of commanding ease and distinction. The legend on the billboard is adapted to the understanding of a lad of twelve, is sententious, words of authority apparently from an eminent source. It doesn't argue, it asserts. Calm, well-considered opinion, conviction, is the tone, and absolute assurance is the keynote of these sentences which are intended to stimulate in the boy the desire for a cigaret.

On the surface, it would seem that there is great rivalry among the various brands of cigarets. The virtues of this brand are emphasized on this billboard, while across the street the superlative excellence of another brand is said and sung and pictured. This is all a sham warfare. There is no competition existing, worthy of the name. This bogus competition is merely a stalking horse for the advertiser to get the boy's attention and make a smoker of him. It is immaterial which brand he smokes, but it is quite important for the perpetuation of the profits of the tobacco trust that he smoke some brand or other. The only purpose of all this advertising is to stimulate a desire for smoking in the non-smoker, and since no mature non-smoker can possibly be influenced by either the pictures or the assertions of this tobacco advertising, it is clear that it is aimed directly and solely at the boy. (Some have suggested that it is even the purpose of the tobacco trust to make smokers of our girls as well, but I have seen no evidence of this in the billboard advertising of tobacco.)

Constant association in the mind of any one of two things tends to form the conviction that one of these things is the cause of the other. This psychological principle is well-established. In this case the constant association of health and strength and distinction with smoking cigarets tends to establish in the mind the belief that health, wealth, strength and distinction are attained by smoking cigarets. Insofar as this causal relation is established in the mind of the growing boy, this billboard advertising of the cigaret is a pernicious lie.

I doubt the wisdom of sumptuary laws, even the prohibition of the sale of intoxicating liquors, but it certainly should be against the law to *advertise* anything which is as harmful to the human constitution as cigarets. A flat law making it a misdemeanor to display anywhere in any way, shape or form an advertisement of cigarets would kill the cigaret business in ten years. Such a law could easily be enforced. Incidentally, it would kill the prestige which the tobacco trust now enjoys with the press, and that, in itself, would be a fatal blow to this poisonous business of beguiling boys into doping themselves with nicotine.

Certain high school athletic associations in the United States are taking very effective measures against the cigaret—effective because they are hitting the cigaret where it lives and thrives, that is, with boys from twelve to seventeen years of age.

Athletes Bar Them

THE high school athletic associations of three states in the Union have proscribed the cigaret. The Minnesota State High School Athletic Association has the distinction of being a pioneer in this attack. Eight years ago this high school athletic association adopted the following rule as one item in its list of eligibility requirements:

> "He (the contestant) shall use no tobacco nor intoxicating liquor during any part of the school year."

This rule was later strengthened, and the manner of its enforcement rigidly prescribed.

The North Dakota High School Athletic Association followed suit with the following rule:

> "No student shall be able to participate in any League contest who uses tobacco."

The rule against tobacco in the Kansas State High School Athletic Association is stated as follows:

> "No student who uses tobacco in any form during the season of a sport shall be declared eligible to compete in high school athletic contests in that sport."

An inquiry was sent to representative high school principals and superintendents in each of these three states, Minnesota, North Dakota and Kansas, concerning the effect of this rule. Not one of the fourteen individuals who replied indicated that he would be willing to vote to repeal the rule. M. P. Tobias, superintendent of schools in Northfield, Minnesota, reports:

> "Boys dropped from the team last year for violation of this rule stopped smoking in August to get into condition for football this fall."

Nelson Sauvain, superintendent of schools at Devils Lake, North Dakota, asserts:

> "The tobacco rule in North Dakota has been in force four or five years, and has produced very marked results among the boys participating in athletics over the state."

N. Roberts Ringdahl, superintendent of schools in Dawson, Minnesota, says, in part:

> "I am certain that the rule reduces materially the use of tobacco on the part of high school boys. It influences the boys way down in the grades. I have heard grade boys say, 'I'm not going to smoke because when I get into the high school I want to play basketball.'"

It is the example of the smoking athlete that is so pernicious in the public schools. If the athletes use tobacco at all in states having this rule, they must use it on the sly, and in this case the younger boys do not see them. The small boy, as everyone has observed, is a hero-worshiper, and his hero is usually an athlete. At the baseball game, his highest ambition is to carry the catcher's glove, or hand the bat to the player with a reputation for home runs. In his devotion, he offers to the athlete the only thing that he has to offer, that is, personal service. This touching hero-worship should be turned to account. We should not allow the small boy's idol to appear before him with a cigaret in his mouth or a cud of tobacco in his cheek. If we do, no amount of sermonizing can overcome this convincing example, and the constant and insidious teaching of the billboards.

The deadliest assault that can be made upon the tobacco habit would be to make the advertising of the use of tobacco illegal; barring that, it can be severely crippled by the state high school athletic associations adopting rules similar to those in force in Minnesota, North Dakota and Kansas.

The Balkan Politician Is Not a Lovely Animal

Concluded from page 10

elder generation remembers Bulgaria as the scene of massacres about which Gladstone was eloquent. A few others may remember that Bulgaria was among those who fought with the Central Powers in the Great War—although the United States never declared war against Bulgaria. Druggists and chemists know Bulgaria as the place whence comes the attar of roses; there is a whole valley—the famous "Valley of the Roses"—given up to the growing of roses. Most of the natural rose perfume of the world is from this valley; the remainder grows in the vats of the German chemists.

The Brigands of Sofia

ANYONE getting off the train at Sofia for the first time is due for a shock if he has the brigand idea in mind. He will find in the first public square at least thirty brigands squatting on low stools—regular opera brigands. Their weapons are tin boxes and bottles and brushes ranged in neat cabinets and they are on hand not to rob you but to polish your shoes for the equivalent of something less than half a cent! What they find to do with their various kinds of polishes I cannot imagine. But the appearance of his polishing case is the biggest thing in a brigand's life. The real Bulgarian brigand is a myth.

More than ninety per cent of all the Bulgarians are farmers. They wear national costumes varied according to the section from which they hail. The usual dress is a heavy brown or white woolen one-piece suit with great baggy trousers that come down, something like riding breeches, into a complicated crisscrossing and winding of rawhide thongs which serve to hold on a sort of moccasin. Round the waist is a big red or brown sash which will often have in it thirty yards of material. This is worn day and night, winter and summer, and the great unsolved mystery of the Balkans is how the peasants wear such clothes with the thermometer well above ninety—as often it is. Yet they not only wear them but often add a sheepskin coat with the wool side turned in. Probably they feel safer with all their clothing on their backs. The cap is a round visorless affair of wool in white or black. The sash is more useful than it seems; in the first place it is a protection for the stomach—even Occidentals in these hot countries often wear woolen bands—and also it is a general pocket, holding food, a knife or two, and, in the older days, a big pistol. The men seldom go barefoot but the women, excepting in winter and for fêtes, always do. The women wear a kind of white muslin under-dress with sleeves; over this they have a sleeveless black woolen jumper shorter than the white dress and fringed at the bottom. All the women, regardless of age, braid their hair into two pigtails which they let hang from under the kerchief which they tie about their heads. It is a sort of dressing which seems to make for convenience. At a railway station near the Greek border I noticed a blanket carefully spread over something on the earthen platform; near it was a collection of what appeared to be household goods tied in great bundles. I wondered what was under the blanket. A few moments later a peasant came along and gave the blanket a slight kick; then out from under it came a pigtailed head, and then another, and still another, until a mother and five daughters were standing up rubbing their eyes and blinking in the sunlight; then each in turn gave herself a shake and the party was dressed for the day! They had no use for powder puffs or combs.

These Bulgarian peasants are a likable lot; they are among the hardest-working people in the world and they can manage under almost any circumstances. And it is well that they can, for while ninety per cent of the people are peasants and devote themselves to work, the ten per cent who are not peasants devote themselves to politics and war. The Bulgarian peasant has always been able to exist, not because of his government, but in spite of it. He has been whipsawed and led into war since time immemorial. The country has always been so rich that the political ring controlling could find its own money and money for war out of export and income taxes without bothering the peasant to pay a tax. They only ask him now and again to go out and get killed and this to the peasant has never seemed much of a request because it is what he expects.

The war did not get into Bulgaria but the peace did. The country was overrun with commissions and committees of the Allies. Every Allied power in the war excepting the United States had a big delegation at Sofia at Bulgarian expense. Even the Japs were on hand and the Nippon representative brought fame to himself by insisting that the Bulgarian government find him a first-class piano for his sitting room. He got it and then he wanted it tuned! Nearly all of us know something of the immense delegations which flocked to Paris to make peace, but few realize that similar delegations flocked to every enemy capital and established themselves in whatever state of regality the country afforded. The Allies did not get around to making the Bulgarian treaty until 1920; then they made a treaty which was so outrageous that no one could give it serious attention. It was followed by another treaty which Turkey broke up, and only a little while ago, after a long series of conferences at Lausanne, was peace finally made. In the meantime, the Reparations Commission which has been sitting all the while at Sofia costs the government just about the deficit in its budget!

The country is flat broke as a country but the peasant manages. The peasant buys almost nothing at any time; his wife and daughters make all the family's clothing and they live on the produce of the farm. The peasant is not often in the market for anything other than agricultural machinery. He gets his live stock by trading. In some parts of the country he appreciates the value of machinery but only when he can buy in connection with a group of farmers, for the holdings are too small to warrant an individual making a heavy purchase. I saw farmers plowing with modern plows behind teams of buffaloes and also I saw them plowing with wooden shares rudely sheathed with iron—just as they had done two hundred years ago. I saw a modern threshing machine and also I saw flails. The Bulgarian peasant has learned how to make out with what he has and to get enough to eat regardless of what is going on.

City Folk Hurt Most

IT IS the city people who have been most hurt, but even they are getting enough to eat, for living is very cheap. Years ago, when I was first in the country, it cost almost nothing to live; then a hotel room might be had for ten cents a night. It was not much of a room but it was the best the place afforded. It was hard to spend more than twenty-five cents on a meal and the housewife in buying food reckoned always in stotinki, which are the one-hundredth parts of a lev (that is, normally, one one-hundredth of 19.3 cents, or about two-tenths of a cent). The hotels have vastly improved since those days and their prices have gone up, but for the best room in the best hotel in Sofia I paid only $2.21 a night for two persons and that with a bath attached. Prices of foodstuffs reckoned on the paper leva are from twenty to thirty times what they were before the war, but wages have increased slightly more than that so the cost of living has not greatly increased excepting on paper. Clothing and all imported goods are away up; the stuff is mostly German and of very poor quality, but the prices are as high or higher than those of the United States for better quality. In food Bulgaria is rich but in all articles which have to be brought from abroad she is very poor. The railways, for instance, had to give most of their best engines and cars to Serbia after the war and they have not been able to buy new ones. The sidings are full of worn-out cars and engines—just outside of Sofia I saw a German war train of perhaps a hundred cars rotting in a meadow. The engines in actual use will just run and that is all. The roadbeds and rails are in terrible condition and it is rare to have a train do better than twenty miles an hour for more than a short distance. We were held up in Sofia for nine hours by a derailment which any American road could have cleared in an hour.

Bulgaria had no industry to be destroyed by war. The country lost many men but the principal loss was in the defaulting of the medium of exchange. But just the other day a good portion of the tobacco crop was sold to Austria for dollars while there is some trading between Bulgaria and Italy in lire and leva. If only the nation had a short vacation from its politicians it would shortly be in shape again—for the stuff is there.

BRIEFLY TOLD

The boxer's kiss has been placed under ban in France by an official decree ordering its abolition. It has been the custom for two fighters to exchange kisses—one on each cheek—at the conclusion of a ring battle.

"The coming of 4,000,000 Jews to this country has created for America problems of the most perplexing kind—social, political, national, financial, humanitarian, religious . . . . Until we find some way to break down their prejudices the evangelization of America will proceed with faltering steps."—*Report of the Home Missions Council, at Atlantic City, January 14.*

A woman in London created a sensation in the ballroom of the Savoy Hotel by appearing with hair that glowed with phosphoric iridescence when the lights were dimmed.

A large gyro-electric plant in Searsburg, Vermont, located far in the wilderness, regulates itself without human aid. It is wholly automatic in control and if serious trouble arises in its mechanism, it shuts down and stays shut down until experts make things right again. It has a capacity of 6,500 horse power.

Thirty-seven per cent of all automobiles in Canada are owned by farmers.

The old Pullman car fish-net hammock is being replaced in the new cars with a rack designed to occupy the same position above the berth as did the hammock. The rack will hold clothing flat and prevent wrinkling. It is made in skeleton form of one-inch green belting and is fastened to either end of the berth by hooks. It folds back flat when not in use.

The total 1923 pack of canned salmon for British Columbia will give the packers of that province more than $10,000,000 if all the cases are marketed at the ruling prices.

When a Senator boards an elevator in the Capitol it must not be stopped for other passengers until the Senator gets off.

The British Ambassador at Washington has a salary just over $12,000, but in addition he has a completely appointed embassy at his disposal and an allowance of more than $85,000, thus totaling $97,350. The American Ambassador at London has a salary of $17,500, and in addition he must pay for the upkeep of the embassy from his private pocket.

Of every thousand boys and girls entering high school, five hundred sixty-one leave before the end of the fourth year.

The three-mile limit is generally but not universally accepted among the various nations of the earth. Spain claims six miles, Norway four, Sweden four. Both Italy and France have insisted that their neutrality in case of war should be respected within six miles of the coast. The Institute of International Law has voted in favor of the six-mile limit.

J. Ramsay Macdonald, British Prime Minister, is a straphanger, riding to his office in crowded trains.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Prunes will soon be dried by electricity instead of by the present sun-drying process, according to a California agricultural expert.

With the thinning of the forest the old-time lumberjack, picturesque, uncouth, but manly, is going the way of the cowpuncher and prospector. Woodsmen now demand—and get—the comforts of civilization. Electric lights and radio sets are installed in many camps.

"The Founders of the American Theater," limited to 100 members, is being formed in New York to stimulate native American drama by producing plays written and acted by Americans.

Crop acreage in Canada has almost trebled since 1900. This is a larger area than England and Wales combined.

The tomb of Virgil is to be purchased by the government of Italy. The surrounding plot, transformed into a garden of the Greco-Roman style, with laurel, myrtle and roses, will become a shrine for lovers of the poet.

William Hohenzollern is becoming more congenial with his fellow-townsmen in Doorn, according to reports. He visits the village more frequently and receives many visitors.

Less than two per cent of the 30,000 boys and girls from the Dr. Barnardo's Homes in England, who have been sent to Canada and Australia have been failures. These children come from the most densely crowded and destitute area of the United Kingdom, and every one was a castaway until rescued.

The story that has long been current in San Jose, that Mrs. Mary Baker Eddy visited "The Spirit House" of the late Sarah L. Winchester in that city, is denied on the ground that Mrs. Eddy never traveled farther west than Chicago. Yet the San Jose story persists, is generally believed, and frequently printed.

Prohibition agents are not, as a rule, prohibitionists. Many of them drink liquor, to obtain evidence. Last year they spent $205,658 of government funds in buying drinks.

"We know America's difficulties; we respect America's suspicions. The American people are drawn from many diverse sources. They have crossed the Atlantic with many bitter memories in their hearts . . . . They have no intention of allowing the mighty state which they have done their full share in building up to become an adjunct to any European Power or to get mixed up in the diplomatic confusions and nationalist ambitions of European policy." *J. Ramsay Macdonald, head of the British Labor Party in Parliament.*

Aroused by the increase in advertising billboards which spoiled vistas of mountain and turquoise sea, the women of Honolulu notified the merchants of the Hawaiian Islands that they would purchase no goods so advertised on the island of Oahu. Today there is not a single advertising billboard on the island.

Fort Cralo, where the British Army surgeon, R. Schukbury, wrote "Yankee Doodle" to poke fun at the American colonists, the old historical fort at Rensselaer, New York, may be preserved as a Revolutionary relic. It was built in 1642.

Disguised as a Chinese coolie, William M. McGovern, American, acting for the British Government, entered the mystic capital of Tibet, Lhassa, and for two months photographed and recorded the peculiarities of its 2,000,000 inhabitants.

For the first time in the history of winter seasons in Alaska the tide of travel on the Alaska Railroad has been inbound into the interior instead of outbound.

The largest electric light bulb in the world was recently exhibited in East Orange, New Jersey, at the plant of the General Electric Company. It is 22 inches high with a diameter of 15 inches at the top. Thirty thousand watts were required to heat it.

International boxing matches as a substitute for war were advocated by the Duchess of Hamilton. In the old days of the Vikings, tribal disputes were settled by fights between picked men.

The burning qualities of tobacco are tested by a machine which puffs cigars in human fashion, using air suction in the process.

Three thousand Doukhobors from Saskatchewan are preparing to emigrate to Russia, where they will settle in Crimea. The Soviet government provides the land and improvements in return for one-sixth of their crops.

CHRONICLER OF THE NEGLECTED TRUTH

Borrow Life From the Goat? Transplanters Cause New Charlatanism to Flourish

By ROBERT MORGAN

The Best He Gets Is the Worst of It

Full-grown male Toggenburg goat, of the size, age and variety most in demand by the "gland transplanters."

THE United States today is overpopulated with miracle-workers, fakers, quacks, charlatans, inventors of new cults in everything from astrology to zoogeny, and back again.

The alchemists of the Dark Ages were less numerous, less clamorous, less harmful, and infinitely less zealous in their search for gold than the Steinachs and the Voronoffs of today.

Humanity has advanced in almost every way since the days of Hermes Trismegistos, save in gullibility; we are as quick to buy bottles fresh filled from the magical mythical fountain of youth as our ancestors were to buy the philosopher's stone in the days of Roger Bacon.

By the use of radium we have produced helium, in itself an element, thus destroying the theory of transmutation on which virtually all the charlatanry of the thousand centuries preceding the eighteenth was based.

Yet every year there rises some new messiah, who finds ready to his call, and accepting his wildest claims, droves of followers greater in number than the population of the entire world when Geber came out of Asia to astonish Europe with his now laughable pretensions.

This year we have with us a troupe of "gland experts"—not those hard-working scientists who, delving with needle points into cellular life, are trying to learn how much of man's well-being depends on the proper functioning of the glands within the body, but those who propose to replace worn-out parts of the human anatomy with new parts from the lower animals. The advertising of these modern Ponce de Leons fills pages of our newspapers and magazines. The majority of the miracle-workers are disguised as incorporated laboratories. A very few are physicians and surgeons whose records will bear searching. A small percentage are men who have worked for years to obtain their diplomas from established and reputable schools of medicine, but the vastly larger number are graduates of correspondence schools, holders of degrees from "diploma mills," chiropractors, metaphysical healers, and others, who, with a smattering of medicine, and less knowledge of surgery, promise to the gullible public the working of such miracles as not even Albertus Magnus would have dared to offer.

The writer has spent a great deal of time during the past two years in studying the work and the records of the "gland therapists." He has discussed methods, theories and results with a dozen of the leading exponents of gland therapy, and with three times this number of chemists, physicians, surgeons, and laboratory research workers who, today, through county, state and national organizations, are demanding definite proof from the gland therapists of the worth of their methods and of the results of their operations. It is the purpose of the writer in this article to tell as nearly as can be told in a publication of general circulation, just what the gland "operators," as they are called, claim to have accomplished, and how they claim to have attained these results. In a second article, theories, arguments, tests and experiments, which leading physicians, surgeons and research workers declare prove these gland operations sheer humbug, will be presented.

The gland theory is based on the work of Theophile de Bordeu, a French physician, who, in 1778, expressed the idea that certain glands within the body exude tremendously important secretions into the blood. Physicians today enumerate these glands of internal secretion—as differing from those of external secretions—under the general name of "endocrine glands," or merely "endocrines." The word "hormone" also has been coined in rather recent years, to mean the secretions of the endocrine glands. These endocrines are seven in number, so closely connected, and admitted by all save the gland therapists to be so mysterious in their operations, that it is necessary, before discussing them, to enumerate and describe them. They are:

The thyroid gland, located in the neck, just above the windpipe, with four tiny parathyroid glands surrounding it. Its secretion is *supposed* to control the growth of certain organs and tissues affecting the brain and sex, and is known as thyroxin.

The pituitary gland, at the base of the brain behind the nose, double in form, anterior and posterior halves. The secretion of the anterior (forward) half is unidentified and unnamed. The rearward half of the gland secretes a hormone known as pituitrin. It is *supposed* to tone the nerve cells, and to assist in the support of continued effort.

The suprarenal glands, each double and each set above each one of the kidneys. The secretion of these glands is called *adrenalin.* It is in common use as a stimulant for the kidneys, and is a well-established remedy for the terrible Bright's Disease, once believed to be incurable.

The pineal gland, above and behind the pituitary gland. Its secretion is unnamed and not well known, but is believed to have something to do with the development of the brain and with the sexual age of the human being.

The thymus gland, in the chest, giving out an unnamed and not well-known secretion, which is concerned in the development of childhood, to the extent that, when absent, or destroyed, the child develops mature appearance and attributes almost at once.

The pancreatic glands, in the abdomen, close to the "solar plexus." The secretion of this gland has been only recently discovered, is known as insulin, and has proved of value in the treatment of diabetes.

The interstitial or life-producing glands. These have the interesting double function of both external and internal secretion, the external being reproductive cells, and the internal a little-known secretion which builds up body tissue, and, in all probability, also supplies hormones to other glands in cases of the debility of any one of them.

These things are *known* about the glands. They are admitted to be true by virtually all physicians and surgeons, as well as laboratory workers. In discussing the claims of the gland operators, fortunately, the question of mental healing, metaphysical treatments, or auto-suggestion do not enter, except as side issues. We are on the straight lines of medicine and surgery. When the above knowledge of the endocrines is accepted as a base, the gland therapists go a step further. They say, with the established science of medicine that "a man is as old as his glands," but to this they add, "and a man's glands are as old as his sex glands."

The gland therapists—though they differ as to methods—unite in the claim that the replacement of the powers of the interstitial, the life-producing glands, will work, without further operation, a similar replacement of the powers of the other six endocrines. This is by no means proved; it is merely stated here as a fundamental principle of the gland therapy school. Beyond this, the gland therapists divide on methods of the presentation to man, or woman, of essentials of the life-producing glands. Some, led by Steinach, of Vienna, and Voronoff, of Russia, ably seconded by one J. R. Brinkley, of the United States, claim to obtain the result by the transplantation of the complete interstitial gland from a monkey or a goat, to the human being.

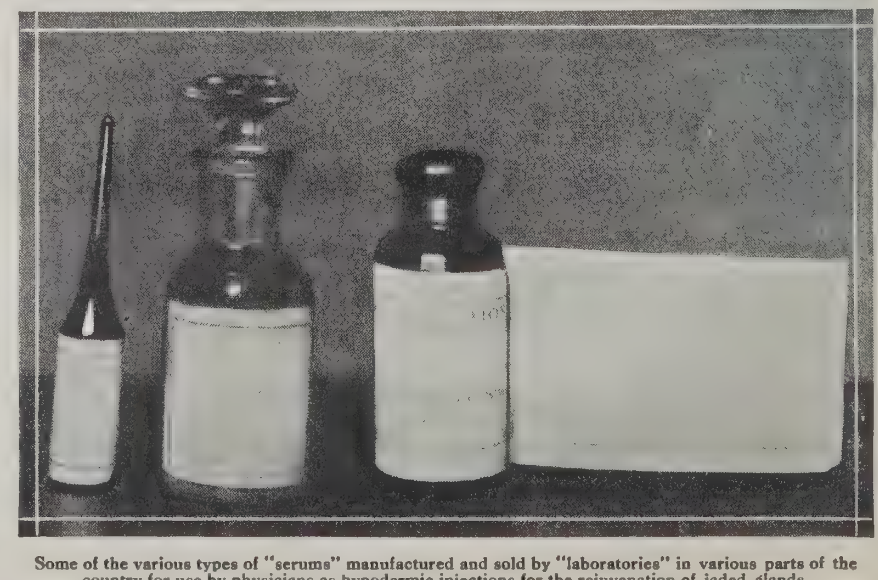
It can be said for this method that it is fairly well established that such transplantation of living tissue from an animal to a human being can be accomplished with success to this degree that the tissue continues to grow, for a brief period at least, amid its new and human surroundings. The effect of such transplantation on the human being will be discussed later; the result for the monkey or the goat is unfortunate, to say the least, but hardly less so than that for the man or woman at the receiving end of the "operation."

A second school of gland therapists—and the one which is growing most rapidly because it has the easiest way to separate confiding humanity from its money—claims to be able to accomplish the same results by injections, into the fatty tissues of the outer wall of the abdomen, of a serum obtained from the interstitiary glands of the monkey or the goat. This is simpler, involves no operation and no prolonged stay in the hospital; in fact, most of these goat-serum injection fakers have no hospitals; they are moving too fast to escape the law just now to care to invest much of the money they have extracted from their "patients" in insoluble assets. The obvious danger from this "vaccination against senility" is the ever-present promise of resulting peritonitis or other form of poisoning. Of that, more later.

The third, and last, to date, of the divisions of the gland therapists, consists of those who supply us with pills, tablets, capsules, or what you will, containing the "essential extracts" of the life-producing glands of Billy or Nanny Goat, the one for Billy Man, and the other for Nanny Woman. So long as these pillsters, who are reaching millions of aged men and women with their page advertisements in the newspapers and magazines, keep morphine and other drugs out of their pills, they probably do no harm, other than robbery, and the occasional poisoning of a patient by unclean foreign matter rolled up into the pellet of chalk, glycerin and goat lymph sent out in return for the cash in advance of humbugged humanity.

The promises of all three schools of gland therapists are alike in point of results claimed. At first some of them, notably the transplanters of the actual glands, claimed to be getting these endocrines from monkeys, but now all three are united on the goat, and all three also have selected the unfortunate Toggenburg as the particular variety of goat whose interstitial glands are the best adapted to introduction into human anatomy. The majority of these operators claim, furthermore, to be breeding their own goats so as to insure pure-blooded animals, clean surroundings and properly prepared serum. So far as the medical associations of several states have been able to learn, there is not one of these gland therapists who is maintaining such a goat farm. Without exception, these gland-transplanters, gland-injectors and gland pill makers, are getting the glands on which they base their surgery, vaccine or capsules from the nearest slaughterhouse. Obviously this source is a long way from being able to furnish materials which are either physically clean or chemically pure.

The most remarkable factor in the whole goat-gland craze, which has risen to its present stage of wide popularity and profitable practice in the past five years, and has not even yet reached its limit, is the ease with which those physicians who have taken it up can conceal their lack of proper or adequate medical or surgical training. Take, for example, the dean of the cult in the United States, one J. R. Brinkley, M. D., of Chicago; Milford, Kansas; Los Angeles and San Diego, California; Ensenada, Lower California, and now of China or Egypt, his whereabouts being not well known to interested Federal and state officials. Brinkley is the leader, the absolute dean of the gland-transplanters. He has deprived more goats of life, and collected more money from elderly men and women, in return for the transplantation of goat glands than any other man who has taken up this line of surgery. Yet he was peremptorily refused a license to practice medicine in California, by the Board of State Medical Examiners, because of insufficient and inadequate training in the practice of his profession. Brinkley never was able to explain to the California board, and to boards in several other states as well, just how he came into possession of diplomas



Some of the various types of "serums" manufactured and sold by "laboratories" in various parts of the country for use by physicians as hypodermic injections for the rejuvenation of jaded glands.

"Black Oxen" Author Hears How It Is Done

Dr. Clayton E. Wheeler, an exponent of "goat-gland therapy," explaining the operation to Mrs. Gertrude Atherton, author of "Black Oxen," a book which most physicians consider the most misleading and ill-founded publication of the last hundred years.

from certain medical schools. Brinkley not only adopted the Steinach-Voronoff method of extracting money from men and women, but he improved on it, to such an extent that he wrote a book about it, published in Chicago, in 1922. In this book, Brinkley, speaking as the leader of all gland therapists in this country, makes the following claims as to gland transplantation:

First, that all diseases are curable by it.

One must credit him with intending to except broken bones and epidemic diseases, as he probably intended to do. Even at that, this statement is sheer bunkum. All diseases are not curable; in fact, few diseases, if allowed to run beyond a certain stage, can be cured; many diseases, if taken at an early period in their histories, can be at least stopped. These are axioms of the medical profession, whose truth is demonstrated day after day and every day in every hospital and in the office of every physician and surgeon in this and other countries.

Second, says the dean of the gland therapists, "the source of all human energy is sex energy," which is another way of saying that the gland system of man is a chained system, mutually assisting or depressing each other by their secretions, with the life-producing glands dominating all the rest.

Third, he claims to have cured locomotor ataxia, epilepsy, diabetes, nephritis, dementia praecox, other forms of insanity, paralysis agitans (shaking palsy), and even to have relieved the loneliness of childless homes. If these claims were true, Dr. Brinkley would hold in his hands the remedy for at least half the divorces sought and obtained in this country; he could with a series of operations empty our insane asylums and our homes for the feeble-minded; and it would be only a question of time until our reformatory institutions would have to yield to the able doctor and a herd of goats.

In connection with these claims, it is interesting to note that all the gland therapists, like the ERA practitioners, the spectro-chrome therapists, and the notorious "specialists" of a decade ago from whom these modern cultists directly descend, seek to cure only those diseases to be healed of which men and women will pay the largest sums most readily. The lowest price for a package of "goat-gland pills" from one of these so-called laboratories, is five dollars, and at least twenty packages are required to effect a cure. The lowest charge for a gland transplantation operation yet recorded is $500, and from that the fees range to the $5,000 collected from one wealthy American recently in Vienna. The minimum collection for the practitioner in the injection school of gland therapy is $75; the highest fee collected for such a "treatment" so far recorded is $1,000. To make this financial record complete, it should be added that the current quotation on goat glands in the slaughterhouses of this country at the present time is one dollar each, with a discount on quantity sales.

The school of injectors of serum extracted from the goat gland is an outgrowth of the transplantation system, and the goat-gland-pill medication method followed the hypodermic therapy. A Dr. L. L. Stanley, prison physician at San Quentin penitentiary, in California, set the medical world by the ears a few months ago with the announcement that he had materially improved certain aged prisoners by the use of the serum from goat glands. Since Dr. Stanley is a physician of good repute, and since the secretions of some of the internal glands of the human body have been in successful use for some time in the treatment of certain glands in the body—notably adrenalin for the kidneys—Stanley's work was considered in the light of worth-while experiment by the reputable physicians of the state. The only test for any new method of medication or surgery is time, and this test is now being applied to Dr. Stanley's alleged discovery.

Almost immediately following Dr. Stanley's announcement, however, there stepped into the limelight one Dr. Clayton E. Wheeler, of San Francisco, announcing the establishment of a "free gland clinic," and claiming close working arrangement with Dr. Stanley. The latter at once repudiated such relationship, and one of the newspapers of San Francisco started an exposé of the "free clinic," demonstrating that it was far from free. This newspaper, however, through some influence not yet explained, lost its good intentions the day after the exposé was commenced, and dropped the entire matter. Dr. Wheeler occupies the same position of leadership with respect to the injection school of gland therapists that Dr. Brinkley does, or did before he left for China and Egypt, with the transplantation school.

The treatment consists of two injections of about one ounce each, of serum prepared from the interstitiary glands of a male goat if the treatment be for men, and from the similar glands of a female goat, if the patient be a woman. It is worth noting here that the records of several state medical associations show that women exceed men, in the proportion of about three to one, as patients of these gland-injection operators. The men exceed the women in about the same proportion in the gland-transplantation "clinics," while it is impossible to arrive at the number of individuals or the proportions of the sexes taking the "mail-order" treatment of pills and capsules. It should be said also that all three schools of gland therapy promise the same results to men and women indiscriminately. Apparently the elderly zippers who desire to be returned to flapperhood prefer the needle to the knife, while the hopeful Lotharios in their seventies care not by what means they may be rehabilitated into modern sheiks, so long as they get there before the undertaker overtakes them.

One of the apparent reasons for the large attendance of women at these gland-injection clinics, and their probably equally large participation in the national dosage of goat-gland pills, is the wide circulation of a book written by an elderly woman within the past year, and the further dissemination of its doctrines on the screen. The book is called "Black Oxen," and was written by Gertrude Atherton, to whom, by the way, the above-mentioned Dr. Wheeler dedicated his "free gland clinic" when it was opened in San Francisco. According to physicians and surgeons of established reputation, and to leaders in organizations of medical men throughout this country, the statements in this book not only are misleading, but are not true to established facts.

Added to the influence of this book, which is written without regard to known medical or surgical principles, is the further condition that, in this day of the excess of unmarried, or "unattached" women over men in this and other countries, it becomes incumbent on the elderly married woman—at least in her own opinion—to hold fast to the husband whom she won in her youth. This may have the sound of an attempt at a joke, but in the opinion of physicians and of the managements of hospitals to which these unfortunate old women have been forced to appeal for relief from the ills brought on by these gland treatments, it is a very sad and serious fact. There is literally no end to the dangerous complications which may, and in most cases do, follow the introduction into the human body of foreign animal substances, whether by transplantation, injection, or in the form of pills and pellets.

Elderly women desiring to repeat the conquests of their youth form the majority of the victims of the "gland therapists." Here is an invitation to a meeting for women only, held by a physician whose activities are under fire from his state medical association.

In fact, it is the majority opinion of the well-grounded medical fraternity of this country that there never has been an instance of *permanent* benefit from any treatment of any kind involving as the source of the medication the interstitiary glands of any animal. It is equally believed that, in the majority of such cases, there has been a dangerous, if not fatal, after-effect to the patient, so damaging that the man or woman involved very soon found himself or herself in worse condition than before submitting to the ministrations of the gland therapist.

There are today approximately 750 men, physicians, surgeons, chiropractors, and mental and religious healers, engaged in administering some one of the three described forms of gland treatment in the United States. Though the system of gland transplantation originated in Europe, the methods of injection and internal dosage were devised in the United States. None of these systems has developed so rapidly, spread so widely, or gained so much money for its operators in Europe as in the United States. One of the American gland therapists boasts, and in this he probably is telling the truth, that, in the three years prior to 1923, he performed 1,500 gland transplantation operations!

The active growth of the goat-gland school of medication and surgery in this country covers approximately five years, though some of this work was done prior to that period. For certain well-known conditions which cannot be discussed here, operations kindred to these have been performed by well-trained and reputable physicians for more than a quarter of a century. But, in all that time, the number so performed by all the thousands of surgeons in the United States has not equaled the number performed in three years by one gland therapist who was so poorly grounded in medicine and surgery that he has been unable to find but one state which will permit him to practice within its borders.

The gland therapists claim, advertise and accept large fees for three alleged accomplishments:

First, the permanent cure of all diseases.

Second, the restoration of full mental, physical and life-reproducing powers to men and women of any age.

Third, the prolongation of life indefinitely by repetition of the operation at certain definitely stated periods following the first operation.

One cannot but be moved to marvel at these discoveries made in the majority by mail-order graduates of moribund or defunct medical "colleges," within the past half a decade, the while our tremendous laboratories and our far-flung research foundations wander dumbly on, apparently blind to the amazing fact that from the humble goat we may borrow life eternal!

In a succeeding article, Mr. Morgan will present the facts with which the well-trained and reputable physicians and surgeons of the world base their declaration that gland therapy is a fraud.

What They Tell on the Road From Mecca

The Mohammedan Revival Against the Christian World: Political Consolidation for New War Upon White Nations

The writer of this article has spent fourteen years in Moslem lands between Nigeria, West Africa, and Rangoon, Burma. He is an Arabic scholar, well known to many leading Moslems.

THERE has been held at Mecca a congress upon which has been directed from a distance the somewhat anxious attention of many skilled observers representing Powers in Europe. The Pan-Arab Congress obtained but little notice in the general press of the world, the exclusiveness of the meeting-place, the shrine city of Mohammedanism, probably accounting for the fact that the proceedings of the congress were practically unreported, save for a brief intimation that its parting act was to declare for the "full freedom of all Arab countries."

Probably the most impressive aspect of the congress was the further evidence it afforded of the emergence of a new era in the realm of Mohammedanism. With that aspect of the amazing assembly which converged upon Mecca during recent weeks it is the purpose of this article to deal; and if in these notes less account is taken of the religious than of the political side of the movement represented by that meeting, the reason is that while in Mohammedanism as a religion we have a force known and possibly gauged, in Mohammedanism as a political factor, vibrant with enthusiasm, responding to closer organization, animated by a new intelligence which is wide-awake to modern methods in the application of political strength, we have a power of tremendous possibilities, new in its present phase.

What "Pan-Arab" Signifies

THE description "Pan-Arab" is rather modest and restricted as applied to the congress. In point of fact it was a wonderful gathering which straggled into Mecca from territories in extent three times the size of the United States; and the dangers and toils of the journeys thither made by those zealous representatives of Moslem peoples who, with potential supporters, number four times the population of America, would make such a tale as could be read with profit by all interested in the forces that in these days are shaping the world. "Pan-Islamic," rather than "Pan-Arabic," describes the congress, the hardy units of which are now scattering far and wide upon myriad routes, exulting in the light now blazing upon the Green Banner of Islam, carrying a message of which the full purport will be made plain in the coming years, and conscious of a power hitherto unrealized to the utmost.

Yet "Pan-Arab" is a term of no slight significance to the Arab and the offshoots of the Arab. In territorial claims it includes all that North Africa which stretches from Cape Verde to Cape Guardafui; and a line from Ceuta, opposite Gibraltar, to Mozambique, would pass at most points through lands which the Arab and his cousins once held, albeit rather casually here and there, while a similar line from Port Said to the Congo would touch regions which he would not regard as out with his purview on the score of old-time power. There was very little of North Africa, or of all Africa north of the equator, which the Arab did not wander over in the days before he was a vendor of slaves to the Whites: for upon the trade in human beings and on the shoulders of the shackled burden-bearers Timbuktu had risen to the status of a metropolis before the first White as we recognize him had purchased his first Black; and Zanzibar was "a port of pride" in the slave traffic before Vasco da Gama rounded the Cape of Good Hope. The mere recital of the names of the territories from which came chosen men to the congress should suffice not only to indicate its great scope in one respect, but to explain the anxious interest of some of the Powers. From Turkey, once again in the vanguard of the legions of the prophet, came representatives, and the halo of military and diplomatic victory was over them. Mesopotamia—the designation "Iraq" still sounds unfamiliar—and Arabia were in strength. Algeria, Morocco, Tunis, Tripoli, the borders of Senegal, the Nigerias, Bornu, Wadai, Darfour, Egypt, the Sudan, and all East Africa from Port Said to Mozambique will receive in due time the inspiration and the instruction gained at the meeting by their representatives. The message will go not only to Ceylon and India, but over to the Straits Settlements and to the chief places of the islands from Singapore to Java, for all had men at Mecca.

Mohammedans Are Unified

NO GOOD purpose would be served by avoidance of the significance of this extraordinary gathering. Information is available which appears to indicate that the somewhat windy published declaration "for the full freedom of all Arab countries" by no means expresses the whole mind of the congress nor gives the main lines of its deliberations. The talk of the returning delegates suggests something even more important. To minds experienced in this particular field the position in its blunt verity is that Mohammedanism—reawakened, revived, reinspired, if you will—has met in circumstances of great moment to shape its course, and that at this moment there is being borne to every corner of the wide regions of Moslem influence the outlines of a policy, supported by a great example of success achieved. From uplifted zealots, fresh from the stimulus of the gathering at Mecca, it could be learned that a new Church-Militant has arisen in the world; and the statement permits of no offhand dismissal. Yet the True Believer will hurl himself no more in wild fervor upon the bayonets! He has approved a new warfare, of which long ago the wily Turk discovered the method and the value.

From those same zealots could be heard again—as may be heard at any time wherever Mohammedans gather, and far, far from Mecca—the large claims that Mohammedanism is the only undivided religion in the world, that it is the most aggressive and most unifying religious force known today, and the only movement of a religious nature which is gaining in numerical strength at the present time; large claims, indeed, and urged with grim conviction. Examination of them, so far from disposing of them, finds them instead blooming still large and apparently unshaken. And it is this mighty religious force which is now being directed, to an extent never before possible or attempted, on definite and modern lines. Of course, no true Mohammedan will admit that Mohammedanism as a religion ever required a reawakening or revival. That may be so. The writer has known thousands of the followers of the Prophet in, and on the frontiers of, the most remote pagan lands of the world, and wherever there was one Mohammedan there was an indefatigable missionary of Mohammedanism. There was frank acknowledgment, however, that for some time the impulse of leadership had been lacking. The Mohammedan is rejoicing now that not only has the Moslem world found leadership, but proved it well. The proof has been given with especial clearness in the political field. It is a Church-Political that is now to disseminate throughout its scattered millions a theory of fighting new to the bulk of them, or hitherto despised by them: the use of the political arm.

To the Christian world there can be but little satisfaction in an outline of the circumstances which have led up to and attended the revival of Mohammedanism in the sense which has been indicated. It is necessary, however, to give such an outline, and to present it wholly from the Mohammedan point of view. The Moslem recounts with pleasure his success in diplomacy when the Turk succeeded—thanks to France, he admits—in dividing the Allies by the Treaty of Angora. He was somewhat surprised by that success, and he declines to accept the view that jealousy of Britain actuated France in that matter. Rather does he ascribe France's sudden friendship to his own great strength in Morocco and elsewhere in North Africa, and to his influence among the tens of thousands of black soldiers in and around Senegal whom France trained and armed for the Great War, and who now constitute a dangerous element to the ruling power. In short, he believes France to be afraid of the military monster which she has created in the regions about the headwaters of the Niger. Victory in war was added to the sum of Moslem power when Turkey signally defeated Greece. Further impetus was contributed to the revival by Britain, when she set up the new Arab state in Mesopotamia and strengthened the Arabs in Arabia. When followed such a measure of success against the full array of Allied diplomacy at Lausanne as to justify his claim to another victory, the Mohammedan realized that against the divided Allies he was a power indeed. *He learned that it was easier to threaten a commercial interest than to beat an army.*

Studies Commercial Geography

HE FURTHER learned that a successful demonstration against an important vested interest *rendered unnecessary on his part the facing of any army.* He became, as the Allies will no doubt be made aware ere long, a keen student of commercial geography. He satisfied himself on the point that, if France was worried about her African Empire, and Britain was taking no chances of trouble within her wide Moslem realms, Italy also was looking anxiously across the Mediterranean to her North African possessions the while she was setting affairs in order at home. The Mohammedan of Tripoli in his confidential moments will tell you that *Italy's prompt attack upon Greece in connection with the murder of Italian representatives had a message for people other than the Greeks.* He has accepted it as addressed partly to himself, and he smiles to think that he is strong enough to draw from Italy such an indirect intimation that a swift and heavy hand was at the helm there.

No circumstance attending the Mohammedan revival exceeded in importance this—the setback to White prestige brought about by the war. In those years during which, for purposes of war, the best men of the countries termed Christian were being intensively and scientifically decivilized, the education of the Moslem progressed amazingly. Barriers which he had regarded as impregnable, and almost sacred to the White, were ruthlessly demolished. Many long-cherished distinctions were wiped out. And the end of the war found Christian prestige at a very low ebb in the Moslem lands. In the mission fields Christian effort had suffered great loss. No practical work, however earnest, could make good the devitalizing of the Christian message as it was heard by Mohammedans who had been in the struggle and "had seen what they had seen."

He was quick to note, further—this freshly educated Moslem—that in no lesser measure had Christian influence ebbed among his Negro neighbors and trade friends in those regions to which "heathen" had returned to tell of the things they had seen and done in the white men's war. The spectacle of nations called Christian tearing each other to shreds, and employing himself and the Negro to help them in that process, had indeed an important part in the awaking of the Mohammedan. "These are our rulers!" That phrase was heard often in the days of the war and its desperate exigencies, and it has been a common phrase in Moslem lands ever since.

Unpalatable as is the fact, there can be no denying that the first surge of this Mohammedan revival came upon a wave of contempt for the White and the Christian. These are great days for the Children of the Prophet. They are going forward in good heart, purposeful, laden with counsel, and interested in the new and great game. One may hear all these things on the roads that lead to and from Mecca today, if one is acknowledged as being of the Moslem elect, or if one has the means of listening-in.

Learns Labor Has Value

AND this new and great game? The leadership of the Turk has been hailed with enthusiasm, and it is under his tuition that the Moslem is to wage the silent war. That study of commercial geography has been no mere academic diversion. The appraising eye, which the Mohammedan leaders have turned upon the position of their followers in relation to the resources, products, trade and labor possibilities of the lands in which they are located, is to take further heed of these things. The policy is the development of local and territorial influence, the aim, political power. The Moslem has been instructed in the matter of valuing and selling those things which are his, and may be his, to sell. He has learned that his labor has a value other than that represented in cash or material kind, and there has been shown him *the fact that he may often win much by doing nothing.* And all that he does or refrains from doing is to be in accordance with instructions, for all will be to the glory of Allah and the advancement of the kingdom of the Prophet. Good will or ill will he will sell as advised, in the interest of the True Faith or to the discomfiture of an enemy thereof. There will be much peaceful penetration, and steady and patient lengthening of cords and strengthening of stakes. The intention is that as organization advances there will be no part of the Moslem world too remote or uninterested to respond to the needs and claims of another part. The seed of Mohammedan influence will be sown unceasingly. And the sowing will be done with chief regard to the exercise of political rather than military power. There are commercial fields into which the earnest Moslem workers will put much hard and unceasing work, that in due time there may be such a yield of good crops useful to Islam, or tares heartbreaking to its enemies, as shall satisfy the keen and cold intelligence which now directs Islam. "The congress declared for the full freedom of all Arab countries."

Where His Advantage Lies

ONE may be permitted to suggest that the very extent of that claim raised in important quarters a tolerant smile; and, as a matter of fact, there is more than a suspicion that that is just what it was intended to do, so that the other and very serious side of the work may proceed in peace without too much notice. And it will proceed in peace. There is nothing in this Moslem revival, as at present animated and directed, which need cause alarm for the safety of such peace as the world enjoys just now.

The Moslem missionary-politician of North Africa, East Africa, Arabia, Iraq, Palestine, India, the Straits Settlements, and the islands down to Java, is hurrying off to his duties. In the next few years he may have something important to show for his work. Well he knows that he will not work unobserved. He knows equally well, however, that if he works at peace within the law there is no very effective way of checking him. That is part of the lesson which he has been asked to take to heart. He has one advantage which, under the careful tuition of his mentor, he will use to the utmost. It lies in the fact that his opponents are also opponents of one another. It will be his duty to slip between them wherever possible. Has not the Turk just beaten them in Europe because they were opponents of each other? He was told that at the congress a thousand times. And in the Mohammedan fence as he visualizes it there is no gap between the stakes through which they may squeeze. From the commercial necessities of the world the Moslem has set out to forge the weapons of his new warfare. The time to recognize that an important world-movement has been initiated is now. To view it without alarm, for there is no need for grave alarm at this stage; to calculate its possibilities, assuming its success to any considerable extent; to guard against surprise—that is the duty which has fallen to the representatives of the powers most deeply

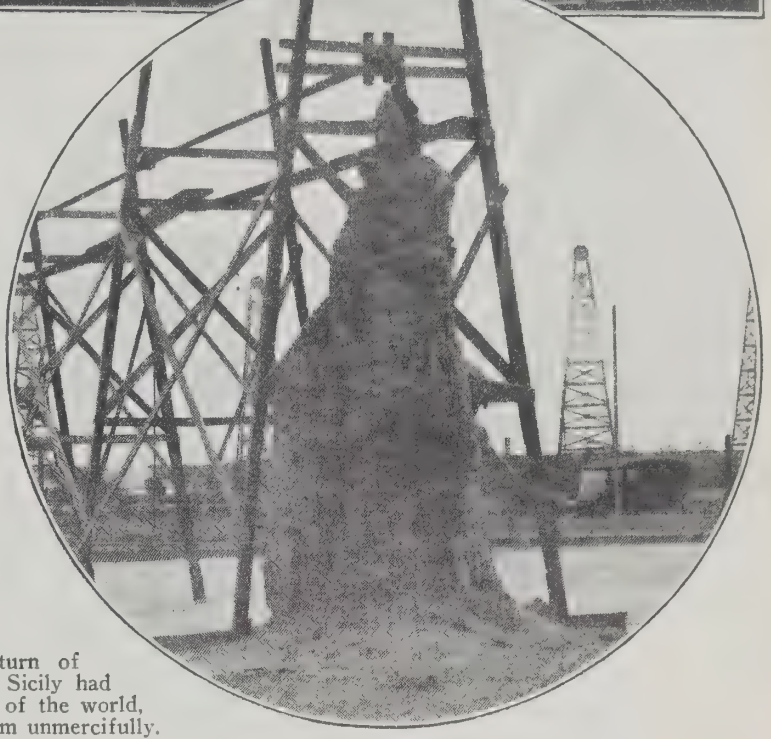
(Concluded on page 13)

Three bins blended into one bin, blazing in the hot afternoon, bright yellow and green under the beating sun. There are one million tons of sulphur here, worth fourteen dollars a ton.

The Story of Sulphur, Essence of Combustion

American Manufacture Freed of Foreign Domination

By MAX BENTLEY



The action of the air on hot liquid sulphur is to cool it and restore it to its original crystal form.

A SHORT time ago a little group of business men in London pulled up their chairs around a table and signed a treaty. Like most of the other Treaties of London, it was concerned with a partitioning, and was the result of war. Since the nations represented by the two groups had been traditional friends, it follows that, some day, a war would ensue. Since the Americans were on one side of the table, it follows that they were the victorious group dictating the treaty's terms. And being, as always, victorious, it follows that they were giving away much and receiving little. It matters but slightly that the partitioning was one of markets rather than spoils and was based on industry rather than ethnology; or that the war leading to it was a war over raw explosives, under the earth, rather than a war with firearms in the hands of the soldiery. The principle is the same.

On one side of the table were the envoys of the three American concerns which now produce eighty-five per cent of the world's yield of crude sulphur; the concerns being the Union Sulphur Company, the Freeport Sulphur Company, and the Texas Gulf Sulphur Company. Facing them were the envoys from Sicily. The agreement signed by the victorious Americans and vanquished Sicilians partitioned the crude sulphur markets of the world. The salient points of the treaty were that Sicily is given the Italian markets while North America is assigned to the Americans, with the remainder of the world proportionately distributed on the basis of geographical position in relation to consuming countries; Sicily to be allowed to sell to any country a fixed maximum of crude sulphur for the manufacture of sulphuric acid, and to export annually a tonnage greatly in excess of Sicilian exports in recent years; disagreements to be submitted to a London board of arbitrators.

Why did the Americans do it? Why such magnanimity, with Sicily at their feet and the world theirs? Let E. P. Swenson, of New York, answer for the victors. Mr. Swenson is president of the Freeport Sulphur Company, also chairman of the board of the National City Bank of New York. I journeyed to Freeport, Texas, to ask him why, and he replied:

"Being unable to compete with the American producers on an unregulated basis, Sicily would have been forced to close her mines, abandon her chief industry, and throw out of employment 30 000 skilled workers. The effect on Sicily and Italy, and indeed on the world, in these unsettled times, might have been far-reaching. The American producers were impelled by the thought of live and let live. The American sulphur producers took advantage of the Webb Act, apportioned the export markets among themselves, and then voluntarily admitted Sicily into the agreement."

Sicily rears itself out of the Mediterranean Sea, off the southern end of the Italian peninsula. Studying its location—just beyond the toe of the boot—gives an impression that poor Sicily is the unloved child bodily kicked out of the family. As a matter of fact, Sicily to Italy is what the Ruhr is to Germany. Since 1748, when the general partitioning of Italy gave the island to Charles III of Spain, the motherland has been willing to fight for its redemption, as, successfully in 1860, when Garibaldi and his Legion of the Thousand overthrew the Bourbons and reunited Sicily with Greater Italy.

The importance to Italy of the Sicilian sulphur industry becomes apparent in light of the Italian birthrate, highest in Europe, a two-fifths increase of the population in fifty years, and Italy's ambition to become an industrial nation as a means of checking emigration. With ten per cent of the total population already engaged in industry, Italy would find it a difficult task, and one fraught with grave danger to herself, to absorb 30,000 workers skilled only in one line suddenly thrown upon her by the closing of the sulphur mines.

The London agreement was a return of good for evil. Prior to this century Sicily had always controlled the sulphur markets of the world, and, controlling them, had squeezed them unmercifully. The substitution of iron pyrites in the manufacture of sulphuric acid sprang from Sicily's hoggishness. It sprang from a reckless price increase in 1839 on raw sulphur from twenty-five dollars to seventy dollars a ton. Although shaken, Sicily's control was not broken, and as late as 1895 Sicilian sulphur was being unloaded from the ships at Galveston. It developed that this was carrying coals to Newcastle, for about that time along came an American who showed the way to utilize the vast sulphur beds underneath the Louisiana and Texas Gulf coast, and thus cut us free. This was Herman Frasch, an engineer. His achievement consisted in evolving a superheated water process for mining sulphur, by the use of which the three American concerns can now produce—if pushed—five million tons annually. Since sulphur makes up more than one-tenth of one per cent of the first ten miles of the earth's crust, corresponding to about 2,000,000 cubic miles, and since, as noted by an authority, "in addition to its utilization in practically every form of industry it enters into the make-up of both vegetable and animal tissue and is consequently essential to life itself," the magnitude of Frasch's discovery will be appreciated. It reduced American consumption of Sicilian sulphur from 165,000 tons in 1895 to nothing at all in 1922. It increased Canada's importation of American sulphur from 1,000 tons in 1895 to 150,000 tons in 1922. It knocked the Sicilian producers off the map and transferred world control to our shores.

When the history of industry is finally written, it will be recorded how American ingenuity and initiative emancipated American manufacture in the direction of sulphur supply; how the depths of the earth were being plumbed by the prospector for oil, whose drill bit, instead of plunging through the shifting oil sands underlying the Gulf coastal plain, came to rest in a limestone understructure perforated with veins and pockets containing a bright yellow substance in crystal form. This was sulphur. An American oil prospector found it, while the War Between the States was raging. Another American with initiative hit on a way to extract it in its native state and at small cost—and American dominance was achieved.

What *is* sulphur?

As an identified substance, it goes back to remote times. As early as the fourteenth century it was used as a basic ingredient in gunpowder. The frequent allusions to brimstone found in early literature indicate that the Medievals had a clear knowledge of its combustive qualities, reaching their conclusion, no doubt, from a study of volcanoes. It is, in truth, the essence of combustion; a strange enough fact in view of its non-combustibility in the raw state. Melted by water heated to a temperature of 325 degrees Fahrenheit, it ascends a pipe and, boiling and bubbling, runs out on the ground only to return to its crystal state. A sulphur bin or vat is dislodged by a dynamite charge with little danger. A sulphur fire is smothered with more sulphur, heaped upon it with a shovel. Lightning has no effect on it. It is loaded into freight cars and the doors closed. One stage of the refining process consists in spraying it into a nearly air-tight chamber. Yet it contains a spark that can set the world on fire. Alchemists of old found that spark, centuries ago, and down through the ages it has come, blessing and burning, according to the need of the hour.

Native, it is mankind's beneficent friend. Refined, it becomes at once his friend and foe. As an ingredient in pharmaceutics, the druggist finds it invaluable; it purifies the blood and tones up the constitution generally. The farmer must have it to revitalize his worn-out soil. The paper manufacturer could not be without it. The tire manufacturer vulcanizes his raw rubber with it. As a bleaching substance it has no rival. As the authority quoted has said, its utilization is into practically every form of industry, making it essential to life itself.

On the darker side of the picture, as a basic compound of gunpowder, guncotton, nitric acid and picric acid, it is essential to the conduct of war. The British admitted a tragic need of it in those trying days of 1914 when the "little army of contemptibles," short of ammunition, was reeling under the German's sledgehammer blows as he hacked his way toward the channel ports. The importance ascribed to it by the Germans themselves in a later stage of the conflict is illustrated by the order that went out from Wilhelmshaven to the submarine captains to "give preference" to the sulphur-bearing ships plying between Sweden and Norway and England.

If the signatories to the Treaty of London approached their task earnestly and with due solemnity, it must have been that they realized they were playing with fire.

Trailing Mr. Swenson, I spent a week at the sulphur mines of the Freeport and Texas Gulf companies. The Union Sulphur Company, the oldest member of the triumvirate, operates in Calcasieu Parish, Louisiana. The "dome" formations with which the sulphur deposits are geologically associated are common enough on the Gulf coastal plain, yet the farthest eastern exploration, at Belle Isle, Louisiana, is only 225 miles from the farthest western, at Big Hill, Texas. Between those points, a half-day's ride by train, enough sulphur has been found to supply the world; and the amount as yet unfound is incalculable. Not only sulphur: it has been demonstrated that these crustal warpings cover immense future supplies of oil and rock salt. The domes vary in size, ranging in diameter from a few yards to one and one-half miles and extending in depth as great as several thousand feet. They are rounded uprisings on the prairie, sometimes only geologically identified, sometimes visible to the eye.

The affinity of oil and sulphur on the coastal plain has been a fortunate thing for industry. It was the oil prospector, drilling in the regular way and taking his core at successive depths as a matter of routine, who found the sulphur beds at approximately 1,000 feet. It was the gushing in of the great Spindletop oil field near Beaumont, Texas (a dome field itself), that made profitable the Frasch discovery by supplying cheap oil for fuel. The domes on the Freeport Sulphur Company's properties were extensively developed for oil before the sulphur deposit was tapped. It seems reasonably safe to predict that the low-lying plain with its covering of tough salt grass will have yielded to man's quest, in time, enough wealth to equal the national debt. Nature has imposed plenty of obstacles—perhaps to make the game worth the candle—arranging them seasonally, such as frequent rains in spring, mosquitoes in summer, tropical hurricanes in autumn, and sudden and searching northers in winter. Yet it is a region pleasant enough, and much of the heroic history of Texas and Louisiana has been enacted upon it. Great rivers traverse it on their way to the Gulf. The summer heat is tempered at night by a cool, fresh breeze which blows the mosquitoes far inland. Barely above the top of the salt grass the snipe skims and darts on his erratic course, and by winter it is the feeding ground of millions of ducks and geese. What Nature has denied in the way of shaded meadows and green hills that satisfy the eye,

In the Prehistoric Caves of Southern France

Artists of Early Days Tell Their Stories in Imperishable Rock Tracings

By ANDREE PRATOUCY

AS ONE walks along the road to Les Eyzies-de-Tayac in Périgord, one comes upon a part of France that is rich in prehistoric wealth. The giant rocks on the left, the surrounding landscape of odd mountains drilled with foxes' dens, all of them I know well. That was the "country" of my childhood when as an awe-stricken, puny girl I could not resist following through the thick night of the grottos an ardent student of the Prehistoric—my grandfather. I knew that anfractuosities and caverns had not always sheltered rooks and owls. Some thousands of years ago, upright, walking creatures used to dwell there, for there was no better dwelling to be found. They lived up in the rock and down in the ground, in the cold, in the night. That their mates might be content or their primitive minds brighter they painted on the rocks or carved in reindeer horn, mammoths, bison, wild horses—the only living models that used to call on them.

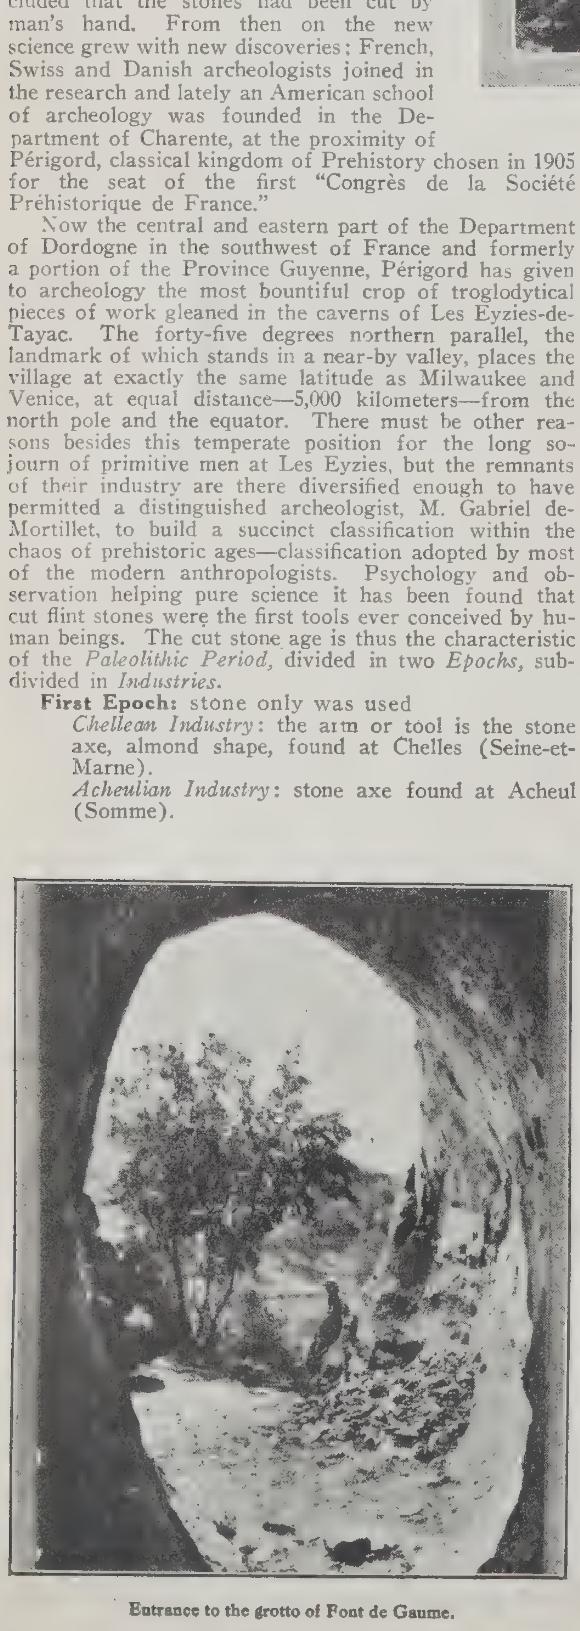
If we leave scholars and philosophers, materialists and evolutionists to argue in the fog about the origin of the human world, we may follow the archeologists who stake out the newly opened highway of Prehistory. A French savant, M. Boucher de Perthes, was the first to break the ground when in 1841 he found in the Somme valley some sharp stones which he thought had been flint tools. Those quaint instruments were buried under six meters of gravel and three layers of clay, grit and marl, among broken bits of deer and elephant bones. But for some time incredulous people ridiculed the discovery and it is only in 1860 that several scholars gathered in the Somme valley to study the discredited find, and unanimously concluded that the stones had been cut by man's hand. From then on the new science grew with new discoveries; French, Swiss and Danish archeologists joined in the research and lately an American school of archeology was founded in the Department of Charente, at the proximity of Périgord, classical kingdom of Prehistory chosen in 1905 for the seat of the first "Congrès de la Société Préhistorique de France."

Now the central and eastern part of the Department of Dordogne in the southwest of France and formerly a portion of the Province Guyenne, Périgord has given to archeology the most bountiful crop of troglodytical pieces of work gleaned in the caverns of Les Eyzies-de-Tayac. The forty-five degrees northern parallel, the landmark of which stands in a near-by valley, places the village at exactly the same latitude as Milwaukee and Venice, at equal distance—5,000 kilometers—from the north pole and the equator. There must be other reasons besides this temperate position for the long sojourn of primitive men at Les Eyzies, but the remnants of their industry are there diversified enough to have permitted a distinguished archeologist, M. Gabriel de-Mortillet, to build a succinct classification within the chaos of prehistoric ages—classification adopted by most of the modern anthropologists. Psychology and observation helping pure science it has been found that cut flint stones were the first tools ever conceived by human beings. The cut stone age is thus the characteristic of the *Paleolithic Period,* divided in two *Epochs,* subdivided in *Industries.*

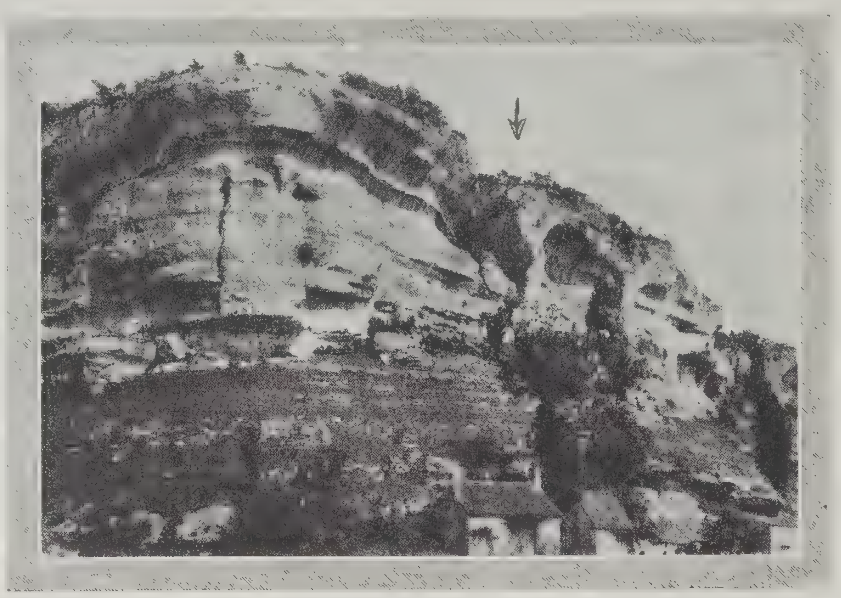
First Epoch: stone only was used

Chellean Industry: the arm or tool is the stone axe, almond shape, found at Chelles (Seine-et-Marne).

Acheulian Industry: stone axe found at Acheul (Somme).



Entrance to the grotto of Font de Gaume.



View of the rocks of Font de Gaume, and entrance to the grotto.

Mousterian Industry: the stone has a better shape and besides it the flint point and sharp-edge scraper are found in the grotto of Le Moustier, near Les Eyzies.

Second Epoch: stone, bone and reindeer antlers are used.

Aurignacian Industry: characterized by the splitted bone point.

Solutrian Industry: very important for the variety of arms and tools cut in laurel-leaf shape, made with reindeer horn and carved with figures representing animals.

Magdalenian Industry: bone knives, barbed harpoons found in the shelter under rock of La-Madeleine, near Les Eyzies.

But as the climate became warmer, reindeers emigrated and Man who needed their flesh for food and their bones for weapons had to follow their tracks up North, leaving at Les Eyzies the puzzle of his race and life for the generations to come.

The tiny village does not seem to feel the burden sealed up by past centuries in the overhanging rocks. It witnessed so many happenings that its long row of stone houses, its green leafy foreground belted in by the gay river remain unmoved by the annual flow of cumbersome tourists. Yes, the rocks sheltered troglodytes, but they also sheltered English corsairs during the One Hundred Years War; Gallic Druids led processions to the holy mistletoe of Laugerie's oaks; Romans had built a marble temple where the tenth century saw the founding of the actual church of Tayac; Merovingians leaned their "villas" against the natural cliff walls still all scarred with beam holes, and Medieval lords pitched a crown of feudal dungeons—chateaux of Mayac, Reignac, La Roque St. Christophe—over the mountain tops.

Thus this little corner of earth, still a delight for hunters and anglers, painters and mere tourists, has been inhabited—almost without interruption—since the Paleolithic Period, each civilization leaving behind some token of their short passage.

Yes, to the amazement of our up-to-date generation it must be admitted that the troglodyte artist could still be our teacher on many points. The patent proofs of this, chiseled with rock on rock, is still challenging Time's gnawing efforts. As I dimly remembered the vague figures which I had seen on many walls in Les Eyzies grottos while assisting my grandfather with a flickering candle, I went on to visit once more the "Grotte du Fond de Gaume," one of the many prehistoric marvel galleries dug deep in the mountainous banks of the Vézère River.

Passing the "rocher de Cro-Magnon" standing steadily as some gigantic sentinel watching from over the riverside the rocky citadels of Les Gorges d'Enfer and Laugerie I followed the village street so charmingly country-like with its oddly named inns, its tiny shops naïvely advertising "Vente de silex tailles prehistoriques"—prehistoric cut flint stones for sale (when plowed by a keen observer each field, meadow, garden, around there gives a harvest of prehistoric "silex," the duplicates or common surplus of which get into the building of houses, or is intrusted to the grocer for sale).

Close by on the right, over the river bed on the left and encircling the clear horizon in front, the half-naked rocks seem to survey the country from the large openings squarely cut in their steep flanks. At about halfway to their summits they all curved in as if having been slowly eaten by some disease. The parallel white stripes which scar them seem to indicate that glaciers of remote periods and the streaming water of geological ages submerged the valley up to that point.

A white, well-kept road took me to a blue poster which announced that I was to find the keeper of the Font de Gaume grotto at the opposite farm. But no one answered my knock there save a loud voice which shouted in patois dialect from a near-by workshop "Ei dejou lou noujiers"—that is to say that I would have to fetch "her" or "him" (the patois is genderless) "under the walnut trees." I did find her, a tanned little peasant woman with the local checked headkerchief curled about her hair, picking up walnuts which had fallen down in their fat green robes. Since besides being keeper she was also the guide to the grotto, she hesitated a while between her actual work and her official duty, then decided she must wash her hands, take off her wooden shoes. I saw her again on the road, busy with four glittering knitting needles; and all the way up to the entrance of the cavern, in spite of the very steep path and sometimes dangerous curves, she kept on knitting a brown woolen stocking.

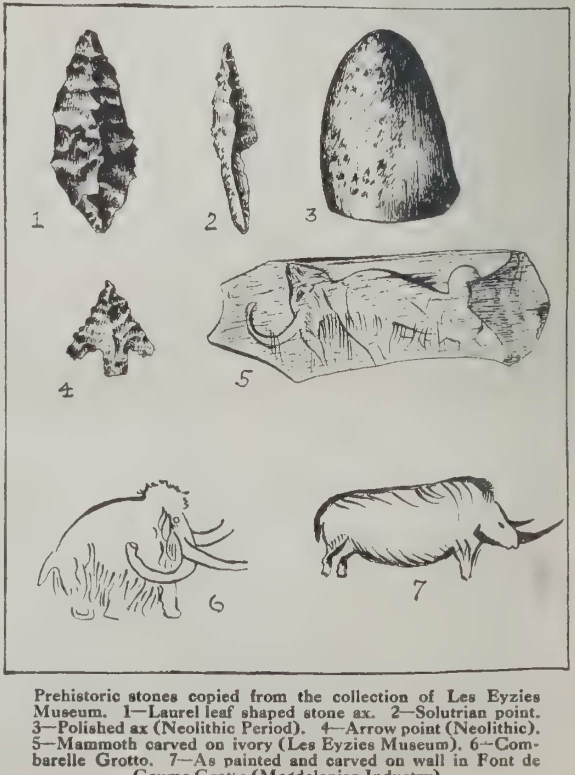
The huge gap which led way to the grotto was decorated with blue, white and red garlands of paper ribbon. Which troglodyte saint's birthday was it? No, that debauch of colors was simply in honor of the Paris Beaux Arts School Director who had come there the day before.

My knitting conductor unlocked the door—handed me an entrance ticket. Then, as I was waiting for the flickering candle to light, the grotto became suddenly aflame with the glow of electric bulbs. I gasped in surprise—maybe in horror. Electricity in the cave-men home! Was this intrusion to be deplored? No, for the light revealed what I previously could not have guessed, a beauty of stalactites hanging from up above the vault like graceful marble needles.

Behind my guide I walked along the narrow corridor, now two to five meters high, now so low that we had to creep on the ground to get into a wider part. Then we ascended the so-called "Rubicon," an iron ladder climbing over a stalagmite wall, descending into a wide room about sixty meters long and ten meters high. What picture gallery can be more original than this one, concealed in the depth of a mighty rock, with all masterpieces painted and carved on the rock itself? It was like the nave of some Gothic cathedral, with pillars of stalactites, and pagan frescoes. The two walls are literally covered with mammoth and reindeer heads, odd bison, fighting red bulls, galloping horses. Strange, unknown humpbacked animals spring forth from under a crystallized calcareous veil. In that room and in the next one—consecrated to bison only—there are no less than twenty-five ornamentations colored with red ocher and manganese black paints, some very distinct and neat, the others half-rubbed out by some powerful destroyer. But all of them show a remarkable talent for observation, a strong, artistic appreciation of the grace of line and attitude. The cave man insight snapped the animals as they were living some vivid scenes in the near-by thickness or in the open valley. Perhaps he would fight them out of his dens, perhaps he would struggle with them for his life.

It may be so, but it may also be that, when Thunderbolt had lighted the moss of his stone lamp, Man saw in its plain crudeness the depth of his own bereavement. To repair cruelty of Fate, to forget his poverty, to chase out the strain of fight and the taste of blood, he started on the two trails along which Humanity is still searching consolation: Art and Work.

Still rattling her knitting needles, my guide bade me goodby. And the same setting sun, which pushed mammoths and bison back into their repairs some hundred thousand years ago, fell once more behind the circus of rocks while night wrapped in the darkness of the grottos the secret of the troglodytes.



Prehistoric stones copied from the collection of Les Eyzies Museum. 1—Laurel leaf shaped stone ax. 2—Solutrian point. 3—Polished ax (Neolithic Period). 4—Arrow point (Neolithic). 5—Mammoth carved on ivory (Les Eyzies Museum). 6—Combarelle Grotto. 7—As painted and carved on wall in Font de Gaume Grotto (Magdalenian Industry).

Mr. Ford's Page

BUSINESS and Government both being necessary to the public welfare, why do evil results occur when they come together? An uneasy feeling oppresses the people when they see the two in agreement; they suspect that private interest in commerce is linked with the servants of private interest in politics. It is only plain truth to say that this feeling is abundantly justified by past occurrences. But is this evil result unavoidable? Does it inhere in the nature of business or government? No. Private interest is fatal to any public service, and business is public service as much as government is. The spirit of service in business linked with the spirit of service in government, and surmounting both the spirit of Good Will to the Nation, is the only preventive, the only cure; and, if adopted, will become the sorest punishment of wrong.

WHEN politics and business have relations, the result seems always to be unfavorable to the public interest. Why this should be so, presents a problem which few seem to have considered. Yet that it is widely believed to be so, the entire emphasis of politics for the past fifty years abundantly testifies. Indeed, since Revolutionary days the country has never been free of the suspicion that financial and commercial interests have been seeking to "use" the government for their private advantage.

The extent to which this is true is found to be rather amazing once the attention is fixed on it, and indicates that it comprises an important element of the total problem with which American life has to deal. In the making of the Constitution there arose questions about property and the rights of property to special influence in Government, a right which was not specifically written down but which has been more or less assumed ever since. As early as Jackson's time there was the great contest between the money power and the government elected by the public—a contest concerning which it would be well for modern Americans to inform themselves. Lincoln was firmly convinced that the issue of slavery was not so much sectional as financial, and that the financial interest which favored it was not so much in the South as in the North—in New York, to be plain. In the South the slave had become established as part of that section's real and usable wealth; in the North, slavery was desired as part of an immense system of exploitation. For this reason New York once talked of cutting herself off from the Union and becoming a "free city," like Hamburg, which drew from Lincoln the comment which is applicable also today:

"Well, I reckon it will be some time before the front door sets up bookkeeping on its own account."

The advantage taken of the government in the stress of civil war is not a very good page in the story of American business. The whole tale of the tariffs, up and down, is the scrimmage for special government permission to hold up the American people and deprive them of the wholesome advantages of competition, both in manufacturing and purchase.

Further, one has only to consider the relation of various special lines of business with the Government: public land scandals; sugar scandals; shipping scandals: "embalmed beef" scandals; railway scandals; liquor scandals; oil scandals—indeed, at almost every point where "big business" has touched government, an uneasy feeling has arisen that all was not for the people's best interests. We owe that term "big business" to this very feeling.

At the present time there has been difficulty in selecting men to examine certain transactions to ascertain whether the government's interests have been properly protected in them, the difficulty arising out of the fact that most of the men competent to make such examination have been at one time or another in the employ of "big business." We have come to a condition where even an employment by "big business" results in suspicion of a man's integrity in performing duties for the Government.

That this feeling is not unfounded is shown by the dead set which "big business" has made to get into its employ men who have served the government in exalted position. Why? Not that these men are exceptionally able—the more able men, it seems, do not occupy themselves with political offices—but because they have "influence," and their employment by units of what is called "big business" indicates that their duties consist in using their "influence" in their private employers' behalf. Sometimes these men are lifted bodily out of the President's Cabinet by the force of dazzling salaries, sometimes they are taken from the departments. At any rate, there is an uneasy sense that to pass from public employment to private, is somehow to go over to the enemy. Wrong or not, it is the feeling that prevails.

Why should it be so? There is no necessary antagonism between business and government from the point of view of the people's necessary interests—the people need both. Government would be superfluous without business, and business would be impossible without government. Both exist because they are somehow related to the public welfare.

It is interesting to sketch the three broad phases of the dependence of business on government as these phases are observable in the story of our own nation. The first planting of the nation came in the shape of trade licenses from the mother government. Business was given certain privileges in consideration of the risks entailed in opening up a new country. Most of the early settlements came as "companies," in the commercial sense of the term. From this beginning, certain lines of business attained independence of privilege and established themselves firmly by reason of the service they rendered. Others continued to lean upon government: they preferred political pap to independence by service: this was the second stage. And then swiftly came the third stage where business that had not established itself by service sought to be bought up by the government, to save it from ruin. It is surprising how favorable to public ownership public service corporations have become! Many a city is buying junk in the form of public service corporations which have failed because they have tried to live on privilege and not on service. The government itself is offered the whole railway system as a way of escape for the owners of a broken-down policy. The point is, independent as well as dependent business is as necessary as government for the welfare of the people; parliaments are worth nothing without farms and manufactories.

Why then the fear of the people when the two, business and government, seem to come together in agreement or action? The fear arises from experience that it is not the public service in government and the public service in business coming together for a greater public service to the nation, but a private service in business, having captured the powers of government, using them for private advantage only. It is astonishing to note how Government remains exclusively in the hand of a certain group, whatever may be the party name of the administration in power. The same names appear on the subscription lists of both parties that appear in the scandals. A new government does not mean a fresh new selection from the body of the people, but a selection by and from a very close political corporation already existing, and this continuous political personnel linked with a continuous commercial corporation personnel makes all the trouble.

We have made no progress whatever in preventing the bad results that follow. No new features appear in the exposures that are made. The tricks are all old. Neither is there any new discovery of a method for divorcing business and government, or of divorcing either from the people's life. Both are necessary and their union would be entirely beneficial if Public Service were the rule of each. That government survives which serves the people. That business survives which serves the people. Service makes each independent of the other, yet renders evil results impossible if both should come together.

There is nothing good in government or business but good will, and good will in these departments of life means a will to serve the people well. It is an old phrase, but it persists because it is true, and it will be endlessly repeated until responsible men admit not only its truth as an ideal, but its practical necessity as an everyday policy.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

2. Give both old and new address.
3. Write clearly.

Score One for the Banks

IN CONFIDENTIAL notices to western banks, secretaries of Bankers' Associations have given information as follows:

"You are advised that Treasury Savings Certificates have been withdrawn from sale.

"Orders to this effect have been issued to all Postmasters.

"It is the wish of the departments at Washington that the matter be not discussed in newspapers, and you are therefore requested to refrain from giving it publicity.

"We can all see why it is much better simply to say nothing further about it."

Inquiry for the reason of the withdrawal of Treasury Savings Certificates elicited the information that the public's patronage of the Certificates was thought to be drawing money out of sections where money was badly needed, and that the banks of those sections had protested. It was further said that the situation was not so drastic as the above quoted Bankers' Association letter would indicate, inasmuch as it was only the advertising campaign that had been stopped, and not the sale of Certificates.

But, score one for the banks! It is a satisfaction to learn that they have at last come to their senses regarding the serious matter of money drainage. And it is to be hoped that they will go further and consider how far they themselves, in the past, have been the drains through which money has been taken out of the community and sent to the great speculative centers of the East. It is scarcely possible that any amount of patronage of Treasury Savings Certificates could equal even a small percentage of bank deposits, or that the effect on the money stocks of the community through purchase of Certificates could be comparable to the effect of passing deposits on to New York banks.

The great difficulty in many communities of the West is that the money which should have stayed at home to finance the farmers, was sent to New York to finance the motion picture speculators.

If bankers who are represented in the associations which protested against the sales of Treasury Savings Certificates will exercise the same vigilance on all other sources of money drainage, we may look for more self-sustenance in many of our straitened states.

The Hazards of Rum-running

IF IT be true that every evil carries within it the seeds of its own dissolution, then bootlegging may be expected to disappear. The philosophy has been proved in the history of the saloon, for it is now admitted that the biggest factor in the abolition of the saloon was not the temperance or prohibition campaign, but the saloon itself. There were not enough teetotal abstainers in the United States to vote the country dry, but there were enough victims of a swiftly degenerating saloon which had become the tool of brewers and politicians and the outlet of Jew-vitiated liquor.

Bootlegging, except in the lower strata, has already suffered extremely as the purveyor of poison. The public is alarmed. Sales now depend on reasonable and believable assurances of the genuine character of the brands offered for sale. It is not too much to say that the illicit traffic has been compelled to deal more and more in wet goods made in this country before prohibition went into effect, or imported from foreign countries.

But even this illegitimate trade in legitimate goods is now threatened with curtailment. It is complained on the other side of the sea that rum-runners are forming the habit of not paying for their cargoes after selling them. One Scotch company has retired from the business after losing $1,500,000 in trusting rum-runners with goods. Very rich shiploads were duly sold in America, but thereupon the rum-runners pocketed the proceeds and retired. The proverbial honor among thieves was missing.

Bit by bit the business will find its own level, and that level will probably be one which could wisely have been established by law had not the stupidity of the liquor barons forced prohibition on the country.

Why Policemen Go Wrong!

WILLIAM A. COLEMAN is a police inspector in New York City.

He is on trial charged with laxity in enforcing the Volstead Act. Inspector Coleman, on the witness stand, testified as to his efforts to suppress illegal resorts in his district, which consists of Chinatown, Little Italy and the Ghetto. The New York *Times* devoted nearly two columns to the detailed testimony which made up Inspector Coleman's appearance. The inspector's testimony was the thoroughgoing story of an officer's sincere efforts to bring law and order into the lawless East Side of New York. But let the New York *Times* tell it:

> "I have Chinatown and the Italian section in my district," said Inspector Coleman; "also the largest Jewish center in the world. There are about 450,000 people in that Ghetto alone."
>
> He told at some length of the sacramental wine which is issued by rabbis on the lower East Side. "All rabbis have permits and there is no check on the amount they issue to members of their congregations," he said. Much of it goes to other sources than that intended by law, he intimated.
>
> Turning to the enforcement of prohibition, the inspector said:
>
> "Last year 40,000 arrests were made in my district, of which 1,677 were for violations of the liquor laws. With only twenty plainclothes men I made one-fourth of these arrests."

This is commended to the notice of the Kehillah and it may even elicit a "Blast from the Shofar" but it is a safe bet that the only way in which Jewish influence will make itself felt is either in the dismissal of Inspector Coleman or his transfer to a district not looked upon with favor by inspectors of the New York Police Department.

Usury Is Never Patriotic

IN A recent issue of *Barron's Weekly* occurred the following statement:

> "One of the significant features of the stock market recently has been the buying of high-grade railroad stocks and such industrials as United States Steel for London account."

This migration of capital is attributed to the victory of Labor in the recent British election, on the assumption that capital will no longer support English industry.

The assumption is far-fetched, but that fact does not diminish the existence of a false theory which gives to capital an unmerited importance. The theory is false because it fails to distinguish between an industrial worker and an industrial parasite. To say Capital supports Industry is to say effect comes before cause.

If the item is correct, it only illustrates by one more event that Capital owns no country, and usury knows no patriotism.

The implication that England suffers and this country profits by this migration of so-called capital, is another mistake. Railroads and industrials are not affected in operation or productivity by ownership changes in their stocks or bonds. Purchases of this kind are made because they promise large returns for idle money, and these high returns are a tax upon business. American investment is and always has been more attractive than investment in British securities, and so long as that condition obtains, whether Labor or Capital control abroad, the current of speculative investment must cross the Atlantic hitherward.

Instead of that current of money being the loss of Great Britain and the gain of the United States which these wiseacres think, there is a constant flow of dividends across the Atlantic, supplying the trade channels of Britain with a greater volume of currency, and from outside, than her own low interest rates would yield. This increased return is paid by American industry, without having received one jot or tittle of benefit.

Investors Need Be Careful

ARE INVESTORS in foreign bonds aware that the international banking houses which negotiate for them assume none of the risk involved? Twenty-five millions of the recent Austrian loan allotted this country were quickly absorbed, while the firms floating it merely pocketed their ten per cent commission on the face of the loan. But, asks the investor, are they not guaranteed? Not by the bankers. Each of the nations participating in the net results of the loan is a partial endorser, but as a banker once asked, who will guarantee such a guarantor? France, herself without credit, has underwritten nearly one-fourth of the Austrian loan.

The same international group of financiers is offering a forty million issue of Argentine bonds, and is negotiating for the agency of a two hundred and fifty million "offering" by Japan.

The bait held out to the investor is a ten per cent discount and a high rate of interest—up to this time seven per cent. That is, for a ninety-cent dollar the borrower promises to pay one hundred cents, and an additional seven cents in interest annually. If the debt is paid it is a big return, but as ten cents of each dollar is taken on the spot by the negotiators of the loan, it is only seventy-three cents which the borrowing nation receives. The whole proposition is as immoral as speculation in debased foreign money, the par payment of which is gambled on. Do you know who will pay the difference? Not the financiers, but the people who will toilfully produce in actual wealth the difference in exchanges, as well as the difference between what is received from international loans and what must be paid for them.

Should Be More to Follow

THOSE who have served the Government for a long time are saying that the resignations of Denby and Daugherty are not sufficient to "cleanse" the Cabinet and leave the President free of embarrassment. They are the least offensive of those who should resign. Denby is nationally recognized as honest; Daugherty, whatever his faults, gains in dignity when the character of his more persistent enemies is considered. One or two other men in the Cabinet are capable of doing more damage in one day than these two could do in four years, not *a la Fall* but as bad influences. Yet they flit back and forth today with something distastefully reminiscent of a holier-than-thou attitude, and actually appear as the friends and advisors of Denby and Daugherty. With very few exceptions, President Coolidge would do well to consider getting rid of his hang-over Cabinet and give quiet notice now that March 4, 1925, begins a new deal.

Certain persons who are inoculated with the philosophy of subversion are asking (with a view to having others say what they themselves dare not) if the present uncovering of malfeasance in high office means that the government is tottering. Let them place an impious hand on the government and see! Fall is not the government. McAdoo is not the government. No official or ex-official is the government. It is only at such times as these that we see how clearly the People of the United States are the real government. True, the people are not the politicians; true, the people are sometimes not even the Administration; but these are temporary things: the people, however, *are the government*, and there will be an American Government as long as there is an American People, which is indicated as a very long time indeed. It is rather premature to hint at the dissolution of the United States according to the Bolshevik plan. Although the Bolshevists use official corruption as one of their methods in breaking down government; although a dishonest official is a traitor to the American idea of government and more dangerous than a hundred Bolshevist agitators; nevertheless, the people are not corrupt, and they are the government.

Few more vivid illustrations of the truth of the saying, "Ye know not what a day may bring forth or what a night may put to an end," have occurred than that which in a few hours wrecked candidacies and political partisan props and proposed new problems unheard of before. And the end is not yet. All sorts of disagreeable possibilities lurk in the further conduct of the case. It may be the first stitch which will unravel the whole fabric of wrong ideas in politics and wrong policies in business.

Romeo and Juliet Would Elope Today—Jane Cowl

Not Likely, However, to Encounter Difficulties Met in Shakespeare

By JAMES MARTIN MILLER

JANE COWL

JANE COWL and her company of 28 persons recently completed a three months' tour, presenting "Romeo and Juliet." Miss Cowl played in the principal cities from coast to coast. At every stand she packed houses. The responses the people everywhere gave Miss Cowl emphatically refuted the claim that the desires of all the people, at least, have been hopelessly lowered to the level of jazzdom.

In domestic life Miss Cowl is Mrs. Adolph Klauber. Her husband is her general manager. She is thirty-nine but would pass for ten years younger on the stage or off it. The writer visited with her in Detroit and more recently in Washington. In the nation's capital she played both "Romeo and Juliet" and "Pelléas and Mélisande," her performances being witnessed by the most distinguished men and women of this country, as well as many men of high rank stationed in Washington as diplomatic representatives.

Equal if not superior to her surprising performance of Juliet is Miss Cowl's Mélisande in Maeterlinck's masterpiece. That is the verdict of the critics and the breathless silence, during the action, followed by tumultuous applause at the close of each act, seemed to indicate that public approval is unanimous as well. For sheer beauty it would be difficult to imagine anything more impressive. And the sense of great artistry revealed by Jane Cowl in Juliet is deepened by her latest performance. Hers has been a career of hard work and fine idealism. The future would seem to hold promise of even greater achievements, for it has been a steady growth undisturbed by the temperamental eccentricity and growing egotism which so often checks the development of lesser artists. Those who know her best describe Jane Cowl as an extraordinarily fine woman as well as a great actress. And the fine sensibility of the woman is wafted across the footlights when she plays.

Her Mélisande is on a par with—if it does not outrank—her Juliet. Since Jane Cowl's presentation of the Shakespearean rôle is hailed as the greatest of this generation, it may well be imagined what Mélisande is like. Throughout it all Maeterlinck has carefully refrained from placing accent upon the human side of character, throwing the stress rather upon the spirituality of each person moving in the play; or, shall we say, the soul?

Her New York Success

JANE COWL had definitely decided to produce "Romeo and Juliet" three years before she finally screwed her courage to the point of appearing in the rôle. She acted the part for the first time at the Saxon Auditorium, Toledo, December 29, 1922. Her first appearance in the rôle in New York occurred at Henry Miller's theater, January 24, 1923. The Lenten period which usually has a depressing effect on theater attendances followed shortly after, but Miss Cowl continued in the rôle for six months, playing to audiences that tested the capacity of the theater at every performance. And the run was only discontinued because of hot weather and the necessity for the actress to have a brief vacation prior to a transcontinental tour in "Romeo and Juliet." In the earlier periods of the theater, actresses seldom appeared in so heavy a rôle as Juliet more than two or three times a week and their labors were lightened by the presentation of other performances of lighter rôles. But the conditions of the modern theater made it imperative for Miss Cowl to act Juliet eight and sometimes nine times a week. At the final performance of the original New York run, a laurel wreath was presented to Jane Cowl by the players of New York as a token of affection and a tribute to her services for dramatic art.

Miss Cowl's childhood was lived in Brooklyn, New York, where she attended the public schools and was subsequently entered as a student at Erasmus Hall. The urge of the theater was so great in her that she did not finish the course at Erasmus but left the school to accept a position as an "extra" girl in David Belasco's company at the Republic Theater, New York. She had one line to speak, and at the first rehearsal David Belasco called out from his seat in an orchestra stall:

"Jane Cowl, you can't be heard in the first row! If you can't do better than that we will have to take the part away from you."

Miss Cowl tried again and her director was evidently pleased, for he added three or four lines for her to speak, subsequently placing her in the company of David Warfield in "The Grand Army Man" where she played the part of a woman of fifty, although in her teens. About this time Jane Cowl, sensing the advantages of a broad education, began to attend lectures at Columbia University. But while at the university she continued her stage work.

Leading Woman for Belasco

AS FANNY PERRY in Belasco's production of "Is Matrimony a Failure?" she made her first appearance as a leading woman in New York, subsequently going on tour with that play. The following summer, to broaden her experience, she accepted an engagement as leading woman with a stock company at the Hudson Theater, Union Hill, New Jersey, where she played leading rôles in such plays as "Merely Mary Ann," "Madame X," Kathie in "Old Heidelberg," and so on. She was then engaged to play the leading feminine part of Catherine Darwin in Charles Klein's play, "The Gamblers." Up to this time, although recognized as of extraordinary beauty and some talent, her qualifications as an actress of a higher order had not yet been determined. But her playing of the rôle of Catherine Darwin served to establish her as an emotional actress of the first rank.

Her sensational success as Mary Turner in "Within the Law" in which she acted for two years raised her to the position of a star. She next appeared in "Common Clay."

In collaboration with Jane Murfin she wrote "Lilac Time" and as Jeannine, the heroine in this romance of the World War, she won renewed favor. The play was produced before the United States had declared war but when this country joined with the Allies, "Lilac Time" was credited with having a stimulating effect on the recruiting. Miss Cowl was also co-author of "Daybreak" and "Information Please," in the latter of which she played. She then acted in "The Crowded Hour" which was followed by one of her greatest successes, "Smilin' Through."

Her production of Romeo and Juliet was made under adverse circumstances. But Jane Cowl's Juliet was acclaimed as that of no other actress since the incomparable Adelaide Neilson. She played Juliet 161 consecutive performances in New York, the longest recorded run of a single Shakespearean production in the history of the theater anywhere.

"I saw only one Juliet and that many years ago," said Miss Cowl. "The character always obsessed me. So I wanted to keep my mind clear and not allow my thought to be befogged by seeing others play it. The constant thought of Juliet through the years has made her seem a composite part of me in my own imagination.

"Juliet is the very soul of girlhood. I try to infuse my interpretation with the spirit of adolescence. It is obvious, of course, that I cannot play the part physically like a fourteen-year-old child. This girl, Juliet, was oh, so tremendously, so irrevocably in love. Singleness of purpose, limitlessness of devotion, mark her every thought, word and deed. That is all very human, very feminine, as any girl could tell you if she would. She doesn't often tell, of course, for fear of being ridiculed in this prosaic age, but there are many men that know it."

Miss Cowl feels that she has been in a sort of training for Juliet in all her other rôles.

"There was a great deal of Juliet," she explained, "in the rôle of Jeannine in 'Lilac Time.' Another phase of love was brought out in 'The Crowded Hour' in which my rôle was that of an impetuous, high-spirited and sensitive young woman, a New York chorus girl, who ran away to France to join her lover in war times. As Moonyeen Clare in 'Smilin' Through,' I played my first death scene.

Juliet Will Always Live

"JULIET will always live, because she represents something that all women have at some time or other looked to as an ideal; something that all men at some time in their lives have worshiped. There is a trace of Juliet in all women, even in the most practical, the coolest and most sophisticated. I suppose, too, that all men can remember a time when they were Romeo. As we go through life most of us lose those spiritual qualities that make us great lovers, the innocence and the forgetfulness of self. But it is good to have a flaming idea, and few of us grow so old that we can remain unmoved by the ardor of Romeo and Juliet."

"Would a girl nowadays have the courage to drink that potion and go into a tomb to await her lover?" I asked.

"Oh, girls are much more courageous in some ways than the old-time, repressed Italian girls," answered Miss Cowl. "I'm sure they would do so with even less perturbation than did Juliet. However, life conditions aren't so difficult for women in these days and fathers have so much less authority that it is quite likely Juliet nowadays would merely elope with Romeo."

I asked Miss Cowl to tell me something of her feelings about the rôle of Mélisande and she drew an interesting comparison.

"The Juliet of Shakespeare and the Mélisande of Maeterlinck are both victims of tragic love," she said, "but no two characters could be more unlike except that the poets have infused into both an appealing quality of adolescence. Both Juliet and Mélisande glow with the white flame of passionate love. But one never senses for a moment any realization of a sex complex in Juliet. In Mélisande, however, the thought is ever present. Nevertheless, Mélisande in the imagination seems a more spiritual entity than Juliet. The reason, perhaps, is that the history of Juliet is an open book from the outset. One knows all about her and her family, her relationships and environment.

The Timid Melisande

"MÉLISANDE comes to us out of the mist of uncertainty—lost in the woods, where tangled underbrush and tall trees cast strange shadows. Juliet's story begins in scenes of light and color and garish sunshine. Her singleness of purpose makes her a symbol of unwavering love but her reactions are those of a girl in any age. She sees Romeo and loves him. But for the intrusion of parental authority they might have married and lived happily ever after. There are no mental complexities to interrupt the development of natural human affection. With the first meeting with Romeo the floodgate of passion is opened. Juliet has a momentary fear that Romeo may be married but this is not tragedy; it is the impetuous longing of one in whom the fire of love has been newly kindled.

"Mélisande, on the other hand, when she first encounters Golaud is timid and shrinking. She threatens to throw herself into the well if he but lays a hand on her. Obviously the feminine sensibilities have suffered a shock previous to this moment. And throughout most of the scenes with Pelléas her instinctive passion is retarded by a sense of impending ill. She has married Goland but not until she meets his brother Pelléas is the sex instinct in her deeply stirred. Even then she fears it but she is not strong enough to resist its power. She is exquisitely lovely and lovable. And one loves her in spite of her weakness.

"It is impossible to imagine Juliet in a like situation; our hearts go out to her as a symbol of undying affection and absolute devotion."

Danes Quit Grain for Dairying, Save Nation

Facing Economic Disaster, Farmers Shift and Win Success

By HUSTON THOMPSON

THERE are usually representatives of the co-operative movement on board the boats plying between England and the Danish Isles, for Danish co-operators have their offices and representatives in the British markets and are frequently traveling back and forth. In fact, they are a competitive nightmare to Irish and English interests.

The morning after my arrival I visited the local butter plant and with the director, Mr. Hajbjerg, passed from room to room of his establishment. At the outset he hurled figures at me that might have challenged his veracity had I not been somewhat prepared.

Think of a territory much less in size than the state of Maine that supplies forty per cent of all the export butter in the world's markets. This product is produced from the milk of cows that feed on some two hundred thousand farms, averaging each about forty acres.

My guide informed me that his organization handled for export the output of seventy-three dairies. This consisted of one hundred and eighteen thousand casks of butter of a hundredweight a year. Forty-five per cent of this is sold in the English markets. The remainder goes to Belgium, France, Switzerland, Holland, Norway, Sweden, Italy, Austria, and a small amount to the United States. He gave me to understand that they were watching the United States markets keenly, and the moment there was an opening for his product, it would be on the way. During the year ending June 29, Director Hajbjerg stated that Denmark had exported two million five hundred thirty-seven thousand kilograms of butter. Of this, 2,167,000 kilograms was manufactured by the co-operatives.

No Coloring in Butter

ALL the casks of butter were stamped. This stamp is granted by the government to dairies which meet certain tests, that are applied several times a year to each dairy. Failure to comply with the requirements means cancellation of the government certificates which eliminates the butter for export and practically excludes it from the domestic market.

As I saw before me the thousands of casks of golden butter, I suggested coining the color into a catchy phrase, just as the raisin people of California adopted the picturesque description of the "Sun Maid" raisin. The director informed me that the color must have come from the sun, too, since the butter contained not a particle of artificial coloring matter.

From the butter factory, we passed to an adjoining egg co-operative which is used by many of the Danish local societies for the exporting of their eggs. Here were women testing eggs for their purity by electric light, and girls counting, packing and preparing them for shipment, the money for which generally finds its way into the pocketbook of the farmer's wife.

Denmark exported this last year 17,300,000 eggs. About fifty per cent of them were handled through co-operative associations and almost ninety-five per cent went to England.

These performances of the Danes particularly through co-operative methods have no legerdemain about them. They do bear the earmarks of the epic of a simple people whose praises have rightfully been sung.

This short stocky race of peasants have met their armageddon on at least three occasions. Once in a battle against nature when they actually made the soil grow with fertilizers, crop rotation and back-bending effort.

A second armageddon occurred in 1868, when, after a struggle with the combined forces of Prussia and Austria, they were compelled to cede their southern territory known as Schleswig-Holstein. On that occasion they made their national slogan, "What we have lost without we must gain within."

This they did in fact. In about fifty years these peasants have restored two thousand five hundred square miles of waste land which was about what they lost in tillable soil to Prussia and Austria in 1868.

The Jutland Country

ON LEAVING the Jutland coast, I was surprised by the nature of the country before me. Within a very short distance, we encountered splendid forests of spruce which today are harvested by the farmers in co-operative organizations. The peasant has literally conquered the soil once covered with magnificent trees but laid waste by wars and captured by wind-blown sands off the sea coast, through reforestation, fertilization, and irrigation or drainage. Instead of two hundred square miles of forests, which then existed in Jutland, there are now seven hundred square miles.

This battle with the elements that sweep in from the angry and fretful North Sea was won under the leadership of an engineer by the name of Dalgus whose memory is marked by a stone monument out on one of the heaths of Jutland. Upon it are written these words: "The King of the Heath and True Friend: Reco Myleus Dalgus."

The third armageddon was brought upon the Dane by the American farmer. As our country opened up its rich alluvial or mesa lands to the wheat-growing farmer, who exported his grain to Europe, the Danish peasant suddenly discovered that he was hopelessly outclassed in raising grain on his poor soil in competition with America.

Instead of blindly fighting this economic battle and going down to utter defeat, he out-flanked it by quickly turning from grain production to dairy production, and bought our grains for his cattle. Simultaneously with the decrease in the acreage which he had in cereals, he increased the output of the acreage which he still retained for grain, and added to his food supply by planting root crops and potatoes.

In the first four months of 1923, he purchased 233,000 tons of oil cakes from the United States, of which forty-five per cent was bought through the co-operative importing societies. During the same period, he imported 139,000 tons of corn, of which we sold eighty per cent.

As an example of a whole nation shifting its ground and facing right about from economic disaster to world supremacy in butter, I dare say the like has never been surpassed.

Conditions have now reached such a point that a group of six Danes, three from the co-operative organizations and three representing individual traders, meet once a week in Copenhagen, scan the world's butter market and name the price of butter at least for Denmark if not for the world. I do not press the point as to whether it is wise to exercise such a power in this way. In fact, I heard some slightly adverse discussion about it in Copenhagen. Certain it is, however, that if Denmark is interfering with the law of supply and demand in a detrimental way, there are interests in other nations of the world that could bring her to time. The farmers of Denmark have brought this situation about without a single law on co-operation being placed on their statute books.

An interesting side light on the whole farming situation is that the Danish farmer is a free trader all up and down the line, although many of his city brothers desire a tariff.

In Copenhagen, I asked Arne Holm, Secretary of the Agriculture Council of Denmark, an organization which assists the farmer in somewhat the same capacity that Plunkett House acts for the farmers of Ireland, and Holyoake House for the consumers' co-operatives in England by spreading the propaganda of co-operation and giving aid to their societies, to explain the success of the Danish farmer.

He replied, "Because the farmer has through co-operation made his calling one that is not only admired by the intelligent city folk but one in which the farmer himself takes pride."

Through elevating his profession, he has elevated himself, and has practically eliminated farm tenancy, one of the biggest curses of co-operation. With ninety per cent freeholders, the picturesque figure of the land baron has passed.

Gruntvig His Hero

SO GREATLY does the farmer believe in his own calling that instead of having a soldier for a hero, he has chosen the one who has done the most for agrarian life. I found his hero was a theologian, poet, and practical philosopher whose name was Grundtvig. It is his picture that hangs on the walls of the farmhouses, in the agricultural schools and the folk high schools.

Grundtvig believed that deep down in the souls of the peasants of Denmark there were spiritual aspirations that if quickened would lift them up to heights where they would find themselves as a nation. When they reached these heights, it was inevitable that material things would be added unto them. He saw that from time immemorial a Latin or German Kultur has been pressed down on the peasants' brow. They could only arise by throwing off these foreign influences and making their own dreams come true. The dreamer Grundtvig then became practical.

Instead of teaching his people to be practical through the study of practical subjects, he urged that the way to become practical was to arouse the spiritual. In fact his followers today boast that the folk high schools which resulted from his influence do not teach a single thing that will bring direct returns in money. What a jolt such a suggestion would give to the curriculum in many of our American colleges if it were put into effect!

Grundtvig pointed the way by emphasizing the necessity of the Dane learning who he was and whence he came through history and folklore; that his spiritual aspirations could be aroused through song. He would grasp the spirit of freedom through learning to love freedom both in action and thought. He could love his country only through kinship with the soil.

Undoubtedly the practice of his teachings has welded the farmers of Denmark into a unit with but a single thought—the development of their nation along ideals that came from contact with the soil. The seed which Grundtvig sowed has since flowered into the pride of Danish peasantry—the folk high school, the institution that has taught them the value of co-operative action.

A short distance from Roskalde where all the Danish kings have been buried is located one of these folk high schools. The spot selected is the crest of a hill which looks out upon a scene that both from historical interest and natural beauty cannot fail to arouse even the passing visitor. From the grounds one beholds a vast sweep of land penetrated by the Roskalde Fjord, probably the most famous in all Danish history, for it was here that the Vikings held sway, selecting it as a place for rendezvous.

None of these schools was founded by the government, and no assistance was ever given them until they had reached a stage of success. Here every year young men from the farms and villages between the ages of eighteen and twenty-five come for a period of three months to study what some one has termed "the humanities."

After their term of study is completed, they are followed by the young women of a like age who stay for a period of six months.

To my question as to why they selected students between the ages of eighteen and twenty-five, he said in his country the boys and girls usually attended school until they were fourteen. Then they worked on the farm until they were eighteen. It was the idea of the founders of these schools that somewhere between the ages of eighteen and twenty-five after adolescence, and after four years of hard toil, there came a period of reawakening with a longing for spiritual knowledge. It was at this critical stage that youth could be molded, and its attentions directed more successfully to higher thinking than at any other time. He asked me to note particularly that these schools in no sense pretended to be a university. They simply responded to the longing in the youth of that age by opening up to him the visions of the goal for which his race had been struggling.

No Illiteracy in Denmark

AT THIS juncture, I interrupted with an inquiry as to how such training accounted for the co-operative spirit.

"You shall see by the results," said our host, the Reverend Vedal. "In the first place, we have no such thing as illiteracy in Denmark. Learning along the lines I have indicated has become a fetish in our national life. The practical effect of the sojourn here is that the students do not return to the cities. In fact they have no desire to do so. Back to the farms they go with one controlling thought—that the rest of the country must be aroused as they have been aroused. They organize in small towns and villages what you in America might term community centers. To these they bring lecturers from the teaching forces of folk high schools, agricultural schools and our university.

"The students leave here with the peasant shyness displaced by a self-reliance, courage and spirit of team play with the other fellow. If you were to ask me what are the three most necessary essentials for successful co-operation, I would name these three.

"Another thing they learn here in their study of our political life is the democratic idea which they apply to the co-operative movement, that there shall be only one vote for one person, and that our representative form of government is adaptable to the co-operative movement."

Riding along the well-kept roads toward the agricultural high school, we passed many herds of Danish cattle with each cow tethered in a line across the field, and all moving together like an army, cropping the grass as they went, and followed by magnificent horses who cropped the grass which the cattle had left. When the cows had crossed the field, the grass was sufficiently long for them to start over again. Who but a Danish peasant would have devised such a method for garnering the last blade of grass and at the same time saving the field, and who but a Dane would have thought of blanketing the cows as they feed, with the care that one would give a Kentucky thoroughbred!

These agricultural high schools, of which there are more than twenty-two scattered over Denmark, are very modest in appearance with equipment that is inexpensive. Here the young men and women come for courses of about nine months. They dwell in very simple dormitories, studying daily the essentials that will equip them to be practical farmers or efficient farmers' wives. Special courses in dairying are taught and the opportunity of learning how to manage them is given. Many of the schools have been originally owned, at least in part, by the principal in charge, but the farmers in the neighborhood take a financial share and therefore an intensive interest in the upkeep. In addition to this they are supported by small fees that the students pay and any endowment that they may have been fortunate enough to obtain.

Farms Average Twenty-five Acres

SO MODEST is the budget of many of these schools that their teachers are compelled because of lack of funds to supplement their salaries by purchasing or leasing neighboring farms on which they work and from which they get sufficient produce to make it possible for them to live.

Next to the living room in the farm homes of the graduates there was the farm office where my host placed on the table his latest cost accounting sheets. These revealed how many hours had been spent by him and his assistants on each product and I was informed that he could if necessary demonstrate just what profit he had made on each square foot of the land. In the county in which Copenhagen is situated there are more than four hundred and fifty farmers who keep such accounts.

Twice a month these accounts are audited by an official known as the county councilor. He occupies a place in the agricultural life of Denmark similar to that occupied by our county agent. When I inquired what practical value he got from carrying on such intensive bookkeeping, the farmer replied that it not only advised him as to when and how to keep out of the debt column, but also that it was of great utility in determining how much he should be taxed. The assessors were accus-

Mah-jong—Game of the Chinese Dope Fiend

Taboo in Country in Which It Originated, Finds Place Here

By DONALD STRICKLER

PUNG—Chow—Mah-jong!—America has found a new amusement. And what could be more romantic? To begin with, it is "Made in China"; it includes counters which look like chopsticks; there is all the mystery of a magician's cabinet; with it are little blocks of polished ivory or bone and bamboo dovetailed together. The characters on these Chinese dominoes are dragons, circles, bamboos, winds, flowers and seasons.

But the members of our élite society, sitting down to their afternoon Mah-jong clubs, little guess that it is opposed by government and moral influences in China and that it is being played only by street denizens and dope fiends in the gambling resorts and opium dens. The Mah-jong gamester in China has about the same status as a bootlegger in the United States.

Students of American universities enthusiastically receive this novel game into their fraternity homes, but do not know and are not told that in China Mah-jong—more than immorality—has ruined the lives of multitudes of students and caused them to drop their books.

Chinese Christians are expelled from their churches for playing this game.

After the World War it was found necessary to explain to the East why the so-called Christian nations of the West had been grappling at one another's throats. It seems that now we are facing a similar paradoxical situation. A group of Chinese Christians are saying that America and England are setting China a bad example through the introduction of Mah-jong as a social institution. The National Christian Council of China has written an open letter to the Federal Council of Churches in Amercia, concerning the vogue of the game here. The following statement is quoted from this letter:

Against Law in China

"MAH-JONG is almost invariably played for money. The stakes are often very high, and as much as $1,000,000 has on occasion been lost or won in a night. It is played by all classes, but broadly speaking it is not countenanced by Chinese themselves of high moral standing. To our great sorrow, the practice of playing Mah-jong for money is increasing not only in China generally but in the Christian church. This increase in not a few cases can be traced to the fact that the game is being now so largely played in the so-called Christian countries, which is supposed to give a certain sanction to its use by Christians here.

"We do feel that in view of the terrible curse to this land which comes through gambling, and in particular through this form of it," whether enlightened Americans ought not to consider the effect of the Mah-jong craze.

"It seems anomalous to say the least," comments Daniel S. Dye, a missionary who is in America on furlough, "that America should take up the game that is taboo in China."

This taboo comes not only from the church; the government, as well, recognizes the menace of Mah-jong. *It is against Chinese law in many portions of China to play this game in public.* A student who has recently returned from the Orient even *found it impossible to buy a set of Mah-jong in Peking.* He was told upon inquiry that it was not on sale.

The actual condition has been brought to students in American universities by a Chinese girl who is about to receive an advanced academic degree. She tells us what Mah-jong has done to her own neighbors; that many of them have even lost their houses as stakes in their gambling.

"I know what this gambling game has meant in China," she says. "I know what it has done to my own neighbors and I hate to see it coming into America.

"I'll tell you about one of my neighbors in Nanking, China. He had always been a very industrious man, a shoemaker by trade. One night he was tempted into a game of Mah-jong. Before the year was over he had lost his shoe shop, so, to pay back his losses, he began to rob. Soon after this he was caught and put in jail."

"Do you think this man is an exception?" I asked.

"Oh, no," she replied, "he is only one of thousands. Just now I am thinking of two more of my own neighbors, one a lumberman and the other the owner of a tea shop. Both lost large fortunes playing Mah-jong.

"The greatest gambling time comes during the two weeks of vacation, beginning with the Chinese Twelfth-month, or Chinese New Year's Day, which corresponds to the fourth day of February this year. Just before I left Nanking on last New Year's, the father of my roommate lost two thousand dollars in one evening. The next night he tried to win his money back and instead lost five hundred more."

Addicts Not Trusted

"WHAT do you think there is about Mah-jong that makes it so fascinating?" I asked her.

"It is the possibility of winning back all the money in the next hand. The Chinese keep on playing all night long in many cases, hoping that each hand will be their lucky one. When they see their fortune slipping away from them, they get so mad! You may not believe me, but one man grew so angry over his great losses, that he cut off his right hand so that he could never play again. And before many moons he was playing with his left."

Rev. George Stenz, S. V. D., now on a furlough in this country after thirty years' experience in China, corroborates this statement. He also tells of many Chinese who have lost their entire possessions by playing the game. Having lost their fortunes, they become bandits and robbers. According to Reverend Stenz:

"If you get the Mah-jong fever in China, you no longer can be trusted.

"It is a great surprise to me to note how rapidly the game of Mah-jong has gained such popularity in the United States. Mah-jong is the game blamed for the present corruption in China. I know men and women in China who have lost their entire possessions playing this game. There are few games so contagious, and I am sorry to see it getting such a hold on America.

"In China is a saying that the victim of the Mah-jong habit can no longer be trusted. It is a sure thing that he will soon 'come under the wheels.'

"This pastime that the Chinese have sent to Americans is not a felicitous offering. I know how many young Americans are fleeced over there by their Chinese friends in this game. I also recall from history how the Chinese have been long accustomed to overcome their opponents by making them presents, when they could not beat them in the play in any other way.

"In order to ruin others they have had recourse to two other methods—women and gambling. The Prince of Lu, who, owing to the tireless labors of Confucius, had made his kingdom a model state, was induced to give up the performance of his duties and the business of government by being presented with pretty girls with whom he played cards, and of the Emperor Kwang Hsu it is said that his aunt, Empress Tzu Hsi, who perceived that the young Emperor was engaged in working for reform, led him by means of Mah-jong to a life of idleness."

Whether played for stakes or not, Mah-jong is essentially a gambling game. The game originated with this purpose in view. In the first place, it is to be played singly. There is no teamwork. Responsibility for losing or winning devolves upon each individual player. Every possible device has been worked out to intensify the element of chance. From the small dice to the building of four walls, every possibility of controlling the draw is eliminated.

The most insidious gambling element, however, is to be found in the system of counting. The whole game is built around this ingenious system. The original count may be very small, but the principle of doubling or pyramiding the score may easily run the number of points which can be won into four or five figures. There are many different stipulations for doubling the score. Some of these doubles may be partially controlled by skill, but the element of chance is always predominant. The person who happens to be "East Wind" has his total score doubled. The mere drawing of one's own Flower or Season doubles the score. The same is true if three or four of one's own Wind are drawn. The main fact lies in the possibility of winning back, or losing, in one or two hands, the results of a whole evening's play. If stakes are not used, the game hinges around piling up big scores and winning. The nickname "Just One More" holds good in either case. One more round, so that the evening's laurels may go to you instead of the other fellow. One more chance to be "East Wind," which means winning (or losing) a large number of points.

Mah-jong is one of the oldest Chinese gambling games. It was first played with cards, and it is only within the last fifty years that the little domino-shaped blocks began to be used. Tourists became interested in the game and it soon became a popular source of entertainment on shipboard; thus the game was introduced into this country. The sets are now manufactured here. The blocks are made from paper, wood, and vulcanized rubber. But the most fascinating are those made from Chinese bamboo and bone dovetailed together. The importation from China has been enormous. The bone supply of China was exhausted and a shipload of knuckle bone from the Chicago Stock Yards was sent to that country to fill the shipments on order.

Simplified for America

MAH-JONG is sweeping America as if by storm. As played in China, the game is scientific and complicated, but the American rules have simplified it to the extent that everyone can play it; even children as young as five and seven years are known to have learned the game, after a fashion, in one evening. They are attracted by the pretty blocks and cry for them as they would for toys. It has gained a ready entrance into many clubs in our cities. Men who sit down at the lunch hour to play for a short time find themselves spending the afternoon. They have given it the name of "Just One More," because it is so easy to win back their whole evening's losses during one hand.

There is certainly no denying the fact that Mah-jong has become tremendously popular in this country. During the Christmas season thousands of sets were sold in one department store alone. Last year it is said that the sales of Mah-jong sets and accessories amounted to millions of dollars. The game is being widely advertised throughout the country. Mah-jong classes are announced from the windows of the shopping districts of our cities. Many daily newspapers are conducting instruction columns in Mah-jong.

Is it only a passing fad, or is it destined to menace the West as it has the East? Various opinions have been expressed. The situation is, at least, important enough to call for a knowledge of those facts about Mah-jong that are above set forth.

The Story of Sulphur, Essence of Combustion

Concluded from page 5

she has given in a prodigality of wild fowl and animal life that stirs the sporting instinct.

While there is, as has been said, a marked affinity as between oil and sulphur exploration, the two operations are never conducted jointly beyond the drilling stage. It is a matter of geography with relation to mobility and finance. In oil, the wandering wildcatter brings in a well and the pipe line comes hastening to carry the oil away, in some cases hundreds of miles. In sulphur, an expensive steam plant must be erected immediately above the deposit. Because the action of air upon hot liquid sulphur is, inexorably, to cool it, and, cooling it, to restore it to the original crystal state, 1,200 to 1,500 feet is the farthest distance it can be pumped without expensive "booster" stations along the route of the pipe line; and the operation must be continuous—twenty-four hours each day until the well is pumped dry. A large financial investment is therefore necessary. It is a game for the chosen few, accounting for the total absence of blue-sky speculation with its pathetic wake of ruined widows and departed Liberty bonds. But, for the chosen few, it is a profitable game. Last year one of the American companies paid a fifty per cent cash dividend on its capitalization, and its stock is quoted on the New York Stock Exchange at six for one.

Salt water lurks in the limestone formation. Salt water is the oil man's nemesis, but Frasch robbed it of its terrors in the sulphur game. Bleed wells carry it away. As the sulphur is boiled out of its limestone veins and pockets, the fissures thus created are flooded with salt water seeking an egress. A bleed well located among a group of pumping wells (it is generally a worked-out sulphur well) provides the egress, and the salt water, subdued and harmless, is pumped out on the ground.

Will the Treaty of London prove advantageous to the trade? Dominating the world markets, will the Americans be tempted finally to emulate the policy which brought Sicily to ruin?

Let H. R. Wemple, of New York, answer. Mr. Wemple is sales manager of the Texas Gulf Sulphur Company, and a golf fan. I overtook him as he was on his way to the links, and discreetly talked golf shots with him, and yes, between times, sulphur.

"The price on raw sulphur today is below the pre-war price," he said. "It is fourteen dollars to sixteen dollars a ton at the mine, and eighteen dollars delivered at the Atlantic seaboard. The lowest delivered price ever known, in 1897, was seventeen dollars thirty-seven cents; the highest, 1906-18, was twenty-two dollars. If the price of twenty dollars throughout the period of the war was nominal, that was not our doing—all commodities, sulphur included, were caught up in the violent wave that completely overturned equilibrium in trade, in view of the enormous demand for everything.

"If raw sulphur prices were unduly increased, the trade would again turn to pyrites and we would follow Sicily to ruin. There are deposits of pyrites scattered generously throughout the world. Pyrites, zinc ores and waste gases account for fully fifty per cent of our sulphuric acid production at the present time. While the sulphur content in pyrites is only fifty per cent, the residue has a value as iron ore and may contain enough copper to pay for the recovery of that metal.

"Spain is now dumping iron pyrites at our Atlantic seaboard at $11 to $12 a ton, and it hurts. As late as 1921 Spain's exports of pyrites were one and three-quarters million tons. At the present time the Spanish exports to this country don't exceed 200,000 tons—but the competition is ever there.

"The price on raw American sulphur is fixed in the export markets according to the cost of production. It is not set by the lowest-cost producer, but the highest-cost producer. In the domestic market it is strictly competitive and governed by the law of supply and demand. While we permitted the Sicilians to live by admitting them into the export agreement, we are watchful, over here at home, that we ourselves live."

The general manager's secretary drove me from the plant to the railroad station twenty-eight miles away. His big automobile plunged so swiftly over the smooth shell road that the cottages of the company town were quickly lost to view. Soon all that was left to see of the operation were the bins, three of them, side by side, one million tons of sulphur above ground, worth fifteen dollars a ton. It was wealth, frank and crude, heaped on the Texas prairie.

Wealth, frank and crude . . . . but behind it a story that had its beginnings in the Orient before the western world knew the consciousness of nationality. The Orientals scraped along the sides of volcanic mountains with crude implements for their sulphur. The Americans shoot hot water a thousand feet into the earth for theirs.

'Turkey for Turks' Brings Wholesome Changes

Country Rid of Aliens and Natives, Without Money, Effect New Deal

By SAMUEL CROWTHER

HERE are some facts to set down about Turkey. The first is astonishing. To anyone who has been around Europe much since the war, it is incomprehensible. Nevertheless it is a fact that Turkey has not received and does not want a loan from the United States or anyone else. That one fact puts her in a class alone. Turkey, having sided with Germany in the Great War, was so completely down and out when the peace came around that the Great Powers, who had been hovering about like vultures, simply proceeded to divide up the dead body without even bothering to ask the Turk what he thought of the proceedings. Yet, and this is the second big fact, Turkey has now recovered the borders she had before the war and is today freer from foreign influence in her affairs than she was then. The third fact is that in the general shaking up she has brought to the surface in Kemal the ablest man next to Mussolini that post-war conditions have produced. The fourth fact is that under Kemal the country is trying one of the most tremendous experiments of modern times. It has completely changed its government, it has had a house cleaning on a grand scale, it has physically thrown out all of the foreign elements of its population, and has not only said that Turkey is henceforth to be for the Turks, but has put the policy into force. The final fact is that while other countries are whimpering for help, Turkey, with fewer resources than any of them, is committed to doing with what she has.

We Are Misinformed

HERE in America we know very little about the Turks and what little we know is highly unfavorable. We have a low regard for their honesty. Nearly everyone has been cheated by some gentleman in a red fez presiding over a Turkish bazaar at a seaside resort or a country fair. Tourists will tell you how they have been cheated in the big bazaars of Constantinople. I well remember a long bargaining match I had twenty years ago over some hand-wrought brass bowls in a big bazaar. The merchant wanted ten dollars apiece for them. I countered with a dollar, and then by easy stages I went up to two dollars and he came down to three. There we stuck and I left. I had not gone twenty yards before he caught up with me, bearing the bowls.

"Take them, take them," he cried, despairingly, "My wife is sick, my children are starving. I must have money. I am giving them away, but take them."

I took them. When I got home some months afterward I found that my unique, handmade bowls had been stamped out of some composition scrap metal in Germany and were a commodity in our five and ten cent stores. But the man who sold me those bowls was not a Turk, although he wore a fez. The men who run the side shows in bazaars in this country and who pass for Turks are not Turks. It used to be the rule that every subject of Turkey had to wear a standardized red fez. But comparatively few Turks were ever in business and none of the few who were in business came in contact with tourists, much less did any of them venture abroad to engage in commerce.

In Constantinople and in Smyrna practically all of the business was in the hands of Jews, Greeks, Syrians, Armenians, or that mixture of all races which is known as Levantine. Even the officials of old Turkey were not often Turks. From time immemorial the true Turk has had only two occupations. The one was fighting, the other was farming. Never having had a head for business or finance and never having cared to learn much about them, the Turks left such things to the Jews, Greeks, and Armenians. Another thing we had against the Turks was their heathenish addiction to Mohammedanism in spite of the missionaries we sent among them. Most people do not know how nearly impossible it is for a Christian to turn the Mohammedan mind. Mohammedanism not only embraces a large part of the essential doctrines of Christianity but also it accepts Christ—as a prophet. They merely say that Mohammed was a prophet who came after Christ.

Turk a Fatalist

THE Turk is cruel. There is no doubt about that. He has not the slightest conception of our kind of civilization and he is a fatalist. His background and his history are war. He is a magnificent fighter. A few centuries ago he took Constantinople and swept over half of Europe and he held Rumania, Serbia, Macedonia, and Bulgaria until fifty years or more ago. All these states have been remade out of what was once Turkey in Europe. Ever since the Turk got into Europe he has been up against European diplomacy and he is quite generally blamed for doing unto others what others do unto him.

The United States is the only great power which is in Turkey with clean hands. We have always taken in more than we have brought away. In Robert College on the Bosphorus and in Constantinople College we have established the largest two educational institutions in the Near East. They are supported with American money and manned by American teachers. Our educational investments in Turkey are probably in excess of ten million dollars. In addition to that, through the Near East Relief, we have sent many millions of dollars into Smyrna, Armenia, and other parts. The Turks do not as a rule partake either of our education or of our charity. The Turks always look after their own poor. And, although they think we spend our money foolishly, they do respect our disinterestedness.

It always has been hard to get into Turkey. Even before the war, when the passport craze had not struck Europe, one had to have a passport to get into Turkey and a special passport to travel within the country. Now it is many times more difficult both to get in and get out because, until late in the autumn, Turkey was still technically at war with all the Allied powers and maintained few consulates in Europe. I applied at the Turkish Embassy in Rome for a visé to Constantinople and learned that none could be issued without a special permission from the seat of the Turkish Government at Angora. This would take five days and, as far as I could learn from the embassy, this was one rule which had to be obeyed to the letter. Perhaps it was, but, knowing that red tape can usually be unwound, I managed to have the embassy issue instructions to the Spanish Consul to give me a visé for Constantinople—the Spaniards being in charge of Turkish consular affairs. But that visé is only part of the story, for at that time Constantinople was occupied by French, British and Italian troops.

We left Sofia on the Orient Express—one of the famous trains of Europe. Now, however, the word "express" is used in Eastern Europe to distinguish a train which will certainly some time arrive at its advertised destination, from the ordinary train which may never arrive. Only a single line of track connects Constantinople with Europe and over that track had gone most of the German troops and munitions during the war. On the best stretches we could make twenty miles an hour; over the worst stretches we simply crawled. The line had no facilities for repairing engines or rolling stock. Our engine sounded as though it had lost one lung and acted as though it had lost both. The right-of-way was strewn with broken-down freight cars, mostly with German markings on them. On the sidings stood gaunt, disabled engines. And then, as we neared the Bulgarian border, the military began to appear. First the Bulgarians had to examine our permits to leave Bulgaria. Then the Greeks had to have a look at our papers—for the railway crosses a little strip of Greek territory—and then the French had to see that everything was all right from the standpoint of the Armies of Occupation. All the way down the line from the Bulgarian border to Constantinople were Greek and French troops with all the usual paraphernalia of field guns, horses, motors, and motor trucks.

Allies' Record Sorry One

MOST of the soldiers were very young men and the wonder was what these boys were going to do when they got out of the service, for there is nothing so demoralizing as the dead idleness of an army of occupation. The wonder was further increased when we reached Stamboul and found the streets simply filled with Allied soldiers and sailors—and mind you, this was five years after the war was supposed to be over. And out in the Sea of Marmora stretched line after line of Allied warships and destroyers. All these troops were out there, not to hold the Turks in check—although that was the ostensible reason—but to watch lest one Power gain an advantage over another. Which brings one to the unsavory mess of the Powers and Turkey after the war. The record is a sorry one; the only fortunate fact is that the United States did not participate in any way. We have had a flotilla of destroyers and about a thousand sailors out there under Admiral Bristol; but under the Admiral's able guidance we have managed to keep out of all intrigue and attend strictly to our own affairs.

The Allied Occupation of Constantinople is now over. It provided one of the best of all examples of just how sordid European politics can be.

After the Mudros Armistice of October 30, 1918, which ended the war in these parts, Constantinople was occupied by Allied troops, the French took Cilicia and Syria, the Italians went into Adalia, and the Greeks occupied Smyrna. The Allies were so busy at Paris with the Treaty of Versailles that they did not get around to the Turkish treaty until late in 1920. Then they quickly at Sèvres cut up Turkey, dividing practically all of the country into five spheres of influence, in which Great Britain, France, Italy and Greece were to do the influencing. The division was not very satisfactory. No one of the countries got what it wanted most and there was also the problem of Armenia, which had previously been rolled up in a parcel and offered to the United States. We had refused to exercise the mandate and this was embarrassing to the Powers because it left on their hands the worst lemon in the assortment.

The foreign statesmen had assumed, not without reason, that Turkey was dead and had not paid much attention except to see who got what. The Turks were far from being dead. Mustapha Kemal Pasha had formed a government at Angora and rallied round him all the soldiers he could find. They were ragged—but they had their backs against the wall. The Greeks started in to thrash this government and incidentally to acquire some territory. For a time they had success and the success went to their heads. They pushed on to Angora and also sent an army through Thrace to take Constantinople. The Allies stopped the Constantinople push and the Turks began to wake up and rapidly to beat the Greeks back until they had them in utter rout. The secret part of it all is that Greece was being furnished with munitions by Great Britain, while France was helping out the Turks. Lloyd George thought a Greek dominance over Turkey would mean an English dominance over the oil fields. The French thought Turkey was a better bet. Thus, while France and England were ostensibly working together, each was secretly trying to whipsaw the other and Italy was on the outside looking to see what she could get.

Knew What They Wanted

THE Turks came right on to the Dardanelles and were lined up against the British troops there when an agreement was reached between the Turks and the English. The French could not hold the advantages they thought they had gained, while Kemal quickly saw that he was in a position to do what he pleased. The Turks met with the Powers at Lausanne to revise the former treaty. The Turks knew what they wanted and would not budge an inch. The first conference broke up in a deadlock. In the second conference the Turks were just as determined as before but they gave way on a few minor points and came out with a treaty that recovered to them everything that had been lost in the war except the control of the Dardanelles. One of the comical features of the conference was the French debt. Turkey before the war owed a large sum of money to French bondholders. At the conference they proposed to pay this off in French francs—which meant that they would pay about one-quarter of the gold value. The French were shocked and insisted on gold. The comical feature is that all of the nations at this conference who were trying to explain to the Turkish representatives the enormity of paying less than par, owed money to the United States which they had repudiated in all but words!

The Turks have a thoroughgoing program. They have been bothered so long by other nationalities in their midst that they have set a time limit on foreigners doing business in Turkey. All the Greeks and Armenians have to get out, while all the Turks in Greece, and Macedonia, and Bulgaria have to come back. Some two million people are being exchanged. No man who is not a Turk can hold office. All signs have to be in Turkish. It is proposed that all Turkish business be attended to by Turks—even though very few Turks have ever been in business. For the old rule of the Sultans has been substituted a kind of republic, with its headquarters at Angora. Absolutely a new deal is on.

Danes Quit Grain for Dairying, Save Nation

Concluded from page 10

tomed to make their estimates on the showing from these farmers' accounts.

The small farms of Denmark number 109,000 with a total of one million three hundred thousand acres. Thus they contain less than 24 1/2 acres each. The second class with 91,000 farms covers six million two hundred thousand acres with an average size of less than 147 acres. Only 5,000 farms with a total acreage of 1,800,000 acres are above 147 acres in size.

I found that many of the farmers were members of many different co-operatives. One society handled their eggs, another bacon and still another their dairy products. On the other hand, they belonged to any number of buying co-operatives. It occurred to me that the farmer would spend too much of his time attending co-operative meetings. Also the thought suggested itself that the various selling co-operatives could with a saving be brought together under one head and a like scheme could be fashioned for handling the purchases of necessaries for the farms.

But the experience of the Danish co-operatives was against me. First of all they delegate a great deal of work to their representatives. They agreed that theoretically by such consolidation one could save time, but in the practical working out of such a plan, it was a failure. Their general idea was a separate co-operative for each product. The moment that the managers had their attention distracted by attempting to get into the market with different products, calling for different knowledge and different conditions, the farmer had found that the mental spread was too great for their representatives.

I would not convey the idea that the Danish peasant is no longer confronted with difficulties. The drop in prices in 1921, particularly on farm products, according to an investigation made by the Danish authority, Mr. Harald Faber, caused the net profit of the farmer of Denmark to shrink from 8.6 per cent to 1.2 per cent. If it had not been for the co-operative assistance he would undoubtedly have been financially prostrated.

One of the most unique results of the co-operative spirit of these farms is that they have become almost directly independent of the hazardous speculative methods of city banking. Denmark has had perhaps the largest bank failure in proportion to the size of its population in modern times due, so I was told, to speculation on the part of some of those in control. The Landmans Bank failed with a loss of eighty to one hundred million dollars. Comparing the population of Denmark with 3 283,000 persons, to that of the United States with 110,000,000 persons, the loss would be equivalent to the whole banking system of New York and Chicago going into bankruptcy.

Despite this situation and the fall in the price of farm products, according to the latest figures obtainable, the Danish farmer still is able to show a profit. What more can be said for the practical effect of a movement that was produced by farmers because of economic pressure through a spiritual appeal to an enlightened peasantry?

British Propose Naval Base at Singapore

Huge Expenditure Looked Upon by Admiralty as Necessity in the Pacific

By W. P. CROZIER

WHEN the Washington treaties were signed most people in England heaved a deep sigh of relief. They rejoiced that for a certain period at least, a limit had been set to competition in giant ships, and they believed that the cloudbanks which had been gathering heavily in the Pacific had passed away.

It was a particular satisfaction to them that they had escaped with honor, as they thought, from the alliance with Japan. The alliance was a great embarrassment to England. Its continued existence would have been a serious danger to the cordial relations with the United States which are now accepted by almost all Englishmen as the indispensable basis of our world-politics. In a state of growing friction between Japan and the United States the position of Japan's ally, however carefully guarded by reservations in the actual treaty, would inevitably have given ground for suspicion and hostility. British diplomacy desired, therefore, to end the alliance with Japan, but at the same time not to be left face to face with Japan in the Pacific, where for long enough we have had no great naval force. A pact for ten years, and upheld by the three great Pacific Powers, was the way out. It seemed to bring with it the certainty of peace and economy in armaments.

Alas! a cold douche has descended upon us in England. The Government* announces, through the Admiralty, that within the next ten years it is intended to spend ten million pounds (which will probably reach a much larger figure) on a new naval base at Singapore. Why this new naval base? Why after ten years? And why at Singapore?

The Admiralty Explanation

THE Admiralty has given its explanation, and it must be remembered that the Admiralty regards every problem from the purely naval point of view. Policy is supposed to be settled by the Government, whose duty it is to ask the Admiralty what naval measures are required to carry out such and such a policy. If the Admiralty were asked to justify the creation of a great naval base at Singapore, it would answer something like this:—

> "The close of the Great War changed the naval situation at one stroke. The German fleet has disappeared and with it the necessity for the concentration of the British fleet in the North Sea. Our fleet will now revert to an earlier strategy; its post of observation and central base will be the Mediterranean—precisely that Middle Sea whose name indicates the critical importance of its strategic position in the world. But that it may move freely in any direction from the Mediterranean, it must have good bases and fuel stations. Especially must it be so equipped in the Far East and the Pacific. Until recently we have been satisfied with Hong Kong. But under the Washington agreements we cannot make Hong Kong into a great fortified base.
>
> "There remain three other possible places—Sydney, Colombo and Singapore. But Sydney and Colombo are on the fringe of the vast Pacific area. Sydney should clearly be the base for Australian and New Zealand waters, Colombo for the Indian Ocean. But if we seek a center looking both westward to India and South Africa, eastward to Japan and the Pacific coast of North America, and south to the Antipodes, then Singapore it must be. At Singapore, therefore, we must have docks and all the other appurtenances needed for a fleet of superdreadnoughts. Further, we must have this base ready in ten years, because so far as our information goes, in ten years' time the Pacific Pact may end and we shall then be dependent on the good will of Japan for the security of our interests in the Far East."

Such is the Admiralty argument. But before considering the numerous objections to the scheme, it is worth while to point out that the creation of a base at Singapore is the very core and kernel of a report which was presented at the end of 1919 by Lord Jellicoe, formerly First Sea Lord and Commander of the fleet at Jutland, to the Australian Government. This was, of course, before the Washington Conference and it is impossible to say how far, if at all, the Admiralty have since modified the original scheme. But that it involved something more imposing than the mere building of a dock or two at Singapore may be seen from a few extracts. The middle area of the Far East is subject to the Washington agreements, but just outside the circumference of the now sacred area lies Singapore, and what Lord Jellicoe proposed to do with it in 1919 was this:

> "It is not possible to consider the naval requirements of Australia without taking account also of the *naval requirements of the Pacific and Indian oceans as a whole.* The question is one of co-operation between the naval forces of the Empire stationed in Far Eastern waters. Sea communications in Indian and Chinese waters, as well as in the remainder of the Pacific, are matters of concern to the people of Australia and New Zealand; and, conversely, the safety of sea communications in the South Pacific and in China are of interest to the people of India. Similarly the safety of the bases at *Colombo and Singapore is vital* to Australia and New Zealand; and the safety of Sydney and other naval bases in the South Pacific, and of Singapore and Colombo, is of greatest importance to India. Even the prosperity of South Africa is associated, though in a lesser degree, with this question, while Canada is greatly concerned in the matter.
>
> "It will be seen, therefore, that the Far Eastern naval problem is one which concerns the Empire as a whole.
>
> "Only one conclusion can be drawn, namely: That the Far Eastern Fleet should be provided by those constituent parts of the Empire, including Great Britain, for which it is of vital necessity, and that there should be the closest co-operation, with unity of direction in war, between the various squadrons composing that fleet.
>
> "I am of opinion that the general direction of the operations of the Far Eastern Fleet should be delegated by the Admiralty to a flag officer of a high rank residing on shore at Singapore, and assisted by a strong staff. The commander-in-chief afloat and the flag officers commanding the units of the Far Eastern Fleet should all come under his command in war, although, except when placed under his command for the purposes of fleet exercises, the Dominion navies would not come under him in peace. The admiral in chief command at Singapore should visit such places in the Pacific and Indian oceans as are of importance for naval purposes in war, that he may have a very intimate knowledge of the general situation. It would also be most desirable that he should visit the dominions so that he may become familiar with the problems which confront them. He should be assisted in his duties by information furnished to him by the naval board of Australia, and the naval authorities of other dominions, should they follow Australia's example in regard to fleet units; and he should, of course, be in constant touch with the Admiralty and the officers commanding the British squadrons in China and the East Indies."

May Never Be Wanted

LORD Fisher, writing after the close of the war but before the Washington Conference, remarked that the Pacific had now become the center of British naval strategy. Jellicoe thought the same. Sydney, in his view, was to be the base for the South Seas, Colombo for the west of the area, Hong Kong for the east. These were to be subsidiary. At the center, furnishing the nexus and the control of them all, was to be Singapore. How far has Washington changed that conception in the mind of the British Admiralty? We do not know, but since they propose to proceed with a ten-million-pound scheme, their assumption presumably is that at the end of ten years we may revert to the same position as if Washington had never been. They are preparing for a world in which the Washington agreements may not have been renewed and in which the rivalries and competitive armaments in the Pacific may again have free rein. Many of us do not like this prospect at all and on many various grounds we are prepared to oppose a scheme which we think extravagant and misguided.

It is extravagant beyond words. We are spending at least ten millions on a base which may never be wanted, and ought never to be wanted, while it is the sober truth that we are quite unable to protect our country from attack by air. Public opinion is waking up rapidly to this fact. Our strength in airplanes compared with that of France is about one to five and nothing is more certain than that if a war should unfortunately come, we should be quite unable to repel the attacks which would immediately be made on London and our chief railway and industrial centers. Of course no one actually dreams of war, but the stubborn fact is there: we are lamentably weak. Mr. Amery, our First Lord of the Admiralty, declares magniloquently that it is inconsistent with our dignity to be dependent on the kindliness and good will of Japan in the Far East. But we are already, as far as our security in the air is concerned, dependent on the tolerance of France here at home, and it is, as Lord Haldane has just said, sheer "insanity" to be lavishing millions on a distant naval base (which may never be wanted) while the "heart of the Empire" is laid open to attack.

Why Not Renew Treaty?

THE reason is, of course, that owing to our naval traditions the voice of the Admiralty is still decisive when the allocation of public moneys is under discussion, whereas the Air Ministry is still a younger son and is treated with scant ceremony by his elder brethren. Undoubtedly that has to be changed, for who knows what the value of the battleship will be even in ten years' time? At present the Admiralties, including our own, are probably right in saying that the Capital ship would still play a decisive part in another war, but the airplane is only in its infancy and it is common sense that one should wait until the last possible moment before embarking on such vast expenditure. A fine figure we shall cut if we build great docks for dreadnoughts at Singapore only to find that dreadnoughts are no longer the fashion and that airplanes, submarines and mines have made it impossible for them to keep the seas. That may, indeed, not be found to be the case in ten years' time, but do the resources of the British Empire really need ten years to build a dock or two and would it not be both wise and economical to wait and see where we are in three or four or five years' time? Meanwhile we might spend a fraction of the money in making ourselves a little less helpless in the face of attack from the air.

Besides, what is our Government about that it should let the Admiralty frame an enormous program on the assumption that at the end of ten years there will be no renewal of the pact in the Pacific and that Japan and the United States and England will all be proceeding merrily on the consecrated method of producing war by getting ready for it? That is not, we imagine, the view which the United States takes of the position in the Pacific after ten years' time. Just as the likelihood of war has been banished by the American initiative for a decade, so it should be banished for another decade after that by the three powers taking action long before 1932 and announcing their intention to renew their self-denying ordinance. Armaments lead to armaments. The Admiralty says, no doubt sincerely, that it is not building "against" anyone, but that British fleets cannot move freely in the East without such a base. But at all events a battle-fleet based on a fortified central position at Singapore contemplates a state of war. That is enough. It creates, or may create, in other countries, the state of mind, the anxiety and nervousness, which leads to counter-measures.

---

*This was written before the Labor government took office. The intention and desire of the Macdonald government to do away with the Singapore naval project and substitute for it the moving to Singapore of a huge dock turned over by Germany, already have caused a storm of disapproval in the English newspaper press, and the cry has gone up, "Hands off the Navy." Without the support of the press, it is unlikely that the Labor government will be able to change the naval policy told of in Mr. Crozier's article.

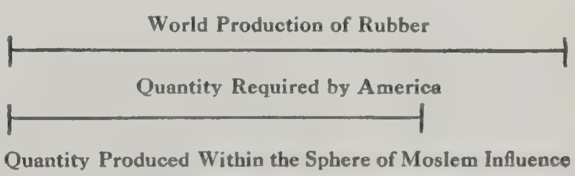
What They Tell on the Road From Mecca

Concluded from page 4

involved. It is a duty no less incumbent upon powers not so directly involved, and right in the forefront of these stands America.

It is not with the interest of America as a Christian community that the new political activities of the Mohammedan may be expected to interfere. He is mightily content at the present stage of things to see the Christian spreading abroad ideals of brotherhood and justice and liberty. There lies right in the path of his activities, however, an American commercial and industrial interest of the very first importance. There has grown up in the United States a giant which draws from abroad an essential element of existence. He is a vigorous young giant, and it has been urged of late regarding him that he is absolutely sound and fit in wind and limb, and looking to a really lusty manhood and long life. He is the automobile industry, and he walks rubber-shod. The Mohammedan has been interested in this giant, and has been examining his feet, observing with satisfaction that the giant cannot exist unshod. It has been recognized that this young giant might be made to strike a fine blow for Mohammedanism some day, *if his interest could be enlisted by a threat to his life.*

Alarming? Not at all, to the extent of causing excited and hasty conclusions; but cold fact, to which regard must be paid. This powerful young American requires no less than seventy-five per cent of the amount of rubber now produced in the world, and looks like requiring more. He is regarded as having manifested a surprising—in some foreign quarters what is described as a suicidal—lack of effective interest in the sources from which his supplies of rubber are drawn. To him, perhaps more than to any commercial creation in the world today, the new era in Mohammedanism is a manifestation which should be examined now, and from now on. There is no reason why he should lose his head in premature concern for his feet. It is by no means any fault of his that he grew up in a land which did not happen to acquire rubber-producing areas a long time ago, although it now rules in areas which, if used properly, could render him safe for the future. He has but to face the facts now, and one of these is that, from a variety of circumstances, the position with regard to the source of the supplies of rubber which he needs for his very life is as indicated on the accompanying chart. He will be interested, possibly, to learn that it is not quite an original chart, and, though accurate in the main, not just hair-splitting in meticulous correctness, being a Moslem production, in the first instance.



If it be admitted that this new Moslem movement is one to which America also should pay careful attention, the purpose of the writer will have been achieved. He is quite confident in the ability of the young auto giant of America to take care of himself when the necessity is brought home to him.

Laborites Plunge Into Secrets of British Archives

Long Denied Truths of Secret Diplomacy, Win Them Now Through Power

By a British Journalist

THE enthusiastic young men of Britain's new Labor administration have developed amazing industry in historical research, and in their activities there lies the promise of a very lively and interesting—if brief—Parliamentary session. That there will be piquant revelations is certain, although the probability is that the more highly prized "finds" brought to light in the course of the present manifestation of special interest in British history will be carefully conserved for use as ammunition in the next war at the polls.

There are many trained journalists in the ranks of the Labor representation in the House of Commons, and they are now "as hinds let loose" in promising fields. Not with the glories of ancient British days are they concerned. They know what they seek. Tell them that the Scots held off the Roman legions for 330 years and defied the English for another thousand; that the finest culture Ireland ever knew was destroyed by Danish sea rovers; that the willful destruction of a growing tree was punishable by death in Scotland at one time: those industrious young men will not dispute the statements. They will merely disregard them as of no importance. Interesting, the facts may be; but one can't club a political opponent with them in these days. The historical-research specialists of Britain's Labor government are digging only among the top layers of that history which accumulates in government archives, and they claim that they are digging solely in the interests of truth and the Labor party. Some have it that the terms are synonymous. Be that as it may, the search is for facts that will hurt when they hit.

Labor is preparing for its political opponents and their friends such a bombardment as has not been known in British politics, as the next general election will reveal. Public interest in the possibilities of the situation is keen and, where nonpartisan, sympathetic; for the feeling that the older parties never would "give each other away" too seriously has grown and gained in Britain.

To have been witness, time and again, of the wrath and chagrin of the Labor members in the House of Commons, when some suave under-secretary gravely denied them information on the ground that to give it "would not be in the public interest," is to appreciate the delight of the Labor party in now unearthing that old "Public Interest" fox which flaunted a derisive brush so often in their faces and "went to earth" in ground to them forbidden. From information at hand, it may be regarded as assured that the digging-out process is yielding material which, judiciously employed, will serve a useful public function, in the provinces of domestic and international politics, and dispose of some of "the ponderous omniscients" who have failed to justify the faith of the people.

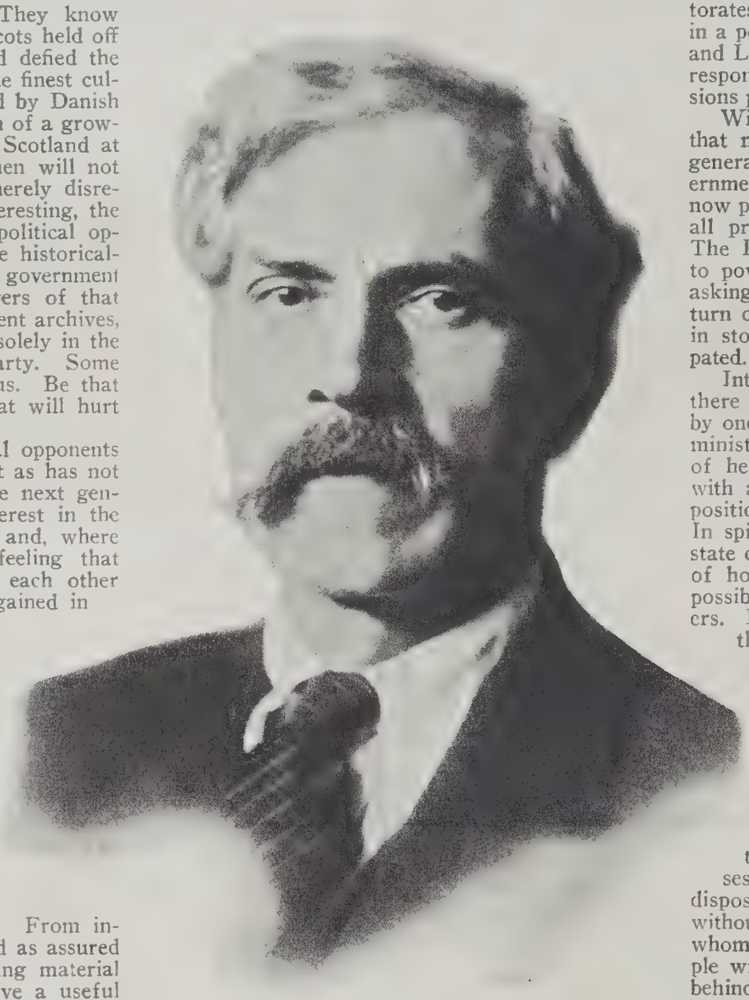
In the realm of international relationships, labor has been consistently and emphatically against secret diplomacy, and occult "understandings," and danger-breeding "combines" under secret treaties. Deliberately, systematically and thoroughly the archives of the British foreign office are now being gleaned for material in support of that Labor attitude, and results are promised. The new British Premier, in his views on the relationships of peoples, might well have been trained in America. He is an advocate of open dealing. His faith in world-opinion is equaled only by his recognition of the necessity of the world having the facts. In point of fact, the Napoleons of the Press, if not already aware of it, are likely soon to learn that *the Labor government will combat unfair presentment of news by instituting its own distribution system.*

The manner of his approach to France indicates Ramsay Macdonald's appreciation of the extent to which, administratively, he can alter old methods and speed up and simplify accepted systems, without new legislation. "My people believe they have many grounds for suspicion of yours," he says in effect to Poincaré. "Meet me and we will talk over things, for the benefit of both peoples. And the whole world can read all about it."

Open, and seemingly simple; but what are those causes of suspicion in England against France? They include the occupation of the Ruhr, the huge army of France, the 2,400 fighting airplanes always in fighting trim, the heavy armament of Channel ports, and the supplying of smaller nations on the Continent with money and arms.

Macdonald has determined, as the writer is aware, to be so mercilessly frank in this matter of France as to leave no loophole for evasion and obtain, in the interests of the peace of the world, a clear statement of French motives in the present situation. If there are no grounds for suspicion, there need be none, is his view.

Before the advent of the Labor government in Britain, THE DEARBORN INDEPENDENT indicated that in any attempt on the part of Labor to weaken or reduce the wider interests of Britain there would be discovered, by the Laborists, such opposition as must be taken account of if the party was to make headway. The cautious Scot now at the head of the party has shown that he is not playing into the hands of his opponents. The example of the capital levy, the pet idea of the crowds and the successful electioneering cry, does not stand alone. The whole matter of proposing a levy on capital has been sent already to a committee, and their task of transforming the idea from the nebulous to the tangible is of such a nature that the question of a capital levy is out of the way meantime. Another popular electioneering plank was recognition of Russia in the interests of trade and employment. Macdonald showed that in that direction he was prepared to act promptly, but not to the detriment of British interests: "Evidence has been submitted to me of activities on the part of the Soviet government directed against British interests in Asia, and the Soviet government has been asked for explanations." To stand firm in matters such as these, against the clamor of the Labor electorate, has drawn upon Macdonald the favorable attention of many outside his party, and has had a reassuring effect, on the whole.



(C) Vandyke, I. N. S.

JAMES RAMSAY MACDONALD,

The first Labor Premier of Great Britain.

There can be no denying the earnestness of the Labor administration in seeking means to effect national economy. Departmental deflation is projected. There will be an endeavor to strip off the hull of the Ship of State *all* those barnacles which accumulated there during the war years. An astonishing number have survived the period of tax-burdened poverty which Britain has passed through since 1920. It may come upon certain departments with all the force of revolution, but it is the purpose of the Labor ministers to learn just what the armies of officeholders are doing for their salaries. In this connection, the search among the government archives is stated to be rewarding most fully the labors of the seekers, and the prediction is made that in due time there will be reductions in departments, a ruthless weeding out of the protected incompetents and supernumeraries, and an improvement especially in the consular service of Britain: at all of which the British, doubtless, will not be disposed to cavil. Special attention is being paid to the methods of making appointments to the higher branches of the Colonial service. The sleuths of the Labor camp, "with a zeal never exceeded in any reformation" (to quote one of those history specialists) are nosing out particulars of trade concessions and kindred arrangements affecting areas in Protectorates and Colonial possessions, and "hope to be in a position to give some folks among the Tories and Liberals an interesting experience." The correspondence relating to appointments and concessions possesses peculiar interest for Labor.

With the steady, cautious Macdonald to see that nothing is used which will seriously affect general British interests, the material which government records, correspondence and statistics are now placing in the hands of the Labor party is in all probability likely to be used without mercy. The Labor party, in its struggle from obscurity to power, took its full share of vilification and, asking no quarter, usually made an adequate return of the same. There are uncomfortable days in store for the older parties, it may be anticipated.

Into the records of the ministry of health there is proceeding apace an investigation directed by one of the most remarkable men in the Labor ministry. Mr. John Wheatley, the new minister of health, will find himself called upon to deal with a question upon which he has attained the position of an expert—the housing of the people. In spite of the best that the older parties in the state could do, there remains in Britain a shortage of housing so deplorable that it is almost impossible to depict it adequately to American readers. In spite, further, of the huge sums spent by the state in subsidizing construction of dwellings, progress in meeting the demand has been so slow that action on the part of the Labor government is sure to be insisted upon. It has to be recorded that there are charges of "rings" holding up prices on all classes of building material. Again, heavy taxation is given as a reason for reluctance to build, so far as building speculators are concerned. For the first time such facts as are in the possession of the ministry of health will be at the disposal of a man who is capable of using them without fear. This dynamo of the North upon whom has devolved the duty of housing the people will have action, and he will have the people behind him. There seems every reason to say that, if his searches in the records of the ministry of health convince Wheatley of the operations of "rings" holding up building material, the British ministry of health will be a good "prospect" for American building material very soon thereafter.

In the grave necessity which confronts him as minister of health, in the support which he can command for proposals as to housing, and in the determination and capacity he possesses, Wheatley, who is one of the chief assets of the Labor ministry, is potentially one of its chief dangers. He hits hard. If the archives place in his hands a club, there are going to be broken heads. In his hands this matter of housing will be forced to the front, and questions of party expediency are not unlikely to be trampled underfoot. There is not in the Labor party a man of greater eloquence or grasp of affairs than the minister of health, and there are those who doubt the power of the far-seeing Macdonald to hold him in check if it comes to risking the life of his party to advance the cause which he has so closely at heart.

The activities of those Labor students of recent history are extending to every department of the administration. They will not be denied. Of the fruits of their labors the Tory and Liberal parties are likely to be made startlingly aware at the earliest opportunity. The days are gone in the British House of Commons when the Tory could deliver a "ferocious" verbal attack upon his smiling friend on the Liberal side, and then go off to dine merrily with him. You can't do that sort of thing with impunity under the watchful eyes of Labor! And now that the enemy is in possession of material never before out of more or less friendly hands, and evinces the will to use it, the British House of Commons seems faced with stirring doings. If there is any depression in the prospect, it is not in the Labor ranks. Britain herself bears up wonderfully.

Macdonald Branded 'Herr Ramsay' During War

E'en the Neighbors of His Little Home Village Turned on Him

By VICTOR MITCHELL

"I DECLINE altogether to believe that the sun is going to set on the power and prosperity of Great Britain on the evening of the day when Ramsay Macdonald takes his seat."

This was the declaration of ex-Premier Asquith in the House of Commons in supporting the vote for the Labor amendment which heralded the downfall of the Baldwin government. Nevertheless, it is only a few years since Ramsay Macdonald was stigmatized as a coward and traitor by his fellow-countrymen and had to run the gauntlet of a hostile mob in the streets of London. Now he is Prime Minister of Great Britain.

Born in the Morayshire village of Lossiemouth, of parents belonging to the agricultural laboring class, he has attained his present position through indomitable perseverance and faith in himself. It was when the great European war broke out that the labor leader stirred up a storm of popular indignation by denouncing Britain's part in the quarrel, and acting as apologist for the kaiser, under whose mahogany he had stretched his legs in happier times.

In no part of the United Kingdom were the people more scandalized than in the ancient province of Moray. The flower of its manhood had joined the colors, either to serve in the territorial regiment, the Seaforth Highlanders, or to take part in the perilous work of keeping the coast clear of the enemy's mines and submarines. Indignation meetings were held by the fisher folk and rural workers who form the bulk of the inhabitants of Lossiemouth, and there were threats of burning down the "wee hoose" which Ramsay had built a few years before as an occasional retreat from the cares of his busy life in London. The county people also took up the matter, and his expulsion from the membership of the Moray Golf Club followed. This was the unkindest cut of all, for the Moray club had the control of the fine links at Lossiemouth over which he had ranged in his childhood, and played many a good game in his mature years. It was now predicted that as a public man Ramsay Macdonald's career was at an end, and that he would soon be engulfed in an obscurity greater than that of the village hermit who lived in a lonely cave on the seashore. Even the village bairns vowed that they would refuse to caddie for him should he again venture on the links, and his unpopularity reached its peak when one of the German newspapers referred to him as "Herr Ramsay," the friend of the fatherland. But "Herr Ramsay" defied the officials of the golf club and all others concerned, and dourly pursued his game as before. He knew that in time the tide would turn.

At last the claymore was sheathed and the guns were silent. Once more the little yawls and motor boats went fishing on the firth, and Ramsay Macdonald knew that his opportunity had come. The period of recuperation and reconstruction had set in, and into the task of seeking a solution of the problems that presented themselves, he brought all the ardor of the Celt and the shrewdness of the Saxon. The storm of unpopularity that he had come through had not impaired his resourcefulness nor sapped his energy, and as a result of the general election of 1922 he headed the strongest muster of the Labor party that has ever appeared in the British House of Commons. As leader of the Opposition he soon proved his ability, curbing the extremists—the "wild men" from Glasgow—and showing good sense and moderation in dealing with domestic and international questions.

King George offered him a seat in the Privy Council, but this he declined, his democratic conscience not permitting him to tack the title of "Right Honorable" to his name. The Conservative government, then in power, first under the late Bonar Law, and later under Stanley Baldwin, found in the Lossie "loon" a worthy foeman. He kept three things before the House, namely, better international relations, the eradication of unemployment, and improved housing of the working classes. In accordance with his war-time attitude, he deprecated the "humiliation" of Germany and the too strenuous squeezing of that nation in the matter of reparations. But the government pursued its stormy course until it was wrecked on the sunken rock of Protection while in search of the unemployment remedy.

Free Trade has become an article of faith with the great majority of the British people, and in no part of the country is this faith more firmly planted than north of the River Tweed. All things being equal, it is in the very nature of the Scot to buy in the cheapest market. Some people call this thrift, others by a worse name, while others regard it as common sense. It is because the country has rejected Protection as a remedy for unemployment that the Labor party has returned to the House of Commons stronger than it has ever been in British history; and the reason why the Laborites from Glasgow are somewhat sterner and wilder than those from other parts of Scotland is because of the silent shipyards on the banks of the Clyde, and the one-roomed tenements which disgrace the northern metropolis. The people as a whole look to the new government with Ramsay Macdonald at its head to lead them out of that no-man's-land of nothing-to-do in which they have floundered since the end of the war.

From nowhere will the new premier's efforts for the regeneration of the country be more closely watched than from the hills and glens of his native Morayshire. Lossiemouth now ranks with the little town of Cricieth in Wales in having produced a prime minister, but whether the simple fisher folk who make up the bulk of its inhabitants will feel as proud of him as the Welsh people do of the little lawyer, will depend upon his ability to play a good clean round upon the political golf course without getting helplessly "bunkered." It may be said, however, that no matter how long or how short a time he may hold office, he is not the man to relinquish his game without a struggle, even though he may be "bunkered" more frequently than ever he has been on the Lossie links. There is a militant gleam in the steely gray eyes of this northern Scot, and a tenacity of purpose in the set of his jaw that may mean much; but he has yet to prove whether he is a practical statesman or merely an honest idealist. His opponents assert that his plans for the reorganization of the national exchequer and the providing of employment for more than a million and a half of men are impracticable; that they will stifle trade and drive capital out of the country. Whether this may turn out to be so or not, it is certain that Ramsay Macdonald is not the man to be easily discouraged.

The advent of a Labor government marks the beginning of a new era in British administration. The metamorphosis of the House of Commons within the last few years has been amazing to those steeped in British parliamentary traditions; but much has happened since Keir Hardie shocked his fellow-members by appearing in the House arrayed in a checked tweed suit and cloth cap to match. The age of top hats and Prince Albert coats is gone forever. The latest news from Westminster states that scarcely half-a-dozen of the "toppers," once so indispensable, can now be counted. The way seems prepared for the attack on "flunkeyism" of all descriptions which the Laborites are threatening. Scores of budding Cromwells seem ready to shout "Take away this bauble," or "that bauble"; and one member—a Londoner, by the way—recently made significant reference to King Charles having "lost his head." It is men of this description that Ramsay Macdonald numbers among his followers and it is men of this description that will wreck the Labor party before it has been long in power if he has not the strength to suppress them. He will have to "ca canny," and temper his zeal with that common sense which he has inherited from the land of his birth, for, notwithstanding all that has happened, the British people are not yet prepared to plunge very deeply into unknown political seas.

(C) Vandyke I. N. S.

This is the modest little cottage in Lossiemouth, Scotland, where Ramsay Macdonald, British political leader and Labor party leader in Parliament, was born. This quaint little fishing village is in the North of Scotland. The top photograph shows the street in which Mr. Macdonald's home is situated.

There is some talk among the Laborites of home rule for Scotland, but the party as a whole has not yet adopted the policy, although all the Scottish labor leaders favor it. Ramsay Macdonald, however, will have his hands full in looking after more pressing legislation, and although for sentimental reasons he may lend his approval to the principle of "self-determination" as applied to Scotland, he knows that it is still outside the region of practical politics, and that the Scottish people as a whole do not want anything of the kind; like the rest of the inhabitants of the United Kingdom, their principal concern at the present time is to find a remedy for post-war evils, particularly the lack of employment.

Perhaps the outstanding characteristic of Ramsay Macdonald is his intense earnestness. No one doubts his honesty of purpose, but notwithstanding his long career as a public man and the champion of the masses, he is yet untried as an administrator of the affairs of the state. If he can free his country from its heavy load of troubles, succeeding where Bonar Law and other experienced men have failed, he will be hailed as the savior of the nation, and a vindicator of the claim that the best brains of the nation do not belong to any particular class. However long or however short its term of office may be, the advent of the Labor government is bound to have a far-reaching effect on Britain's relations with the other great powers of the world.

BRIEFLY TOLD

Restoration of Germany's colonies and pre-war rights is the price demanded by the German Colonial Society for the alleged new remedy which is said to prevent sleeping sickness. A genuine remedy for sleeping sickness and tsetse fever would convert Central Africa into a prosperous country.

In Paris the number of births in 1923 was 46,400, against 48,000 in 1922.

The withdrawal of non-beverage whisky during the calendar year of 1923 was only 1,696.360 gallons as compared with 27,381,365 gallons in 1919, according to Prohibition Commissioner Haynes.

Blankets netted the Navajo Indians $150,000 for their weaving last year.

Switzerland's new president, Dr. Ernest Chuard, has been a college professor, newspaper publisher, soldier and cabinet officer, of the Helvetian Confederation.

Of the total number of employes of the Bureau of Indian Affairs practically one-half are employed in Indian schools maintained by the Government.

Ohio has more United States pensioners than any other state.

Canon Hay Aitkin, aged vicar of Norwich Cathedral, in London, has delivered 22,000 sermons. He began preaching at the age of 17 and is now 83. John Wesley preached 27,000 sermons.

Campfire girls of New York have been requested to popularize old-time American folk songs such as "Old Black Joe," "Swanee River," "Old Kentucky Home," and such old English and Scottish ballads as "Auld Lang Syne" and "Comin' Thro' the Rye." Few girls in camp last summer knew the words of these songs.

An Italian claims he has invented an apparatus whereby submarine crews can see through water 100 yards. This would reveal the presence of mines and other contrivances to destroy submarines.

Residents of Berlin find it cheaper to ride in suburban trains than to sit at home using fuel.

The proportion of students supporting themselves in the various American colleges is estimated as follows: Yale, one-third; Princeton, one-quarter; University of Chicago, one-half; University of California and the College of the City of New York, sixty per cent. The self-supporting student is eighty-five per cent of Tufts and sixty-eight per cent of the University of Washington.

"That the enormous population of foreign-born city dwellers has profoundly affected our motion picture industry, our stage, our press and our fiction is incontestable. Our fiction and our drama are in process of being Europeanized. The themes and the methods of treatment are increasingly alien to our tradition."—*Hamlin Garland, American novelist and dramatist.*

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Balsam-wool, made of the fibers of the pine and other coniferous trees, is the latest heat-retaining material.

As a result of their isolation the Hawaiian Islands have evolved six hundred and fifty species of plant life found nowhere else in the world.

More than $3,000,000,000 worth of milk is produced in a single year in the United States.

Electric power wires in Bloomsburg, Pennsylvania, were made hot enough to melt accumulations of sleet and snow.

Water to the extent of 1,500,000,000 gallons, and worth about $200,000 wholesale in New York City, was lost through the spillway of the Croton reservoir recently by an overflow.

Fulton Ferry in New York City has stopped running.

The Natal Chain is a device used in identifying new-born babies in hospitals. It is a fine gold chain with a locket bearing both parents' initials. The mother takes it to the hospital with her, and the doctor slips it on the child's neck, wrist or ankle in the mother's presence as soon as the baby is born. It cannot be unfastened, and is removed when mother and baby are taken home.

Fifteen small words comprise more than twenty-five per cent of all the words in an average book or novel, according to Professor Carl C. Brigham, of the Psychology Department of Princeton University.

Licenses of 132 doctors, products of alleged medical "diploma mills," have been revoked in Connecticut.

Nine old tattered volumes containing all deeds, contracts, wills, mortgages and similar papers in Georgia when Georgia was a British colony have been given to the department of archives and history. All efforts to get the legislature to provide an appropriation for their restoration have been in vain.

Shooting the lights out of Klamath County (Oregon) dance halls has got to cease, according to the sheriff of that county.

The French Government sells advertising space on telegraph blanks.

The new federal capital of the Australian Commonwealth is located at Canberra, about seventy miles inland midway between Sydney and Melbourne. New South Wales ceded to the federal government a tract of 900 square miles which includes the district of Canberra and a corridor connecting it with an excellent landlocked harbor.

Tsao Kun, president of China, was at one time a cloth merchant's apprentice.

Icebergs, twenty-five feet high, were in evidence in Lake Michigan, causing a serious obstacle to navigation.

A man living on Long Island, New York, has raised a family on the proceeds of sales of catnip which he cultivates and improves. The owners of pampered felines pay him well for his best grades of catnip leaf.

The ranch of A. B. Fall at Three Rivers, New Mexico, has 15,000 cattle grazing over an area fifty square miles. A hydroelectric irrigating and power plant costing approximately $200,000 is now being finished. An orchard of 100 acres and 400 acres of alfalfa stretch almost as far as the eye can see. It is said the ranch includes 40,000 acres of school sections, 30,000 acres of land on the Mescalero Indian Reservation and 35,000 acres of the Forest Reserve which has been leased. The value is placed at about $500,000.

Approximately eighty per cent of the corn crop in the United States is sold on "the hoof" in the form of hogs.

Three hundred acres in the Shasta National Forest, of California, have been given to the Federal Government. The government plans to make the tract attractive to campers. Castle Lake, included in the gift, adds greatly to its recreational value.

Courses in real estate are part of the curriculum of Columbia, Boston, and California universities.

Miss Anna W. Williams, whose profile adorned the Bland silver dollar coined forty-six years ago, has retired after forty years of service in the Philadelphia schools. Miss Williams achieved a success in kindergarten work that was recognized beyond the city in which she taught.

Looking for a Job in Los Angeles

Are Ball Players Worth the Price?

CHRONICLER OF THE NEGLECTED TRUTH

A Business Girl Looks for a Job in Los Angeles

And Finds There Are More Applicants Than Positions in Sunny California

Are You Thinking of Going to California? Read This:

Los Angeles is crammed with work seekers, due
to the tourist class that daily brings thousands.
Jobs are not waiting—they are snapped up quickly.
Get your job first, then go West.
Go prepared to start at the bottom.
Take plenty of money—for at least three months.
The climate is wonderful—but not edible.
"Sell California all you want," says the Advertising
Club, "but sell it as it is."

"Overdone, overdone," wails the Salvation Army,
whose burden is doubled by the tourist influx.
Don't go to Los Angeles unless you are proof against
loneliness and big city temptations.
Don't go if you are a girl under twenty. Don't
go if you are untrained.
"Leave your criticisms behind and bring a supply of
patience, perseverance and pluck," says the
Y. W. C. A.

By MARY E. WALTER

CONSTANT "don'ts" are broadcast from Los Angeles to the movie-mad who would migrate thither, but how about the vast multitude in other lines of work—especially the business girl—who yearn toward the land of sunshine and gold-paved streets?

An efficient woman stenographer with five years' experience in a railroad company of an eastern metropolis wished to quit the snow and seek the fruits and flowers of Southern California. So she wrote an employment agency in Los Angeles for a position.

The answer she got, on the testimony of employment agents and others in Los Angeles, from whom come the following facts and figures, sums up the employment situation there for business girls and about every one else, with shining exceptions. It says:

"There are altogether too many high-grade stenographers and secretaries in Los Angeles out of work to permit us to encourage your coming here in search of employment—this because of the overplus of girls who have flocked to this city and who continue to arrive on every train and steamer. Unless you have friends—unless you have a position already lined up—unless you possess extraordinary ability, do not expect readily to find employment in your line in California, especially in the vicinity of Los Angeles."

A Ticket Home? Use It

AFTER interviewing numerous employment bureaus one visualizes Los Angeles as a golden magnet attracting from all America steady streams of people—on trains, in autos, on foot, planning to settle in the West and find work, or stay for a season—and find work. Due proportion of these are girls hoping for business positions.

Many of these step off the train and go straight to an employment agency confident of work waiting for them.

Lately such an "easterner"—as the "westerners" say—faced a sympathetic woman managing a free employment bureau in Los Angeles who counts her average of weekly applicants 400 to 500, with probably thirty girls to every employer's call. The girl said hungrily:

"I must have work or starve!" In all particulars she failed pathetically of the requirements of employers described below.

"Have you a ticket home?" asked the woman. The girl had.

"Use it. Go back to your home town job and stay. Why did you come here?"

"Climate! Sunshine!"

"But at meal time you need a real ham sandwich!"

Because she listens to such tales of woe daily, because she hasn't positions to go round, because she lets 'em weep on her shoulder, this manager, like others, goes home at night, "like a rag."

"And yet they come!" she sighs.

They come, it seems, "having heard of fortunes made in western oil and real estate"; for "cheaper living" and "better money" in salary and investments.

Drawn by the "Movies"

"MANY girls seem to be told in the East that they can get positions easily"—foolish little things who fancy the advertisements about the possibilities of California apply to them. "Others lack common sense," suggests a woman to whom many apply daily. "They think things here are different—jobs for all served on a silver platter; and—the tragedy of it—they fancy everyone here wants them to come. And when they arrive, out of their own environment, they are pitifully dazed."

Many girls are drawn by the suppressed yearning toward "movies," seeking temporary employment till they are placed as stars or near-stars; others seek secretaryships among the dozen or so stars that have secretaries; or dream of the neatly written scenarios tucked in their trunks—blighted buds that never blossom.

Some come for the fruit—work mostly out of town, where "fruit tramps" follow the seasons through orchards, canneries and packing houses.

The eternal climate draws thousands—like the girl from New Jersey who sold her furs and flannels and migrated West. She got no work, but November, on coast points, found her chilled to the bone—another example of the ignorance of the East for the West.

Applicants outnumber positions, declare agents, in varying percentages from thirty to one in the free typewriter bureau; two to one in a specialized bureau. A woman's vocational alliance places one out of five applicants, a low percentage, the manager avows, but fills eighty per cent of orders, which is high. Miss May E. Gray, commercial employment secretary of the Y. W. C. A., shows that 3,000 girls and women registered with her last year and she placed five hundred for seven hundred positions open. That statement tells the whole story.

The information desk of the Chamber of Commerce—which has no placement bureau—gets from five to twenty-five applications for work a day. A typewriter concern maintaining a free bureau placed four hundred forty-nine last autumn against some 1,000 applicants, and called it a dull season.

Of all these seekers the "eastern" and Canadian percentage is given variously from fifty to ninety-five per cent. Miss Gray made a special count for January and found forty-five per cent had been in town less than three months.

"And twenty per cent of the easterners come broke!" is the general verdict.

The 1920 national census gives, as the number of women employed in Los Angeles in the various occupations, 68,402. Contrast these figures with the immigration westward over all routes. Three hundred sixty-seven thousand persons came to Los Angeles in 1922 by rail; 90,000 by auto; in 1923 came 796,250 by rail and 450,000 by auto. Others arrived by water over the sixty-seven lines that touch at the harbor. Of these the stable increase, based on building statistics, is 200,000 for the year, bringing the population to a million last Thanksgiving, with steady increase since.

Those are figures for adventurous little girls and their parents to ponder.

Another stumblingblock in the way of the migrant work-seeking girl—local employers prefer local references, due partly to the shifting nature of the incoming tide, sight-seers, excursionists, who arrive with round-trip tickets in their pockets, declaring themselves "permanent." Employers are wary of "transients" who waste time and money. Again some employers are easterners and want office help familiar with local conditions and Spanish names.

Many Jobless in City

THE immigrant girl, confident she is a good "steno maid," facing unemployment and her last nickel, naturally becomes resentful toward employers and town, while the remissness is her own, as she will guess if she reads to the end of the chapter.

There are many jobless girls in Los Angeles, because from the oversupply employers can pick as they choose. Hence come repeated calls for legal stenographers at twenty dollars, "because nobody has to pay thirty dollars." So, likewise, business offices demand "well dressed girls with pleasing personality," with "marcels and smart attire." One lawyer asked for a stenographer who "went well with mahogany furniture." Another rejected a brilliant applicant who "had a little grease spot" on her otherwise immaculate costume. This definition of type is confirmed by many bureaus.

The age limit, set by Los Angeles, as elsewhere, brings heartache to older women who go West.

"Efficient older women come to me in tears, hungry, penniless," said a woman agent—but they are cursed with the "over thirty" look, which to many an employer means "hopeless."

According to all witnesses, girls and women in Los Angeles offices and department stores are better class than in many other cities—and better looking. The reason: oversupply. Employers can choose the best. Many accept lower positions than they held elsewhere—teachers, secretaries, buyers, nurses, clerking in stores or serving as waitresses, biding advancement to their own lines. Others have come with their savings to settle and are satisfied with less. Thus is lowered the scale of wages for professional and higher educated and there is competition, too great for the comfort of the newcomer.

Yet, "the men who have made Los Angeles want people to come," said an official of the Merchants and Manufacturers Association, "and I am amazed at the absorbing power of the city as to employment of the incoming horde." This is due to the rapid growth.

What newcomers are wanted and under what conditions is announced daily in form and personal letters broadcast by employment agencies, the Y. W. C. A. and city institutions, to inquirers throughout the United States and Canada and the rest of the world, who exhibit little understanding of western conditions as to employment and salary.

One placement manager who deals only with high grades attributes the oversupply to influx of the mediocre and incompetent, saying there is plenty of room at the top for exceptional people. He had a list of 32 positions in his office for two weeks, unfilled, all with salaries from $2,400 to $15,000. He sent East to fill some of these, he said.

"The efficient girl can get work anywhere," say such as he, yet who admits herself inefficient? Employment bureaus proclaim her less likely to fall into unemployed mediocrity if she has taken the precaution to come West with (1) money on hand, (2) a return ticket in her purse, (3) patience to wait, (4) a string on the home town job she left behind.

Don't, above all things, go West without money! is the warning of all. Too many arrive with funds for a week, "to be taken care of by the city and so make taxes higher."

Y. W. C. A. Bears the Brunt

ONE fond mama wrote the "Y." She was sending her daughter from Canada, "with just enough money to get there and you will have to take care of her when she comes." Another girl from somewhere wrote an agent to advance her fare West. A third said "just telegraph and I'll come." Hundreds of girls a month apply to the "Y" for aid.

Money for three or four months or for "an indefinite" period is vital—no one pinched for cash can look confidently for work.

Los Angeles invites the best. What has she to offer them?

"Housing for the influx of girls into Los Angeles is entirely inadequate," said Miss Charlotte Davis, general secretary of the Y. W. C. A., referring to institutional housing. Homes and hotels maintained by such institutions "are not a drop in the bucket to fill the housing needs," said she. "We all feel tremendous responsibility in the matter and earnestly desire expansion, but we never can house all this remarkable migration westward." As long ago as year before last 18,000 girls applied to the Clark Memorial Home, who could not be taken in. This is said to be the loveliest home of its kind in the world, the last word in comfort and beauty but it houses only 200. For the past three years, an average of 5,000 girls a year applied at the "Y" room registry alone, and it reports 11,896 housed last year. The cheaper living quarters in rented rooms and apartments are far from the business center and street cars exhibit the rush-hour tragedy.

Among other things, Los Angeles offers the newcomer industrial expansion which is increasing demand for office help. But most manufacturing is suburban, eighteen to twenty-five miles from the city.

Hard-luck Stories Plentiful

HARD-luck stories are plentiful of eastern girls with too much hope and too little money, even trained professionals—girls, widows and old maids, "but the widows are more helpless than the old maids," it is said.

"I have been in town an hour and I'll land a job before night," is the boast of Flossie Smith, grocery clerk from Corn Center, or of Mary Jones, whose fond folks believe her the wonder of the age. But verily, Los Angeles is a million-people metropolis, "different" and "unique" to the small-town girl.

"You have to have sympathy with 'em," said a man agent who showed a supply of face towels for those that came to work and remained to weep.

Then there is the awful loneliness of the big city which is no longer the homey town outlanders are liable to think it. A million from all parts of the globe do not make for sociability. Los Angeles is unwestern in this respect, far from its free-and-easy early days.

"It is a pity," said a "Y" secretary, "that girls come thinking it is the ideal friendly place, when friends are hard to make and unsafe to pick up. Many a girl confides to me she is tired of going to the movies alone on $16 a week—'Where and how can I meet nice people?'"

Here, in a word, is the gist of this yarn: Los Angeles welcomes workers, but a job is not hatched for the aspirant as soon as she steps off the train; the more efficient she is the sooner she may be placed, but she should write in advance.

Most of all, money, money, money for three months and a return ticket are the best antidotes for disappointment in this glorious playground of all the world.

Humbug of Gland Therapy Revealed as Peril

Likely to Bring Death Sooner, Has No Beneficial Results, Say Practitioners

By ROBERT MORGAN

This is the second of two stories by Mr. Morgan.

IT IS the object of all reputable physicians and surgeons, and the main reason for the existence of their associations, to learn and apply the best and most effective remedy to every disease which humanity presents to them for cure. Contemporaneous with this is the other object of preventing the application to sick men and women of nostrums which either are of no effect in combating disease, or, while affording temporary relief, finally put the sufferer in a worse condition than he would have been had he taken no treatment for his illness.

It is particularly the object of associations of reputable physicians and surgeons to bar from their ranks those who devise, disseminate and apply such nostrums.

The exposure of every medical fraud since this Union was founded has been due to the efforts of the reputable physicians of this country, either working individually or as associations, or sitting on boards of examination in the various states. Likewise, it is a matter of similar record that every *real* discovery, every *actual* advancement in the field of medicine or surgery has been seized upon with the greatest eagerness, and applied with the utmost honesty, to the immediate assistance of the sick. There has been nothing supernatural, nothing miraculous, nothing uncanny about this selection of the true from the false, the genuine from the fake, the valuable from the worthless. It has been accomplished by long years of experimentation, study, thought, application, and the expenditure of large sums of money.

The first pound of insulin ever produced cost more than one million dollars and ten years of constant effort; the first ounce of adrenalin ever obtained cost nearly half of this sum and an equal period of study and experiment. What is today a simple operation for the stay of advancing senility, known to the medical profession as prostatectomy, was more than a decade in being brought to its present perfection. The knowledge that the X-ray can be applied beneficially to cancer was more than five years in accumulation, and it is only within the past year that accurate scales of dosage and meters therefor have been brought to perfection.

It is necessary to state these conditions flatly because, without exception, the reputable, well-trained physicians, the managing boards of the nation's best hospitals, the leading medical research laboratories, the state, county and city medical organizations, and those boards which have charge of our laws regulating the practice of medicine, are declaring with one voice that the present-day practice of gland-surgery, gland transplantation, gland injection, and gland-pill dosage is utterly without merit, worthless as a preventive of disease, valueless in the prolongation of life, useless as a restorer of mental or sexual vigor, and actually damaging to the person submitting to it.

So clearly has this charge been proved that the medical examining boards of several states are refusing licenses to men who practice gland therapy, and taking up the licenses of those physicians who have turned to this field. In justice to the reputable physicians and surgeons of this country, it should be said here that the number of those who have gone into the practice of gland therapy are few and far between, and none of the first rank of the medical profession.

Against this organized effort to save the people from the latest medical deception, the gland therapists are raising the usual cry of persecution. In the face of the hundreds of authenticated cases in which men and women who have undergone gland "operations" have applied to the hospitals of the country for such treatment as can be given to save them from the results of their folly, and in spite of the scores whose deaths have been directly traceable to the effort to reverse the tide of life, these intermediaries between goat and man set up the claim that, because they have discovered a new science, the "regulars" are jealous! Yet these same "regulars" were not jealous when the established laboratories of this and other countries announced the discoveries of serums, antitoxins, vaccines, and extracts which, through their very use by these "regulars," have become our main weapons against disease.

These conditions being as they are, it is reasonable to believe that the opposition of the organized physicians and surgeons of the country to the doctrines of the gland therapists is well founded, and that it behooves the public at the very least to consider seriously the statements of the reputable physicians before placing their lives, and their future conditions of life, in the hands of men who claim to have made, overnight, so to speak, revolutionary discoveries for which the scientists of generations have been seeking in vain.

This opposition is based on the three claims of the gland therapists, as discussed in the previous paper of this series:

First, that all diseases can be cured by treatment of the interstitial glands.

To this, the organized medical men of America reply:

The statement that all diseases can be cured is false. No reputable physician or surgeon can or will say that he is able to *cure* any disease, either in general, or in the particular instance of the individual patient. Certain remedies assist nature in the removal of the causes which bring about disease. These remedies, before they are accepted, are tried in hundreds, perhaps thousands of cases. Before they are applied to human beings, they are tried on animals, their effect noted on tissue, on circulation, on nervous systems, and so on. In some instances that medication which is effective for one patient will have no effect on another, while a different treatment will work a cure on the second patient. To announce a cure-all is equivalent to broadcasting the discovery of another Fountain of Youth. The known laws of anatomy, physiology, and even of life itself, disprove this claim every time it is presented.

Gland "operators" and medical "diploma mill" graduates sometimes are caught in strange places. Here is Miss Marguerite Zoff, naturalization examiner at San Francisco, who recently caught two fake doctors, when one of them applied for naturalization, and was vouched for as good material for citizenship by the other. The one asking citizenship had neither diploma nor license to practice, yet was practising, while his sponsor had a license which he had obtained by fraud. Miss Zoff turned both over to the California State Board of Medical Examiners, which took action against them. Citizenship was denied to the applicant.

Second, that full mental, physical and life-reproducing powers are restored to men and women of any age by gland operations, gland injections or internal doses of gland extracts.

Man cannot evade the cycle of the years, say the physicians and surgeons, the hospital authorities and the research experts of this country. Man's seasons are four—the spring of his youth, the summer of his manhood, the autumn of his middle age, and the winter of his decline and disintegration into the elements from which his body came. There possibly is something secreted by the ductless glands of reproduction that has an influence on the volume of animal vigor in man's early years, though no investigator, equipped with the best of instruments and backed by abundant funds, has been able to find it. Theoretically this substance, *if it ever is found,* might be so introduced into the human body as to prolong the virile powers, but so far nothing has been discovered which will do more than temporarily—and very temporarily, at that—stimulate the reproductive organs. Furthermore, such stimulation invariably leaves the man or woman to whom it is given in a weakened condition, with these organs permanently reduced in power by the treatment.

Third, that life may be prolonged indefinitely by the repetition of the gland operation at definitely stated periods.

To this, the responsible physicians say:

The gravest danger to human life in the use of glands and gland products in this latest cult of therapy lies in the breaking down of the co-relation of all the glands in the body. When one gland is interfered with, all the chain of glands is disturbed. If one is benefited, the others are unbalanced; the reaction is like that of stimulation to the heart among muscles and thinking physicians are very careful about applying stimulation to it, as well as to the infinitely more delicate and much less-known glands. As man grows older, as does everything else in life, he grows older all over his body, proportionately, until death intervenes to end the aging process. The arteries normally harden with age, since they are called on to furnish less blood to the brain, the kidneys, the stomach and other organs. This is conservation of energy, so that the aging body may the longer resist the encroachment of the years. If, then, we inject suddenly into a man of seventy the physical desires of a youth of twenty—granting for the sake of argument that this can be done—we throw a swift and tremendous force into his hardening arteries, without preparing them in any manner for this unexpected and unusual strain. The arteries cannot endure this stimulation; they give way, and the man dies, either immediately after the operation, or within a short period of time. Life has its physical limits, and man has not yet overcome them, nor can he overcome them by the rebuilding of one organ—be it gland or muscle—without reference or regard to the other well coordinated glands and muscles in the same body.

Referring again to the restoration of the procreative powers of men and women, the physicians bring forth the well-known fact, ignored by the gland therapists, that every man and every woman has the power to reproduce himself or herself just so many times and no more. This is a matter which cannot be discussed here, but it is so well established that a properly performed autopsy on a man or woman will reveal to the skilled surgeon or physician the exact age of the individual so operated upon. It is impossible by the aid of a goat, a magic wand, a philosopher's stone, or any other variety of the myriad forms of hokum found since the world began to increase this number of procreative possibilities by even one. Their number is as fixed and definite for each individual as is the number of bones in a human finger.

When that fixed and immutable number of procreative possibilities has been used up, atrophied, or otherwise removed from the reproductive organs, there is no human agency by which it can be replaced. This is a plain statement of confirmed fact. It permanently refutes the main claim of the gland therapists, by which ninety-nine per cent of their "business" is lured to them, that the desires and the capabilities of youth can be restored to the man and woman who have passed their reproductive prime. The further claim of restoration of mental activity and physical agility is merely decorative camouflage thrown around the real purpose of men and women in visiting these gland operators.

There are certain other and possibly less important objections to the work of the gland therapists, largely growing out of the records of their victims in hospitals throughout this country.

The fact that these gland therapists have taken the place, almost universally, of the quacks known years ago as "men's specialists," is held to be an accurate index of the position of these newest vendors of a cure for all diseases in the field of medicine and surgery.

The goat-gland serums made from glands supplied by slaughterhouses from New York to San Francisco and from Minneapolis to New Orleans, is, for the most part, dirty and infectious. The writer has had the privilege of examining not less than twenty bottles of this serum, manufactured by as many mushroom "laboratories" scattered throughout this country. Not one of these bottles was free from foreign substances, in some cases dirt and hair and other materials.

The writer has personal knowledge of four instances, in one western city, three women and one man, all of whom are today in hospitals suffering from very severe poisoning as a result of taking the gland serum injections administered by one goat-gland practitioner. And he is supposed to be one of the few well-trained physicians who have entered this field. How great then is the danger from the untrained operator?

The *Journal of the American Medical Association,* in its issue for August 11, 1923, comments editorially on the gland humbug, as follows:

"There is, however, in support of this rejuvenation method, only a mass of poorly supported, uncontrolled clinical evidence, and some laboratory evidence not bearing directly on the point concerned. Certainly, *there is not as yet any actual proof that rejuvenation has been accomplished in a single individual, or any basis for the belief that it ever will be accomplished.*"

This expresses, in brief, the opinion of the reputable physicians and surgeons in every community of the United States. It represents the majority of expert medical opinion in a nation which has advanced further in remedial medicine and surgery than any other nation in the world. It summarizes the best and latest thought of the most highly trained minds of the world on the fabled Elixir of Life, which began, so far as we know, more than four thousand years ago, in a chanted "incantation for transforming an old man into a youth of twenty."

It would be well for the unfortunate "goats"—both human and Toggenburg—caught in this wave of false hopes to buy themselves a brace of amulets and a round-trip ticket to Bimini, for there and there alone flows the Fountain of Youth, and the interest of a search for that fabled land might keep life in their old bodies some years more than would the work of our copyists of a pair of Jewish "specialists" in Europe.

Is Public School To Be Engulfed by Politics?

Legislation Providing for Department of Education Denounced as Logrolling

By AARON HARDY ULM

FROM the beginning, the schools of the country have been local institutions, and as a rule they have been jealously guarded as such. Even state government control and support, while predominant in some places, has been, as a rule, secondary to local control and support.

Today, 73.4 per cent of all the funds spent on the public schools is raised locally, that is, in the school districts, towns or cities where the schools operate. Only 11.6 per cent is raised even by county taxation, and only fifteen per cent is supplied from state treasuries. Control of the schools is equally in the hands of the local communities.

While the rule does not hold uniformly, it is worthy of note that there is evidently a distinct relation between local support and school efficiency. In most of the states whose schools are rated as of high efficiency, local support predominates; in many of those where the efficiency rating is low, the schools are supported in the main by the states or by the states and counties. This may be only a coincidence but the facts indicate that when the financing and the management of schools are closest to those who patronize them greatest educational progress is made.

The Federal government has never exercised any control over or given any real support to the public schools. For many years the United States Bureau of Education has been in existence, but, regarding the schools in the states, its duties have been only to collect and distribute information having to do with educational matters in general.

What Bill Would Do

THE only item of apparent support ever given the common schools by the Federal government was in setting aside at first one and later two land lots in each township of certain western states for school purposes. This, however, merely conserved to the states for school support what was already theirs.

Until recent years it was held generally that Federal support would carry with it Federal control, which nobody would tolerate.

Now, however, Federal support or aid for the common schools is being demanded by very powerful groups.

For five years a bill which would provide it has pended in Congress. This bill very probably will come up for action in the present Congress, perhaps during the present session.

It first was known as the Smith-Towner bill, then as the Sterling-Towner bill, and is now known as the Sterling-Reed bill, the names being those of the members of the Senate and House who have "fathered" it.

This measure aims at setting up a Federal Department of Education, headed by a Cabinet member, and at throwing open the doors of the United States Treasury for the support of the common schools of the country.

The issue thus brought to point is perhaps the most important one now before the country. For it has to do vitally with the minds of the country's future citizenry, with the shaping of the country's thought in manifold directions, with, possibly, putting great and subtle power in the hands of bureau officials in Washington far removed from the schools.

The proposed Department of Education would have a Cabinet member at its head and would be provided with at least $100,000,000 for expenditure on the schools of the states. The bill disavows Federal control of the public schools but *yet would establish conditions which the states and local communities would have to meet to share in Federal funds.*

Arguments for Measure

THE proposed department is argued for on the ground that education is as important as other things, like agriculture, labor and commerce, which have been given departmental standing in the national government, and representation in the President's Cabinet. It is objected to on the ground, among others, that, unless it be given authority to supervise education—which no one seems to favor—the department could do nothing which cannot be done as well or better by the present Bureau of Education. If it were given power to supervise the schools it would mean the passing of control of all the schools to the Federal government, with the threat of bureaucracy and misuse of the almost unlimited power that would thus be put in the hands of a few officials whose selection would be governed largely by the exigencies of national politics. The head of the proposed department, for example, being in the cabinet, would be chosen necessarily first as a party man rather than as an educator.

Without power to exercise or funds to distribute, it seems evident that a Department of Education could achieve nothing beyond what now is done except perhaps to add a little "dignity" to teaching.

The fear of those who oppose the creation of the department is that it will exercise power, through the large funds distributed if not by direct warrant.

Therefore, the real core of the issue as it now stands lies in the proposed appropriation of Federal funds for the support or aid of the public schools of the country.

This appropriation will be made on the "fifty-fifty" principle; that is, communities sharing it must provide at least equal sums for the purposes in view.

There are several of these purposes.

The sum of $7,500,000 of the annual appropriation is proposed for the eradication of illiteracy among the native-born population. It would be distributed in ratio to illiteracy among the native of the different states. Thus the Southern states, wherein, largely on account of the Negroes, the rate of illiteracy is high, would get larger portions of this than would the states in other sections.

Another $7,500,000 would be for war on illiteracy among the foreign-born, and would be so distributed; thus assuring those states with large immigrant populations the big shares of this.

The sum of $20,000,000 is for physical education and instruction in the principles of health and sanitation. It is to be distributed on the basis of population.

The balance, $50,000,000, would go to the states "to be used in public elementary and secondary schools for the partial payment of teachers' salaries, for providing better instruction and extended school terms, especially in rural schools in partially settled localities, for the extension and adaptation of public libraries for educational purposes, and otherwise providing equally good educational opportunities for the children of the several states." One-half this sum, or $25,000,000, is to be distributed on the basis of the number of children of school age in the different states. The other half is to be divided on the basis of the number of teachers employed in the different states.

Thus on some apportionment the states of almost every section of the country will seem to profit at the expense of other sections.

In fact, therein lies the prime argument for the venture. It is argued by those who favor it that rich New England should help educate the "poor" South, and that education in poor rural districts of the West is an obligation on the wealthy cities of the East.

A committee of business men which studied the subject during the last session of Congress declared in an extended report "that the framers of the bill have been guided by political considerations rather than educational necessities."

"It is a logrolling bill," this committee held. "More than $40,000,000 of the $100,000,000 appropriation would be apportioned to the following eight states: New York, Pennsylvania, Illinois, Ohio, Massachusetts, Michigan, Iowa and Texas. These states cannot be classed as states with backward educational institutions; they pay their teachers above the average for the country. There is neither an educational nor a poverty argument for Federal aid for these states."

Eighty Cents for a Child

PROFESSOR Rufus S. Tucker, of the Department of Economics of Harvard University, says that the appropriation would provide only eighty cents for each child of school age in the country and only $38.40 for each teacher. Therefore, at the highest estimate, the allotments which will reach those communities whose schools may need help will not be enough to bring about great improvement, or anything like equal schooling opportunities for all the children of the country, which is the venture's ostensible aim.

And what price will be paid for this "help" from the Federal Treasury? Advocates of the measure say none. They claim that it will be a subsidy without strings.

The bill itself provides: "That all the educational facilities encouraged by the provisions of this act and accepted by the state shall be organized, supervised and administered exclusively by the legally constituted state and local educational authorities of said state, and the Secretary of Education shall exercise no authority in relation thereto; and this act shall not be construed to imply Federal control of education within the states, nor to impair the freedom of the states in the conduct and management of their respective school systems."

Yet, as stated before, the bill itself makes stipulations which would amount to *requirements that the states accepting the aid surrender at least some power over the schools* thus benefiting. These requirements may be beneficent but they establish a basis of at least partial supervision from Washington. The conditions are that school terms of at least twenty-four weeks a year be provided, that compulsory education laws be in effect, and that annual reports be made to Washington on the expenditure of all funds coming within the Federal Aid Act.

If these strings can be tied to the appropriations thus made to the states, there is no reason why any others which any subsequent Congress may desire to attach cannot be put on them, even to the bringing of the public schools completely under the jurisdiction of Washington bureaucracy.

Ultimately, no doubt, other conditions would be applied. For if the aid is needed it is just as essential that the aid be economically and intelligently administered. And the country as a whole is not likely to be willing to supply funds to be wasted by indifferent school administrators anywhere. And efficient administration throughout the country can be assured only through placing large power in the hands of Federal officials in Washington. The power to see to efficient administration will carry with it the power to direct the activities of virtually every school using Federal funds, even to saying *what books shall be used, what kind of economics or history shall be taught—even to making it possible for the schools to be used on a national scale for serving the purposes of a political party or of any group of invidious interests which might happen to get control of the Federal government.*

"A centralized bureau having supervision of the education of the country would always be subject to political interests and ultimately to political control," says President Hibben, of Princeton University.

While the organized teachers of the country, as expressed in the National Education Association, are strong for the measure, many of the most outstanding educators of the country are, like President Hibben, much opposed to it. These include men like G. Stanley Hall, President of Clark University; Nicholas Murray Butler, of Columbia; President Hadley, of Yale; Alexander Inglis, Professor of Education at Harvard. These and many others of similar standing have denounced the proposal as one of the most dangerous that can be made.

"The strength of American education," says Dr. Samuel P. Capen, Chancellor of Buffalo University, "lies chiefly in its diversity, its flexibility and its freedom. The diversity and flexibility that have characterized American education are dependent upon local initiative and local responsibility. A national system, centralized from Washington, would destroy both."

Says President Butler, of Columbia University: "There is not enough money in the United States, even if every dollar of it were expended on education, to provide by Federal authority or through what is naïvely called co-operation between the Federal government and the separate states educational results that would be at all comparable with those that have already been reached under the free and natural system that has grown up among us."

Illiteracy Sharply Cut

WHILE there still is illiteracy in the nation, the educational status of the people has improved and still is improving rapidly under the local school system now prevailing.

Between 1890 and 1920 the illiteracy rate for the country as a whole was reduced from 13.3 per cent to six per cent. This in despite of the fact that during that time there came in from Europe about *three and a half million illiterate immigrants,* and the high rate of illiteracy among the Negroes of the South.

In 1871 only $63,000,000 was spent on public schools in all the country; in 1920 the sum spent amounted to $1,103,000,000. This was an increase of more than sixteen times, while during the same period population increased only about four times.

Our illiteracy rating still is below that of some European countries, notably France and Germany, where the schools are operated as national institutions, control being centralized in those country's capitals.

But it is now realized that, while their schools are more efficient mechanically than they would be under local control, centralized direction of education has worked immense and insidious harm in both France and Germany. The power over those countries' minds which the centralized systems gave to a few in high authority very probably accounted for much of the national "psychology" which brought on the war and which still complicates the peace.

One eminent critic of the proposed step toward a national educational system has gone so far in discussing it as to say: "In the United States we are, in flat defiance of all our professed principles and ideals, building a system of bureaucracies that will put to shame the best efforts of the government of the czar of all the Russias when in the heyday of its glory."

And many say that so-called "national aid" to education would be the longest step ever made in that baneful direction.

The big point at issue is that of control.

Does It Mean Prussianizing?

WILL the Federal government be willing to provide large sums of money and yet leave all control of the common schools to the states and local communities as is now the case? Or will the adoption of the measure be a beginning of Federalization—or Prussianization, as some who oppose it call the venture—of what, next to the home, is the most important adjunct of the nation's life, the school?

It is argued that other "fifty-fifty" ventures of like kind, such as the county agent system and Federal aid to good roads, have not resulted in Federal bureaucratic usurpation of state and local authority. But rather definite strings are tied to those other appropriations, and in case of some of their objects there is steady tendency toward increase of direction from Washington. Only lately it has been seriously proposed in Congress, for example, that certain matters having to do with the licensing of automobiles be brought within Federal jurisdiction by establishing them as conditions to the receipt of funds for road building.

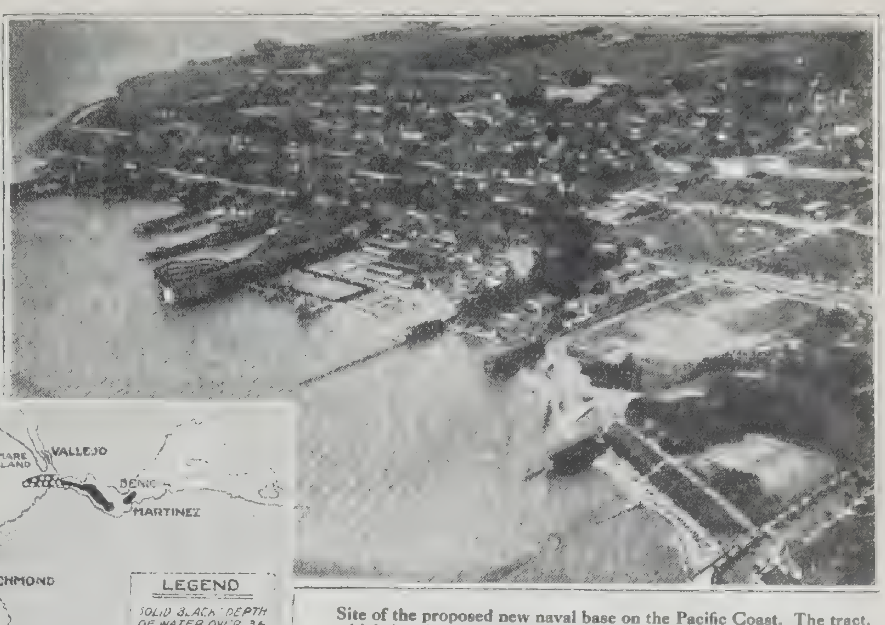
But agricultural extension and roads are quite different in many respects from schools. The schools are the institutions whence come the intellectual independence of the country. Schools foreshadow the nation.

It is not the government's business to tell the people what to think, nor to marshal the people's thoughts this way or that.

It is the government's business to be guided by what the people are thinking.

$50,000,000 for a New Home for Battleships

Alameda Will Give $40,000,000 Site If Navy Establishes Operating Base for Fleet in 'Frisco Bay



Site of the proposed new naval base on the Pacific Coast. The tract, which has been given to the government by the city of Alameda, is shown at the upper left of this airplane photograph. The city shown is Alameda, and the water, San Francisco Bay.

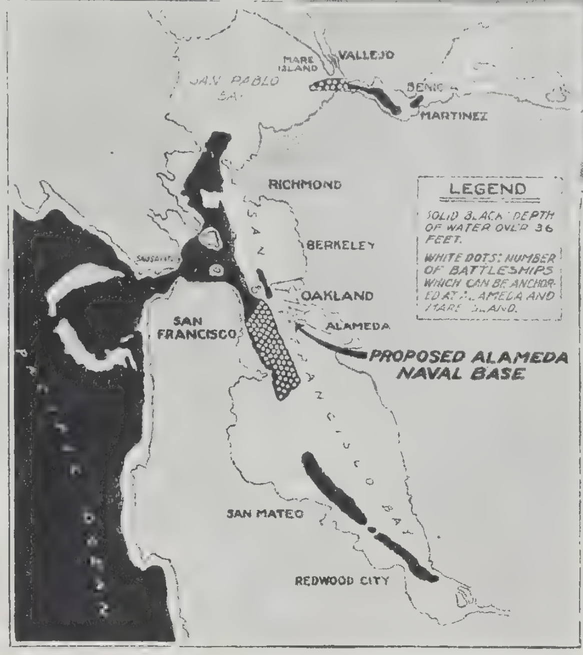
By HARRY H. DUNN

A NEW naval base for the battleship fleet of the United States on the Pacific Ocean, comparable with the similar base at Hampton Roads, is the plan of the Navy Department as presented to Congress in the Naval Omnibus Bill. The project has the approval of the Budget Director, the support of the reports of several committees of naval experts who have investigated the matter officially, and, of course, the backing of the Secretary and the entire Navy Department. According to this plan, the newest and most modern of our naval bases will occupy 5,340 acres of land at the western edge of Alameda, a small city located on an island along the eastern and mainland shore of San Francisco Bay. This island is opposite, but a trifle south of, the Golden Gate entrance to that bay, and is approximately five miles from deep water in the Pacific Ocean, though it borders on deep water in the bay.

The site for the naval operating base has been given to the national government by the city of Alameda, the only condition being that the government accept the gift before January 1, 1925. The deed to the property is now in the hands of the Secretary of the Navy, and the property is conservatively valued at $40.000,000. Approximately 1,000 acres of this land has been filled in, while the greater part of the balance is tidewater flat. This flat, which borders on the large deep-water anchorage occupied exclusively by the fleets of warships on their visits to San Francisco, is composed largely of gravel and coarse sand, overlying a hardpan base more than 100 feet thick and with few soft spots. Its character has been proved by excavations and borings for shipyards and other industries in the neighborhood, and the naval engineers have declared that it furnishes a firm natural basis for the foundations of concrete wharves and drydocks, piers, warehouses, machine shops and other heavy structures necessary in a naval base, battleship repair plant and supply station.

The disposal of the matter of buying a site by the gift from the city of Alameda reduces by at least one-half the cost of the naval base. The plan as formulated by the Navy Department calls for the expenditure of $26 529,950 in fifteen years on this new base and on the present navy yard at Mare Island, of which more hereafter. The first expenditure for the new base at Alameda is placed at $1,700 000 for 1926, with a similar amount every year for twelve years, completion of the base being contemplated in 1938. This accounts for a total expenditure for construction work on this base of $20,400,000 in twelve years. Naval experts and naval repair men and engineers on the Pacific Coast estimate, however, that at least as much more will be required in the way of added appropriations before the plan is complete. It seems to be a conservative estimate that this naval operating base, exclusive of the land on which it stands, will cost ultimately a figure not far from fifty million dollars, although there is no official authority from the Navy Department for this figure.

The term "naval operating base" means a place at which are gathered all the facilities requisite to maintain in repair, supply, fuel, munition, and care for a fleet at battle strength. The fleet includes vessels of all kinds, from the largest battleship to the smallest subchaser; and would involve, in this instance approximately 700 vessels of all kinds, should the United States become engaged in a war on the Pacific Ocean. The San Francisco bay naval operating base, with the fleet headquarters, home port and battleship repair plant at Alameda—which is the matter under immediate discussion—will be a total effective organization extending from Alameda, opposite San Francisco city, to Mare Island the present navy yard, thirty miles to the northeast.



Graphic chart, made from data in the possession of the United States Navy Department, showing the location of the proposed naval operating base at Alameda, and its geographical relation to other points on San Francisco Bay, including the Mare Island Navy Yard.

Such a naval establishment, made complete by the home for battleships at Alameda, would include the existing fuel depot at Tiburon, on the northwestern shore of San Francisco Bay; the receiving station on Goat Island; a naval airplane station for which there is abundant room on the Alameda lands; the naval radio stations around San Francisco Bay; the navy yard at Mare Island, to be used for the repair and maintenance of cruisers of light draft, tankers, hospital ships, destroyers, submarines, subchasers and similar craft smaller than battleships; the Alameda battleship base; the several "farms" of crude oil storage tanks located along the eastern shore of San Francisco Bay; and all necessary piers, wharves, warehouses, shipbuilding plants and transportation lines in San Francisco, Oakland, Berkeley, Alameda, Emeryville, Richmond and other places along the shore of the bay.

In view of the tremendous size of this project, and the large amount of money involved in bringing the battleship establishment to completion—the other elements above mentioned already being in condition—it is of interest to note the reasons advanced by the various committees and commissions of naval officials and naval construction experts who for the past several years have been investigating the subject. The reasons for establishing this naval operating base, as voiced by these committees, may be summarized as follows:

First, that the next great war in which the United States takes part will be fought on the Pacific Ocean.

Second, that Mare Island Navy Yard, while well equipped, is too far distant from the deep water of the Pacific; that the approaches to Mare Island are too narrow, tortuous and shallow for modern battleships; and that there is not room in deep water adjacent to Mare Island for the anchorage or maneuvering of large war vessels.

Third, that the main reason for the selection of Mare Island for a navy yard—fresh water of the Napa River, in which barnacles and other sea growths would be cleansed from the hulls of wooden warships—has become obsolete with the use of steel ships, guarded with metal paint; and that Mare Island, owing to its natural limitations, cannot be expanded to meet the demands of modern fighting fleets.

Fourth, that, while the Atlantic Coast has six navy repair yards, at Portsmouth, Boston, New York, Philadelphia, Norfolk and Charleston, there are only two—Bremerton and Mare Island—with the destroyer repair base at San Diego, on the Pacific Coast. The distance from Portsmouth to Charleston, on the Atlantic Coast, is only 900 miles, with four repair yards in between, while from Bremerton to Mare Island, on the Pacific Coast, is an equal distance, with no stations between.

Fifth, that the Atlantic Coast is well equipped with berthing, docking, repair and supply facilities for modern battleships of the largest size, while on the Pacific Coast, these facilities are at present limited to the yard at Bremerton, on Puget Sound. That is to say, the Pacific fleet, consisting of battleships, scout cruisers, destroyers, submarines, subchasers, airplanes and seaplanes, tankers, colliers, supply ships, hospital ships, and so on, can be cared for adequately at only one point in all the distance between Canada and Mexico.

Sixth, that the distance to Hawaii, the advance operating base of the American fleet on the Pacific, is 2,100 miles from San Francisco, as compared with 2,400 miles from Bremerton, and 2,278 miles from San Diego. Time is a most essential factor in modern warfare, and, according to the naval experts, disaster would result if the Pacific fleet were to base, in time of war, on Puget Sound alone. Yet, in time of war, this would be the only base that the fleet would have, under present conditions.

These are the conditions which, in the opinion of the Helm Commission, appointed on this subject by act of Congress, and the board headed by Admiral Josiah S. McKean, at present in command at Mare Island, as well as the Rodman Board and the Ball Commission, necessitate the establishment of a second naval base of the first class on the Pacific Coast. It should be understood that there is no idea of eliminating Mare Island as a navy yard; indeed, the establishment there is to be increased by a drydock, and by other improvements, for which funds are provided in the appropriations carried in the Naval Omnibus Bill. The Bremerton naval base also is to be strengthened, while the San Diego destroyer repair base probably will shoulder virtually all the repairs and maintenance on these wasps of the sea. It is primarily and essentially for the big battleships that the Alameda naval operating base is so urgently needed.

The development of naval bases along the Pacific Coast has occupied the attention of the Navy Department, its engineers and naval experts, and the officers of the American Navy for more than fifteen years. With the exception of the Bremerton plant, and the new San Diego establishment, the resources for the repair, maintenance, harborage and supply of battleships on the Pacific Coast have been completely outgrown both by the navy and by the individual modern ships.

The Pacific Coast is the first line of defense. The establishment of a fleet base on San Francisco Bay will add protection to the entire western half of the country.

VIEW FROM VALLEJO

Left—The oldest known picture of Mare Island, drawn and lithographed between 1850 and 1860. This drawing is made from the Vallejo side of the Napa River, and shows San Pablo Bay, an arm of San Francisco Bay, beyond Mare Island. Right—Mare Island from Vallejo in 1923. This is a companion photograph to the drawing of the same section of Mare Island made in 1858-60.

Crossing the Mud-yellow Danube Into Rumania

Government in Hands of a Few, Because Three of Four Are Illiterate; Finances Are Indeed Elusive and Nation Is Declared Bankrupt

By SAMUEL CROWTHER

HAVING sat up all night in a rickety old train that crawled through the Balkans from Sofia, we eventually landed about noon on a broiling hot day at Ruschuk, which is the Bulgarian port on the Danube—the Blue Danube, which is always mud yellow. The ferry across the river to Rumania would leave at six. It had not occurred to anyone that a fifteen-minute river trip might be made more than once a day, or that there could be any point in having the boat connect with the train, or in having the Rumanian train on the other side connect with the Bulgarian train or even with the boat. For I found that, after a six-hour wait for the boat, we should have at Giurgevo, the Rumanian port across the river, another three-hour wait for the train to Bucharest. Waiting means absolutely nothing in the lives of these people.

At the dock were plenty of rowboats. I tried to hire one. The lowest price, translated from leva into dollars, footed up to about twenty dollars. Not one of those men had ever seen that much money. It was a compliment paid to us as Americans. I told them that individually and collectively I would see them in a much warmer place than that dock was before they got twenty dollars out of me. That illustrates another trait common to all of these peoples. They would rather try to charge an exorbitant price and get nothing at all than to charge a fair price and get something. Finally, we arranged to go across in an old launch which a party of students had chartered.

The Trip to Bucharest

BY THAT time the passport and customs officers had disappeared for dinner. The official family, guarding the interests of the King of Bulgaria in this ten-by-twenty shanty on the dock, consisted of eight persons. All disappeared at once, leaving five soldiers to see that nothing happened to the kingdom while they were away. We went up into town to another government office and there four able-bodied men assisted in putting a rubber stamp on our passport. The passport officer at the dock, we learned, was not in the rubber stamp division. He just looked at rubber stamps which other officers put on passports. When the dock gang finally did show up, they were inclined to be technical about examining our baggage to collect export duty. Landing in Rumania, we went through the same nonsense, except that I think altogether twenty men were involved. The net result was one impression of a rubber stamp and some stickers on the bags.

Then I drove up to town to find an automobile. The town had been shelled by the Bulgarians and Germans from across the river during the war. Here and there was a shattered wall or a gaunt, roofless building. Nothing seemed to have been repaired. I dug up two cars in the town, one a Ford and the other a Fiat. The Fiat was big enough to hold our luggage, so we hired it. I have an impression that it was the first Fiat ever made. It took two men to run it. One worked a pump and the other managed the wheel and the various other contrivances. The springs had long since resigned as springs. A tractor going at full speed over a hard stone road would have been quiet by comparison. The road was broad and rutted, still torn by the troops and artillery that had gone over it.

We broke down twelve times and along in the night we pulled into Bucharest, the capital of Rumania and rather a fair city in its way, which is supposed to be the Paris of the Near East. It is Parisian in much the same way that the Danube is blue. The people stay up late, but just why I could never discover, unless it does not occur to them to go to bed. There is not more than the ordinary amount of vice. There seems to be less than the ordinary amount of gaiety.

Unlike Other Nations

NOW, I have sketched in this scenery, not so much for itself but to show something of the approach to things. The Rumanians are quite unlike any other people anywhere. They claim to be descendants of the Roman legions that held the Danube. They are more like Latins than their neighbors. Their language has a derivation which is sixty per cent Latin. They are tremendous talkers. They are insensate politicians. I went to a vaudeville show, which included a political parody as the main attraction. It was introduced by an actor who spoke for half an hour. There was no action in the play itself. The actors just came out and talked and talked. I stood an hour of it without finding out what was going on.

Rumania is the land of politics, not so much because of deep political interest as because only one of every four persons can read or write, and thus government is in the hands of a comparatively few who do nothing else. Politics is not a profession, it is a business and on a purely business basis. Rumania is a kingdom, having been sliced off from Turkey back in 1877, but King Ferdinand is practically without influence. Queen Marie is of a different type. She was a very beautiful, and is still an exceedingly clever, woman, who has a way, if not of shaping events, at least of being on the right side at the right time. The real rulers are the Bratiano brothers, who, off and on, have been in power since beyond the memory of man. Jon, the elder, is prime minister, and Vintila is minister of finance and the real ruler of the country, insofar as it may be said to be ruled.

These men represent the old landowning class. Before the war Rumania was in the hands of a comparatively few great estate owners, who passed their time between Bucharest and Paris and seldom saw their own properties. One Rumania consisted of peasants working on the land or doing their time in the army. The other Rumania consisted of the estate owners, the politicians, and the army officers. And that has brought about a curious situation, so that today Rumania is neither fish, nor flesh, nor good red herring.

Rumania is almost wholly agricultural. It was the wheat country of Europe. But also it is the petroleum country. The Germans had to have both oil and wheat for the war. The Rumanians, when they entered the war, instead of guarding what they had, started in to take what they had wanted for a long time—that is, the district in the Carpathian Mountains which we know as Transylvania and which belonged to Hungary. The Rumanians are not good soldiers. They have no sense of organization and also they are either very high or very low in spirits. The Germans came in and took the wheat fields and the oil fields with very little trouble, and with Bucharest as headquarters occupied Rumania until the end of the war. Part of the oil fields are owned by the Standard Oil Company, and the adventures of the Americans who managed those fields and who destroyed them before the German advance are a story all in themselves.

Aristocrats Turn Radical

AFTER the war, the Bolshevik mania threatened to break out in Rumania, as it did in Hungary, and overnight the conservative, aristocratic government turned radical, or, rather, put on a radical act and began to do everything the Bolsheviks might have done, just to take the wind out of the really radical sails. They split up the big estates into small holdings and gave them to the peasants. They took over the control of prices and of exports, and they instituted a program of state socialism by which the state was to own and operate nearly everything. While this was going on, the peace delegates were busily presenting Rumania with new territory. They received Bessarabia from Russia and Transylvania from Hungary, and also they received as neighbors the newly formed republics of Czecho-Slovakia and Poland. The total area was increased from something more than 50,000 square miles to 120,000 square miles, and the population increased from 9,000,000 to more than 17,000,000. The new peoples added did not want to be added. Transylvania has a larger Hungarian and German population than it has Rumanian and it is kept Rumanian today only by large garrisons. Bessarabia does not care much what it is, but the Soviet government has made it known that whenever it gets the time it is going to retake the section. That might seem to be trouble enough, but it is only part of the story, for the Rumanian Government came out of the war without any money and has not had any since.

The government borrowed money for a while but practically all its foreign obligations are in default and it is now trying to refund them. It has raised most of its money simply by printing it, and the lei, normally worth about twenty cents, was around two hundred to the dollar when I was there, and it had been worse. No one knows what the lei is actually worth or whether it is worth anything. The currency is supposed to be backed by gold. The gold reserve, as well as the crown jewels, were hurried off to Moscow when the Germans came in, and they may still be in Moscow, although the best opinion is that they have long since been enjoyed by the Bolsheviks. However, they are still carried as an asset in the national balance sheet! The Germans, when they came in, managed to find more gold. This they sent into Germany and issued a special bank note in Rumania founded on a gold reserve said to be in Germany! Rumanian finances are elusive.

Much Sold on Credit

WHEN the boom was on in 1919, salesmen from England, Italy and France swarmed into Rumania and sold the merchants whatever they wanted to buy. It was easy to sell because currency was everywhere in the first stages of inflation. All the sales were on credit. When the notes came due they were mostly extended. Then the lei began to drop and the merchants could not begin to pay these debts in foreign currency. Now all these private debts have been gathered together and an arrangement is being made to pay them over a term of years.

Rumania is bankrupt from every angle, and the politicians are totally unable to do anything more than talk. If anyone fancies government control, one look at Rumania ought to be enough. The price of wheat is controlled, but it is controlled below, not above, the world market price. The government has heavy export taxes on wheat and all other farm products. The peasant, being his own master for the first time in his life, does not know how to manage his small land holdings. Large-scale farming has changed to small-scale farming. In addition to that, he sees no reason for raising anything beyond his own necessities, especially since he gets so little for what he sells. But, although the farmer gets very little, adding the export tax to his price brings the wheat above the world market price and so the European countries, which were formerly fed by Rumania, buy elsewhere. It is the same with cattle.

None of the politicians have ever been in business. They think that business is something to be taxed. They have practically taxed it out of existence and at the same time have attempted to control prices. I had a suite at the best hotel in Bucharest at the controlled price of about a dollar and a half a day, but the furniture was ragged, the water in the bathroom only ran now and again, and there were no towels. The hotel, which had a large dining room, did not serve meals. The whole place was dirty and the only servants were Russian refugees who would work for nothing. The income was controlled, but the outgo was not, and the place was simply passing out.

Are Hungarian Cars

THE railroads have very few cars or locomotives. An illustration of the ethics which prevail may be seen on many of the passenger and freight cars. They bear Hungarian names, across which a paint brush has been drawn and the Rumanian inscription written above. When the Rumanian troops went into Hungary after the war to put down Bolshevism, they seized all the cars and locomotives they could lay their hands on and brought them home under the pretext that they were needed for the transport of troops. Not a car or a locomotive has ever been returned.

In the midst of all this mess, Rumania is supposed to be supporting an army of half a million men, although no one knows how many people are actually in the army at any one time, because the soldiers have a habit of going home more or less when they so feel and always for harvest. I noticed that many peasants were working in the fields in army uniforms. This army is not for stage purposes. It exists in accordance with the conditions of what is known as the Little Entente, an offensive and defensive agreement between Rumania, Czecho-Slovakia, and Jugo-Slavia, sponsored by France. But also it exists to guard against a possible attack by Hungary to recover the territory delivered over to Rumania by the Treaty of the Trianon.

Crossing into Hungary, one gets the distinct impression that while Hungary is down it is not out. We do not know much of the Magyars here in America. We know them only as husky, unskilled workers. We know nothing at all of the ruling class or the old landowners. The real Magyar is a fighter and a farmer. He will not go into business. The business of Hungary has always been in the hands of the Jews. A Magyar believes in independence but not in democracy and he thinks that being a Magyar is about the most important thing that anyone can be. Hungary was not merely a dependent in the old Austro-Hungarian empire. It was a separate kingdom and it had its own legislative body and its own currency and many of its own laws.

The Hungarian Dictator

THE government was on the losing side in the war. By the peace it was cut to the City of Budapest and a small territory round about. It formerly had twenty-five million people with a territory about equal to that of Ohio, Indiana, and Kentucky together. Now it has less than eight million people in a territory about the size of Indiana. Like Germany, it had a revolution in the autumn of 1918, which ended with the abdication of the king and the setting up of a provisional president. Then came the Bolshevik revolution under Bela Kun, which lasted for one hundred and twenty-two bloody days. The Rumanians helped put it down. This Red terror was followed by a white terror and Admiral Horthy became, and still is, dictator.

It is not merely a dictatorship in name. It is a stern fact. It is a dictatorship that has to be admired in a way because it is courageous. The country has no business and it gets its money by printing it, so that the currency is going the way of Germany's. But there is no cringing. The people speak of the territory taken from them as "the occupied provinces" and expect to get them back. They frankly say that they would start a war if they had anything to fight with. They would like to have a loan such as Austria got, but they are not willing to take it under false pretenses. They will probably get the loan.

In the midst of so much cant and hypocrisy, the Hungarian stand is to be admired in that at least it is honest.

Mr. Ford's Page

IT IS curious to note the prevalent feeling that the present excitement at Washington indicates that at last the government is on the job. There is a type of mind whose conception of progress is measured by the amount of trouble stirred up. To say that the present disturbance at Washington indicates that the government at last has got on the job is the same as saying that the chauffeur who is trying to right an overturned automobile is at last on the job: the chances are that if he had been on the job in the first place the trouble might not have occurred.

To hail the present disturbance as in any way representing the proper function of government is to lose sight of the purpose for which government exists. If political service consists only in discovering crookedness, or in successfully maneuvering partisan hindrances, or in creating embarrassing situations, then let us understand it so. But if political service consists in administering the affairs of the people in a manner certain to increase their welfare, we shall see that however necessary it may be at times to discover and expose misdeeds and their doers, it is still not the main business of government, and at its best can only be regarded as an unavoidable hindrance.

> *IT IS no proof of efficiency in government that certain public acts are being investigated. It only proves the previous inefficiency of our system. Yet some endeavor to reap glory from the present situation as if it indicated that government was at last becoming effective. As investigations and their causes are not the main business of nations, they should never be confused with that main business. Unless they teach us how to avoid the necessity for future investigations, they are a total loss of time and money. It is not the interesting nature of the material turned up, but the extent to which the probe is driven back behind the scenes, that makes investigations valuable. The oil men had everything signed, sealed and delivered in half the time it takes us to get an investigation partially started.*

The business of a university is not to devote itself exclusively to discovering and punishing the misdeeds of the students. While this must sometimes be done, it is recognized as an interference with the proper functions of a school. No professor's service to a university is measured by the amount of scandal he can turn up on the campus; the worth of a faculty is known by the atmosphere it can create, in which unworthy aims cannot live. Even the policeman is not judged by the number of persons he lays by the heels and hails into court, but by the degree of order which he maintains on his beat. The factory does not exist for the hiring and firing of men and for shop disputes which have nothing whatever to do with production; these are secondary issues, and if they are allowed to interfere with the service which the factory can render the public then they become positive menaces. Every main business has its side issues of dispute and error, but when these are allowed to become themselves the main issue, it is the end of constructive work.

So, while it is just and proper that the misconduct of public officials should be made the subject of inquiry, such inquiry should not be extolled as the main business of government. There may be a thrashing going on in the headmaster's office, but the rest of the school is attending to its proper business.

It requires no special wisdom to see that if the standard of service to the country is to be the exposure of wrongdoing, there must be kept a constant supply of wrongdoing to permit of the service.

Correction is not construction, unless by making the correction we learn how to prevent the error being made again.

So far there is no indication whatever that oil leases are going to be made under any different system than that which has prevailed in the past. Of course we should not need any different system if all men were honest; honesty and ability get along pretty well under any method; but as we are constantly being reminded that all men are not honest, it would be only plain business wisdom to consider how even their dishonesty could be prevented from working disadvantage to the people. To go on forever undoing things which never should have been done, is a most wasteful way of using time and energy.

The question is, What is the country going to learn from this investigation? Are we to learn only that certain interests go about continually seeking what they may devour? that officials high and low have social and financial connections with those interests? that other officials have "inside information" on which they gamble, the public's rightful information being withheld for private benefit? that there is a wide bi-partisan, non-partisan fellowship of graft and "gentlemen's agreements" permeating both the business and the political worlds, that they interlock, and that the plain citizen never knows what interest is addressing him when he reads a business proposal or studies a political pronouncement? If that is all we are to learn, it is only fair to say that we have learned it all before, that in the realm of political graft and trickery there is nothing new under the sun.

If that is all we are to learn, the net result of these upheavals is "hot stuff" for the newspapers, and the party advantage of the partisans who first got the drop on their opponents. And it affects the government no more than the discovery and arrest of a pickpocket. In brief, it isn't worth the hundreds of thousands (in its wider extent, the millions) of dollars which the affair is costing the people.

Now it seems pretty clear that the question, What is the country to learn from this? is to be answered—"Nothing, unless the investigation is extended to the deeper sources of the wrongdoing." In the present situation, whatever wrong may have been done did not begin with the government, nor with the officials involved, but with the world-girdling interests. These may be conceived under the name of "oil" if desired, but oil is but a part of their wide concerns. It now develops that ours was not the only government with which this oil interest had negotiations, but that governments of other nations were involved, and in such a manner as to lead them to judge it expedient to halt the negotiations at once. That is, oil is international, and as no American is international, the source of the corruption must be sought elsewhere. Here is a big lead, and it remains to be seen whether we have men big enough and courageous enough to follow it. There will probably be no immediate popularity for the conductor of the process.

This is in no way intended to judge the matter of the leases in question. It would be a surprise if any oil lands left in possession of the government were worth leasing. But it is intended to say quite definitely that as long as there are those who believe that this is a larger matter than a questionable transaction between individuals and that it may prove to be a matter between the dark forces of the world and the white forces, it is desirable that the present investigators cease to be satisfied with following ordinary police court methods, and probe deeper, after the manner of philosophic students of world currents, to find what is deeper even than Fall or Sinclair. These men are incidents. And to limit the investigation to a man-hunt is to develop a subtle form of evasion which allows it to be understood that the investigation has investigated what it does not investigate.

It may be said, however, that the counsel herein contained is given with no expectation that it will be accepted. Already the affair is developing into the "geeing" and "hawing" of politics. It must be said that if what has on certain days transpired in the Senate Chamber with respect to this business were to transpire in any business conclave, the rating of the seriousness displayed would not be very high. Senators, elected to be senior directors of the business and policies of the United States, are wasting their time and our time if they do not forget party and think of the interests of the United States as a going concern.

The fact remains that the oil men got the departmental method changed, got the President in line, got the Secretary and Assistant Secretary of the Navy to see the point, and got the leases signed and delivered much more quickly than it has taken the whole United States Government to set up the present state of facts. The comparison is not flattering to us.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Investigations—Before and After

INVESTIGATIONS have a bad reputation in the United States. They usually transpire too late to rectify the wrong, or they seldom proceed far enough to disclose the root of the wrong. At this writing, even in the most sensational investigation of recent times, the hold-up is coincident with the disclosure of the bi-partisan nature of the suspected acts. In the investigation which was made into the Veterans' Welfare Bureau, the Forbes mess, it is open talk that the whole procedure was suspended just in time to prevent disclosures involving persons who did not care to be involved. The Teapot Dome affair cannot be settled by the resignation of Mr. Denby—who was the least implicated man in the whole affair; it cannot be settled by mere legal inquiry into the character of the leases; if it is not to become a body blow at American confidence it must proceed until the last fact has been sifted and the last participant brought into the open.

But perhaps the main reason for the bad reputation of investigations is that they resemble the agitated locking of the barn after the disappearance of the equine occupant. We have made no provision for investigations except on suspicion of crime. When the suspicion does not arise, when the alarming fact does not leak out, the investigation does not take place. There is no board of review, no committee of inspection, in the normal course of government procedure. There is no body of officials commissioned to ask of any public transaction, "Would this be wrong even if it were honest? Would this be right, even if bribery had occurred?" There is a contention now that the leases were all right as leases. If they were all right as leases, then the matter of this or that official being financially interested in them becomes quite another question. The supposition is, of course, that if it takes "loans" or any other form of financial favor to put public business across, there must be something wrong in the business—either inherent in it, or inhering in the purpose to which the deal is afterward to be used.

Why should not all public matters be subject to review? Why should not all public officials, as a matter of self-protection, require the inspection of a disinterested body of public servants? The nation will probably have to come to that to save its face. It is most humiliating to see blazoned in the press of England, France, Germany and Russia the peculiarly petty form which American official dishonor takes. True, we are mere amateurs in crookedness; which indicates that we have no right to be in it at all.

But now the matter reaches further than Teapot Dome. The Department of Justice is involved. The Department of Commerce has been challenged. Even the Department of State has been the subject of hostile mention. And perhaps it might be just as well to extend attention to the War Finance Corporation.

Why Not Issue Money on School Bonds?

ROME, Georgia, is contemplating a loan of $500,000 for the purpose of securing the money to build new schools, which are said to be an absolute necessity, but it is feared the taxpayers may not approve the project, because of the burden of taxation the interest and sinking fund requirements would add to an already large budget.

Recently, THE DEARBORN INDEPENDENT stated that such bonds might be used by private banking corporations to secure government-issued money *through the Federal Reserve System,* and asked why the people themselves ought not have the benefit of direct issue of the currency upon deposit of their bonds in the Treasury.

In response to the editorial, letters came in large numbers from every quarter of the Union among them, some denying the truth of the inference that school bonds are accepted by the Treasury as security for currency issue. Our critics were apparently not aware of the provable truth of our statement.

The *Treasury* accepts only certain obligations as security for currency issue, but *the Federal Reserve Banks* may deposit available securities *ad libitum,* draw the money and invest it in any bills it desires or loan it to member banks on rediscounted paper. What is the difference?

But Rome, Georgia, needs $500,000. If she issues bonds under present laws, they will probably run for 30 years at five per cent. This means an annual interest charge of $25,000, a sinking fund item of $16,700, or an annual tax of $41,700, and when the last bond is retired *Rome, Georgia, will have paid one million, two hundred and fifty thousand dollars for five hundred thousand dollars' worth of school buildings,* which will be ready for demolition by the time, if not before, they are paid for.

The United States of America will provide that $500,000 on the basis of commercial paper deposited with it. Its own bonds are denied the circulation privilege. State bonds for highway improvement are not acceptable for deposit, but are utilized indirectly, as are county, municipal and other public bonds. Are not all of these as good security as are the acceptable commercial papers? And could not the people have public improvements at cost if they could go to the government direct, instead of being compelled to borrow the government's credit from money-brokers? The government receives no interest on the notes issued to the Federal Reserve System; it need not from a political subdivision.

Every safeguard in the matter of limitation as to amount or purpose of bonding now in force would remain, while currency issued on them would be retired as fast as the bonds are canceled, avoiding all possibility of dangerous inflation.

Rome, Georgia, needs $500,000 for new schools. Why compel her to spend $750,000 for its use, when those who will lend her the money get it at cost?

Dawes, American

IT IS pleasant in the welter of public life to come upon a personality that one can frankly like. Liking such a one does not assume that he is free of error, but that his face is turned in the right direction and that he goes heartily, even if sometimes blunderingly, forward. Most people on this side of the water are coming to like Brigadier-General Charles G. Dawes, who is neither the military man which his military rank would indicate, nor yet the banker of his daily avocation: he is the ordinary common-sense American, unawed by anything save the fact, and who feels it is not presumptuous to inquire first, "What is this all about?"

Doubtless General Dawes has been fortunate in his press. He is on the track approved by those who make or break reputations in the press. But even were he not, his matter-of-fact method of attacking problems would win the admiration of all who were permitted to know it. Dawes has the qualities of a first-class shop foreman who knows his business—and that is no mean praise, since, as everyone knows that the sergeant is the heart and core of the army, so the foreman is the man in whom shop policy blossoms or dies. Dawes is a man who can be depended on to get things done and make friends instead of enemies in the process. He is a living disproof of the theory that to be efficient one must be a bull in the china shop.

Dawes said something the other day that shows his grain. He said that he was glad that France was in the Ruhr because it forced the world to face the facts. Perhaps nothing that France has ever done has been so unpopular, so questionable in the public opinion of the world, than the occupation of the Ruhr. Yet there were so many extenuations of the act that it was difficult to form and pronounce a final opinion one way or the other. Dawes gets at once beyond the initial elements of the problem and asks what France's presence in the Ruhr has done for the world. And his answer is that it has forced the world to face the whole problem of German reparations. It is a sensational observation for Dawes to make, yet its truth, simplicity and candor will render it immediately acceptable anywhere.

"Certainly I said it," said Dawes to the Associated Press. "I said it and I stand pat on it." And his famous pipe took its familiar upward angle.

Dawes' large possession of the good will of the American people is due to their belief that he goes at things the way they would go at them. It is so simple a path to popularity that the surprise is so few public men take it.

Fighting a Picture

IN THE Boston Public Library, among other famous paintings which all America knows, is John Singer Sargent's "The Synagogue." A symbolical canvas, it shares a wall with its sister painting entitled "The Church." Justly ranked as one of the great paintings of the great collection which Boston has assembled, it has nevertheless been unfortunately made the focus of a peculiarly disagreeable form of racial sensitiveness. The Jews object to it. They have demanded its removal. They have circulated petitions, alleged the most debased motives, held meetings, published denunciations, stormed legislative chambers, stopped at nothing to get the painting put out of the way. It was offensive, they said, to Jewish sensibilities. This opposition to a mere painting was so well organized and obeyed orders so implicitly that it was made to appear almost as if the library trustees of Boston had loosed a pogrom against the Jews, and the usual cry of "persecution" sounded through the length and breadth of the land. One young Jew, of a temper prophetic perhaps of what America will do for his race, had the good sense to remark that he thought the fuss was out of all proportion to the cause.

So up to the legislature went "The Synagogue," hailed there by the chief priests and rulers of the Jews, and in the lower house of the Massachusetts legislature "The Synagogue" was doomed and ordered forthwith to be removed. The order was rescinded in the senate, which apparently was not so overawed by the attack.

And there "The Synagogue" has remained until just the other day when some miscreant, as yet unidentified, hurled an ink bottle at it, splattering it sufficiently to require serious attention. The criticism of the bottle-slinger was just as intelligent as the criticism of the word-slingers who preceded him.

Who are the four greatest men? No one can tell, for the four speedily increase to one hundred. But one of the experiences of life is to know a man universally regarded as one of the "greatest" and to see how he regards greatness. It is a pity and a public loss that true greatness is made to appear so distant from the people. The four greatest men recently chosen in America are men across whose minds the thought of greatness has never passed, and who receive any mention of their greatness with distinct disfavor.

It might be considered a tactful act if the Cabinet would renew its offer to resign in a body, which it made at the time of President Coolidge's accession to office. To do so would furnish a generous covering for members whose presence is plainly embarrassing to the President, while at the same time it would leave the President free to signify whom he would like to remain. It is now seen to be a serious mistake ever to have agreed to retain the entire appointive staff of President Harding, though it is well understood in what spirit the announcement of retention was made. It is beyond question now that there must be resignations or removals from the Cabinet on account of the oil lease exposure. And, leave oil leases aside, there are other resignations which could occur without prejudice to the resignees and with great benefit to the Cabinet itself.

The contest for the Presidency in the next election was never a more open matter than it now is, granting of course the nomination of Coolidge by the Republicans. At no time during which the next election has been in view has there been so much confusion as to persons and issues, nor in fact so little real interest, as their now is. Ordinarily the candidacies of Mr. McAdoo and Mr. Johnson might be matters of public interest, but it is very clear that they are not that now. No one is interested in either Mr. McAdoo or Mr. Johnson except, in the one case a party that must have a candidate, and in the other case a faction that must have a leader. But even the partisan interest does not extend much beyond the bounds of the officeholding or office-seeking members of the party organization, and certainly the Johnson protest is decidedly unimportant. In fact, the country is in a frame of mind to consider the next election all but settled—all over but the voting. And the country will become more deeply persuaded of that if present events at Washington continue persistently to be given a partisan turn. The oil investigation was regarded at first as a pre-election play with immense partisan potencies. Since the bi-partisan character of the disclosures have become clear, interest seems to have flagged.

As an American Student Views Oxford Life

Worship of Tradition Causes University to Miss Many Good Things; Many of the Present-day Customs Are Relics of the Middle Ages

By CHARLES J. BAGLEY

TO AN American student Oxford appears to be not only the birthplace but also the old soldiers' home of tradition. It is unquestionably old-fashioned; even the British admit that. As the oldest university of a very conservative race, it bears worthily, almost proudly, the title, "Home of lost causes." This worship of tradition causes Oxford to miss many good things which have come to light within recent years, but the policy insures the university against being dazzled by some of the useless fads which invade newer precincts. It is wise to "Be not the first by whom the new are tried"; but it is equally as wise to be "Nor yet the last to lay the old aside." In many details Oxford neglects the second half of Pope's warning. A great many of the present-day customs are relics of the Middle Ages and have no practical justification for their existence. This does not mean that I would condemn wholly Oxford's policy of tradition. During my three years there I learned to love many of the old customs which seemed absurd at first acquaintance, and I came to realize that an unbroken tradition of high standards impresses the present generation with the responsibility of their task and so inspires them to their best efforts. On the other hand, too much emphasis on the past has a tendency to make us neglect the present, which alone is ours, and also turns our gaze away from the future, for which we should prepare. Oxford has every right to be very proud of its history, and it is only natural that in the university many old customs should be preserved to remind us of the glorious past. However, it is not my intention here to criticize Oxford traditions, but to describe and explain some of the most interesting customs which have come down to the present day through centuries of time.

Retains Old Customs

OXFORD, I believe, retains more medieval customs and reminders of the Middle Ages than any other university in the world.

Latin, which was once the international language of the universities, has gradually lost its prestige in other places, dropping successively out of use as a spoken language, next out of the curriculum, and lastly even losing its place on the college diploma. In Oxford it is still the official language of the university. All notices of degrees, all ceremonies of degree granting, the commemoration exercises in June, and practically all official ceremonies are intelligible only to those who read and understand Latin. Grace is commonly said in Latin. Every night in the dining hall of my old college (St. John's) the students remain standing while one of the scholars recites the Lord's Prayer, beginning, *Pater noster qui es in caelis,* and ending with *in saecula saeculorum.* At daybreak on May first the choir boys of Magdalen College, dressed in their white surplices, assemble on the tower to sing a Latin hymn to the Holy Trinity. This custom is generally thought to have been substituted for a mass which was said for the soul of Henry VIII, but it is probably a relic of pagan days, like most of the May Day celebrations. I have been told by friends who were energetic enough to be up at this hour that it is a very impressive sight to see these white figures and to hear their song float across the meadows and down the river in the gray dawn. The statutes of the university which deal with regulations of deportment and dress are still published in Latin. Looking through the *Titulus* on *De moribus conformandis* we find warnings against the out-of-bounds sections of the city (*De Domibus Oppidanorum non frequentandis*) and against the universal practice of running around late at night (*De Nocturna Vagatione reprimenda*). This seems to indicate that Oxford students have always been the same. Certain other old regulations persist, such as that forbidding undergraduates to carry crossbows and arrows down the High Street or to shoot marbles on the steps of the Sheldonian Theater!

Escapes Three Years

THESE regulations are enforced by masters chosen from the dons (professors) of the university, the so-called proctors, a sort of superior order of university policemen who go about at night, dressed in cap and gown, and politely take the names and colleges of undergraduates found in places officially out of bounds. There are four proctors and many assistants, the latter affectionately known to the boys as "Bulldogs." Those students who are so unfortunate and so unskillful as to allow themselves to be surprised at a public dance or in a bar after nine p. m. report next morning to the proctors and enrich the University Chest by sums varying from one to five pounds. I had no personal experience with this part of the university system until shortly before the end of my last term of residence. Many successful escapes had rendered me bold and careless. Finally, after consistently breaking both the spirit and letter of the law for two years and eight months, I was "progged" about nine-thirty one evening for the harmless pastime of drinking a cup of coffee in a forbidden restaurant.

This penalty is not aimed at the practice of drinking, but at the ungentlemanly practice of drinking publicly with the townspeople. Proof of this is seen in the fact that students may purchase wines from their own college store. Ale and stout are the most popular beverages in the dining halls, and champagne is served during the big college dances in commencement week. Port is also consumed in large quantities as an after-dinner beverage.

Some of the most amusing customs of the university deal with this question of drinking. For instance, on one day of every year the students of Brasenose College may go over to Lincoln College next door and demand hospitality in the form of free beer. If an examiner question a student overtime in an oral examination, the latter may order up a quart of beer at the expense of his master. I have heard of this prerogative being exercised, but I never saw it done. As a matter of fact, I was kept overtime myself, but I was so relieved to be through with the examination that I freely waived all my rights to beer or to anything else.

Some Drinking Customs

THE custom of "sconcing" prevails in all the colleges. If a student talk shop, mention a lady's name, tell a questionable joke, swear, recite a quotation of more than three words, make a pun, or arrive more than seven minutes late at his table, the senior member of the table "sconces" him, that is, orders up a half-gallon cup of beer at his expense. The beautifully engraved silver cup, kept for that very purpose, is first passed to the offender. If he can drink the two quarts of ale without taking the cup from his lips, he "downs the sconce" and is entitled to drink for a week at the expense of his table. If he fail to down the sconce—and he usually does—the cup passes on and is finished by those on his left. It is an exceedingly difficult feat to down a sconce, and naturally the names of the few successful banqueters have passed into college history. I made many gallant efforts to enter the select circle, but I could never go beyond three and one-half pints at a drink. Any one who thinks that he has been unlawfully sconced may appeal *in Latin* to the High Table, where the dons of the college sit on a dais like the lords of the medieval banqueting halls. Over at New College on a certain day of the year students may drink as many mint juleps as they like at the expense of the college. This custom is fairly recent. A wealthy American at New College, being very much peeved one day over the fact that he was unable to obtain his favorite drink, donated to the college a sum of money sufficient to insure mint julep devotees against any similar humiliation from such unheard-of deprivation!

Out After Nine, Open to Fine

STUDENTS of Oxford during the Middle Ages must have been rather unruly subjects. History records many pitched battles between undergraduates and citizens of the town. This explains why all of the colleges are surrounded by high walls and why the students are still required to be inside at nine o'clock. At five minutes after nine each evening the great bell in Tom Tower at Christ Church rings 101 times in memory of the days when its 101 students were called to quarters by this curfew. Of course, students may return to college at any time before midnight, but in deference to tradition they must still pay a fine of a few pence whenever the gate is opened for them after 9 p. m. It is a serious offense to be out after midnight, and students who "knock in" after 12 p. m. are subject to expulsion. This regulation has made it necessary for late arrivals to scale the walls. Each college has its certain scalable portion of wall which is noticeably worn from frequent use. The old-time fights between "town and gown" and between students of rival colleges still survive in the form of "rags," such as the kidnaping of open-air speakers or in the running off with the movable property of some other college. Undergraduates are nominally under the jurisdiction of the university court, but when they disturb the quiet of the city, the civil policemen either take them in charge or else run them back over the college wall. One night a Canadian friend of mine who had been run back to college for being too boisterous had reached the top of the wall, where he sat in reach of safety, chiding his baffled pursuer. Unluckily for him, his buoyant spirits caused him to lose his balance, and instead of falling over into the college quad, he fell back into the street and was taken red-handed by the waiting "bobby." All students were required to wear academic gowns, as much for the purpose of distinguishing them from the townspeople as for upholding the dignity of their rank. This practice is still enforced, and all students found on the streets without a gown after nine p. m. are subject to a fine. These gowns are also worn to classes, to tutorials, and to all university ceremonies as well. The ordinary student dress today consists of a slouchy tweed coat and flannel trousers which are never pressed. This is probably a reaction against the practice of the Middle Ages, when students wore dress clothes a large part of the time. A survival of the old custom is seen in the white tie, dark coat and black shoes which must still be worn to matriculation, to all examinations, whether written or oral, and to the degree granting.

The degree granting ceremony is a curious one. The vice-chancellor marches in, preceded by the verger bearing the mace of authority, and takes the chair, supported on either side by the two senior proctors. These three represent the executive power of the university. Seated to the right and left are the doctors in their flowing red robes, while the masters of arts stand in the pit, garbed in black gowns with maroon colored hoods. These represent the governing body of the university. All matters of legislation must be referred for final decision to this body which they represent; namely, Convocation, or the total number of graduates who hold either the M. A. or doctorate. In 1921 this body numbered slightly more than 7,000. The entire ceremony is conducted in Latin. The vice-chancellor opens the session by explaining that the present Convocation has been called for the purpose of granting honorary degrees (*honoris causa*). The public orator then steps forward and, introducing the candidate with a long eulogy, recommends him for the degree. The chairman, in concert with the two proctors, puts the question to the assembled graduates: *"Licetne vobis, doctores; licetne vobis, magistri?"* They reply: *"Licet."*

Creditors Are Present

HAVING thus obtained permission from the governing body, the vice-chancellor proceeds to confer the degree, and with further honeyed words and a handshake receives the new doctor into the inner circle. All of this ceremony is routine except the introductory speech of the public orator who has an excellent chance to display his unusual knowledge of the Latin tongue. From the way the classical students laugh, he must say some very clever things at times. I remember his presenting Clemenceau as the *tigrum gallicum* and Taft as *virum illustrissimum et doctissimum.* When the honorary degrees are finished and the time comes for granting degrees to graduating students, the vice-chancellor moves down from his lofty throne and takes his seat in the middle of the orchestra. One of the proctors demands grace for the degree and then proceeds to march the length of the orchestra and back to his seat. During this amusing promenade he passes near the entrance, where unpaid tradesmen of the town used to assemble to pluck his gown, tell him of the student's unpaid bills, and thus hold up the degree. Although this privilege still exists, it has not been exercised for several years.

The story goes that when Lord Birkenhead was an undergraduate ready to take his B. A. degree, he found himself heavily in debt to several merchants of the city. Rather than have them hold up his degree by plucking the proctor's gown, he went to them all separately beforehand and promised that if they would allow him to graduate he would soon be in a position to settle his accounts; otherwise, he would probably never be able to pay them anything. I cannot vouch for the truth of this report, but it is, at least, a good story, since Birkenhead took his degree all right and is now Lord High Chancellor of Great Britain. After the proctor resumes his seat, the deans of the various colleges introduce their candidates in turn, and the degree is conferred on the whole group.

Many other strange things happen at *Encaenia* (Commencement), but as they all take place in Latin, I am not quite sure just what they all are. I used to spend my time figuring out the percentage of bald heads among those wearing doctor's robes and in calculating what were the chances of my getting a doctor's degree without losing the larger portion of my hair.

Many Americans Fret

SO STRONGLY intrenched is tradition in Oxford that there are customs in the university church (St. Mary's), in the university library (Bodleian), and in individual colleges, but it would be too long and monotonous to enumerate all of these. There is reported to be a very amusing provision in the charter of Wadham College. It provides that the warden (head of the college) shall eat a certain number of rice puddings each year. I think the number is 166. The present warden, who is an exceptionally fine sport, remarked to one of the boys one day that he was getting terribly behind with his rice puddings.

Many American students at Oxford become disgusted with tradition and fret over the resulting restrictions. Personally, I never suffered any inconvenience. The annoying customs, such as the requirement about being in college before midnight, may be avoided by roundabout tactics; while the interesting customs, like drinking sconces, may be enjoyed for themselves. I never reached the point where I wanted to pray for the soul of Henry VIII—although it probably needs our prayers badly enough—but I did imbibe enough tradition to color my memories of the old university. I trust that I shall never return to the old town of Oxenford to find students carrying crossbows down the High or to see idlers shooting marbles on the steps of the Sheldonian Theater!

NOTE: The B. A. graduate of Oxford automatically becomes eligible for the M. A. degree at the end of seven years from the date of his matriculation, that is, normally four years after graduation.

Are Ball Players Worth What's Paid for Them?

Some Bring Tens of Thousands Through Gates, Others Are Not Attractions

By A Veteran Sports Writer

PRICES paid for ball players by major league clubs have mounted so high that baseball is coming to be referred to by some of the more facetious newspaper writers as high finance.

In recent years so much has been written and published about these prices that baseball has suffered as a sport for the simple reason that it took on the aspect of a gigantic industry. The dollar mark, set in front of six figures, removes the sport feature to a large degree.

The effect is exactly the opposite of what the magnates, or owners of the clubs, try for. They believe it good business because it brings a great deal of publicity. But, in this instance at least, the owners of ball clubs are poor judges of American psychology.

Not many years ago there was a national sensation when John J. McGraw, then manager of the New York Nationals, paid $10,000 for Rube Marquard, a tall, crane-necked, left-handed pitcher of the Indianapolis club in the American Association. Since that time McGraw, still manager but now also part owner of the New York club, has paid nearly ten times as much for minor league and major league material as he paid for Marquard, while owners of other clubs have paid more than ten times as much.

People are beginning to ask what the ultimate price paid for a ball player will be. Also, many are asking what a ball player can be worth and how to judge his value. It is impossible to answer the first question but in reply to the second it can be set down that the price paid for a ball player is similar to the price paid for a work of art—either is worth any price you care to pay.

The $100,000 Kamm

IN THE autumn of 1922 the Chicago club of the American League paid $100,000 cash for Willie Kamm, a third baseman of the San Francisco club in the Pacific Coast League. Besides the $100,000 Chicago turned over a player to San Francisco and adding the value of this player to the cash paid brings the total up to $110,000. This is one of the steepest prices ever paid for man or beast in the history of sports.

Since baseball is but a vast business, from the standpoint of the owner, the purchase of a ball player must be considered in the light of a business transaction and discussed from that angle. Since the public, or that part of the public which devotes considerable attention to baseball, apparently wants to know what method is used in establishing the value of a player, the case of Kamm may be taken as an example.

Here is a player who was regarded a star in the minor leagues. His value in the lower classification of organized baseball was established and firmly fixed but what he would be worth to a team in the major leagues was merely problematical. You may argue that a player who can do what Kamm did in the minors can certainly do much better than the average in the majors, but the argument does not go in baseball for some of the best men the minors ever produced were never able to make good in the majors, while other men, who were not particularly bright and shining lights in the "bushes," became stars when they were lifted to the big leagues. Baseball is filled with instances of both natures and it is one of the constant puzzles of the game.

Before a player comes into the majors his possible value is merely guesswork. He has to play for a few years until anything like a definite opinion can be arrived at. His probable limit can be fairly gauged. But there was no such knowledge in regard to Kamm. He might make good and then, again, he might not.

Why pay $110,000 for a man who may be either a success or a failure? It would puzzle any successful business man and men that own major league teams are, as we have pointed out, successful business men.

No Flash to His Work

WHEN the Chicago American League club invested $100,000 cash and a player worth $10,000 in a player of doubted possibilities, there were two ways in which Chicago might realize on the investment. First, there was the possibility that Kamm himself might prove such an individual drawing card that thousands of persons would come to the ball park solely to see Kamm in action. Secondly, Kamm by making good might cause the Chicago team to be a contender and by being a contender the team would attract thousands of extra people through the turnstiles. Only in these two ways could the investment be made to pay. It was up to the 1923 season to prove the wisdom of the investment and the 1923 season answered the question: Kamm was a poor investment.

Kamm is probably the best third baseman in the American League. He batted exceedingly well, ran bases intelligently. But, Kamm did not strengthen the Chicago team so that it became a factor in the pennant race and Kamm did not prove an individual attraction.

Chicago, with Kamm in the lineup, did not do so well in 1923 as during the previous season. This was not the fault of Kamm and yet it remains a fact that the addition of Kamm did not make Chicago into a pennant contender.

Using Kamm as an illustration, as we have been doing, we want to show why some ball players are worth a great deal less money than certain other players that lack the playing ability of the former.

Take Kamm! He lacks individuality. He is in no sense a showman. He is a valuable ball player but valuable only to a team and not to the turnstiles, for there is nothing about Kamm that thrills the spectator; he is exactly the reverse. Kamm believes in doing a thing as simply and easily as possible. He believes in the economy of motion. He saves energy. He works on the theory that a direct line is the shortest route to a given point. He moves on direct lines. The showman does not do this.

To illustrate: Kamm judges a ground-hit ball perfectly. A ball is hit far to his right. Kamm "gets" the direction of the ball quicker than any third baseman in his league and he is off quicker. Result: Kamm is in the path of the ball and manages to get set for it. He takes it cleanly and has time enough to make a good throw. There is nothing exciting about that.

Now, were Kamm a showman, he would time himself so that he would have to make a spectacular dive for the ball and follow with a throw while off balance. The throw probably would be bad but he would make the play look so impossible and his very effort would excite such a thrill and admiration that he would not be criticized for the bad throw; the spectators would conclude that he was lucky enough to get the ball.

The trick of showmanship is lacking in Kamm. His aim is always to make the play as simple as possible; showmanship demands that the play be made to appear as difficult as possible. Players with born showmanship manage to do this all the time. A few moments delay in going after a batted ball, a change of direction, a leaping or a diving catch; a late start and a fine one-handed catch where good judgment and the proper start would have enabled the player to use both hands in making the catch and insuring a safe play; a flashy slide where no slide is necessary; somersaulting after a catch that calls for no such exertion; that is the stuff that appeals to the crowd and that is the stuff that brings people through the turnstiles to watch an individual.

When Kamm came into the majors he was expected to perform miracles. The publicity given the deal that brought him to Chicago established the impression that Kamm performed circus feats around third. But when the crowds came out to look at Kamm they saw a player that "got nothing but easy chances." He did not give them a thrill and they therefore classed him with the average run of players.

Managers and players, realizing the technique of Kamm's play, have the keenest admiration for him. They appreciate what he does and how he does it. The spectator does not. The fact that Kamm fails to sparkle with the crowds does not mean that he has failed as a major league ball player for he is an invaluable infielder, but Kamm is not a $100,000 ball player because he does not impress the crowds that he is and owners must depend upon the verdict of the crowds to get back the money they invest in ball players.

Ty the Master Showman

BASEBALL has produced some excellent showmen. Most of them were great players, but a number were not. And then, some of the finest players of all time were poor showmen.

The master showman of all is Tyrus Raymond Cobb, now manager of the Detroit team. Showmanship is a natural trait with Cobb. He is an intelligent and a brilliant one. Babe Ruth is a natural showman but he lacks the intelligence and ingenuity, the brilliance and finesse of Cobb. His showmanship is of coarse caliber. If Ruth had the keener qualities of Cobb he would be an even greater attraction at the gate than he is.

John P. (Hans) Wagner was the best showman the National League ever produced. But Wagner, like Ruth, had natural physical qualities that made him a showman. Wagner was really a great ball player, the best mechanical player his league ever produced, but Wagner's bowlegs were worth more to the treasury of the Pittsburgh club than his playing ability, for Wagner was a delightful morsel for cartoonists because of the bowlegs and he was the most picturesque individual on the ball fields of his league. Physically, Wagner was one of the broadest men that ever stepped on a ball field. He was powerfully built, "along the rugged lines of good old Mission furniture," as one writer described him in 1909 when Pittsburgh won the world championship. He had long arms and he moved low, along the ground. When Wagner fielded a ground-hit ball he reminded you of a huge gorilla, pouncing on it, crushing it to earth. His hands were big and mighty and there was something about this broad human when he came to bat that caught the fancy of the crowds. He should be able to do almost anything; he was so big and powerful. He ran bases by might, his bowlegs giving him a peculiar appearance. He never had form and that is one of the reasons he was so picturesque. He looked awkward but you could not discount the power of him, the great drive, the force his frame represented.

The physical make-up of Ruth has box office virtues, just as Wagner's had. The broad, bulking shoulders and the comparatively thin legs (a build like Bob Fitzsimmons had), the peculiar walk, extremely short steps, the swarthy features of Ruth, his menacing attitude at bat; all these manage to give the longest driver in baseball history a marked individuality.

But Cobb had no physical characteristics like Ruth or Wagner. Nature gave Cobb a physique as near perfect as one can find. There was nothing broad, nor squat, nor bowlegged about Cobb; he was built in perfect proportion. There was nothing to set him apart and mark him with distinguishable physical individuality.

Cobb had to develop himself into a showman. He had to use his intellect, devise means and create opportunities. He made himself the greatest drawing card in the game by the application of psychology. He had a definite understanding of the value of contrasts. His tricks were all artificial; he invented them. The thrills that he introduced were the result of study, planning and keen execution. When Cobb came into the American League he was raw and coarse stuff but he developed into the most polished gem of all time. He knew the value of situations and he thrived on them. He worked up to the high spot of his scenes as a clever actor does. He knew when to reach his climax. He knew how to lead up to a pitch. He, better than any man that ever engaged in sport, knew best how to make the simplest matters appear like the most difficult.

Cobb and Ruth are outfielders, Wagner was an infielder. Wagner started as an outfielder but his great reputation was made as a shortstop. But, there were other men at various positions that proved sterling showmen.

Chase the Greatest

WHAT first baseman has ever equaled Hal Chase? He was the greatest fielder the position has known also the greatest showman. Chase was a remarkable acrobat as well as a great fielder. He had showmanship down to a decimal point. Infielders that have played on the same team with Chase have told us that he was the worst man in the world to throw to. But Chase missed less balls thrown by infielders than any other first baseman. And still he was never on the bag to take the throws. The fact that Chase was a difficult target for infielders made him all the more sensational, for he played deeper than any first baseman before his time or since and he had to travel farther to reach the sack. The infielders were compelled to throw in the direction of the bag, since there was no human target at the point. Throwing at a bag is a difficult problem and the result was that Chase's teammates made more poor throws to first than the infielders of any other major league team. But this flaw gave Chase an opportunity to make catch after catch that resembled a circus feat. He always managed to reach the bag just in the nick of time and since the throw was generally bad, Chase had to make one-handed stabs, scoop the ball out of the dirt, go far to either side, go high into the air, make back-handed catches and running stabs. Chase, who always seemed so much like a contortionist, did feats in taking thrown balls of which no other infielder was physically capable.

Chase was a great ball player as well as a sensational one. Few men have been as efficient in working the hit-and-run game as Chase, for he was always an excellent batsman. Likewise was he a splendid baserunner but it was in fielding where Chase won lasting fame.

When Chase was at the peak of his career one of the best fiction writers of the day wrote a magazine story about a millionaire baseball fan who become stricken with paralysis and was confined to his country estate, unable any longer to attend games. The unfortunate millionaire contrived the plan of having an All-American League team oppose an All-National League team on a diamond that he constructed on his estate. The game took place after the world series and a large sum of money was offered as prize.

The fiction writer used star ball players in his line-up, selecting the best men of the day at the various positions. Then he described the game in detail, inning after inning.

Playing first base on his representative American League team was Chase and one of the plays that Chase made in this mythical game was to come in more than halfway toward home plate when the National League team had a man on third base, one out and Chase guessed that the squeeze play was to be worked. Chase guessed correctly. The batter bunted. Chase pounced on the bunted ball, tagged the batter and threw his body across third base line in time to get the runner trying to score.

What Evers Is to Game

OF COURSE, truth will ever be regarded as stranger than fiction and, in this instance, truth was at least as strange as fiction, for Chase, later on, in a game during the regular playing season, made identically the same play that the fiction writer described in his story. The fiction writer, we happen to know, was describing a play that he thought impossible but, as fiction, interesting. Chase made it real, not once but several times before his career terminated and he is the only first baseman who ever succeeded in making an unassisted double play at the plate.

Adrian C. Anson, the slugging first sacker and later manager of the old Chicago team, was the most spectacular first sacker before Chase, but Anson was more appealing as a batter than fielder. Of the modern first sackers, rather those of the present day, the best showman is Lu Blue of the Detroit Americans.

Probably the showiest among second basemen was Johnny Evers, the keystone king of the Chicago Nationals. He played on a world champion team and was the pivot point of the famous "Tinker-to-Evers-to-Chance" double play combination. In 1908 he took a throw from the outfield and touched second base after a Chicago-New York game had been completed apparently. The umpires were compelled to call out Merkle who, instead of running to second base on a safe hit that scored what seemed to be the winning run, turned and ran to the clubhouse. Evers alone noticed the mistake, compelled the umpires to recognize it and the result was that at the end of the season the Chicago and New York teams were tied for the pennant, had to play off the game that Evers saved and Chicago won. Later Chicago was victorious in the world series, beating Detroit.

The short field has produced several sensational

How Citizens Have Put Heart Into Their City

Middletown, Ohio, Sees Itself as Model When Improvements Are Finished

By EMERSON ROBINSON

IF YOU would understand the spirit of Middletown, Ohio, you must live in Middletown or thereabouts or tarry there for a while. Associate with those who live there and you soon will understand why Middletown has forged to the front in recent years, and you will understand, too, the aspirations of its civic leaders to make Middletown a model city.

They are putting a heart in Middletown. The mold has been prepared and the cast made. Within a few years results of the efforts now being put forth will be apparent, and those who have visioned the future, believe that in another decade Middletown will stand as an example of the ideal American city, politically, physically, morally, mentally and industrially.

This will be occasioned by community effort; real community effort—not the generosities of one man, not the plannings of any single organization like the chamber of commerce, rotary club, or any similar organization but an organization including the whole community, the man who collects the garbage as well as the man who heads the biggest bank or directs the greatest industry.

There are about 4,500 homes in Middletown to shelter its 27,000 citizens.

And there are 4,500 members of the Middletown Civic Association, an organization only recently completed, but already functioning smoothly. This means, of course, that practically every home in the city is represented in the unusual plan evolved to develop community spirit and build up and support community enterprises. This membership has pledged $172,000 to carry on the work of the various bureaus and social agencies, seventeen in all, and they will not be called upon to give to any other activities.

In Middletown now there is no chamber of commerce, luncheon club—nothing that will take the time, the interest or the money of Middletown men and women. The whole is centered in the civic association, which carries the slogan of "Progress Through Service."

DWIGHT E. SMITH,

Secretary to the new Civic Association and originator of the idea to solve the problems of a small community.

It is the idea of Dwight E. Smith, secretary, and formerly the secretary-manager of the Middletown Chamber of Commerce. Smith went to Middletown six years ago to organize the chamber of commerce. He remained as its chief executive officer, and the longer he stayed the less he thought of the possibilities of the chamber of commerce, in its strictest sense, in the real development of a community, especially a small community. So he conceived the civic association plan.

"The idea is practical," said Mr. Smith, "and it fills to every detail the needs of this community. We have received letters from hundreds of American cities and from cities in many foreign countries asking for information about our plan.

"Take, for instance, the Community Chest. Nearly every city has a campaign once a year for that and the money is apportioned among the many agencies whose duties are various. In one city there are more than seventy organizations which come under the chest beneficiary plan. The money is raised and from time to time is checked out to these agencies as may be required. The people give, of course they do, and then forget about the gift or criticize its use. They are not giving as much now as they did a few years ago, with the result that in some places it is becoming more and more difficult to raise the funds.

"Each of the organizations that benefit under the chest plan has a certain overhead expense, and when this is distributed over a number of organizations the total is rather startling.

"Now take our plan, or that phase of it rather. There are seventeen beneficiaries and bureaus under the Middletown Civic Association. With the control of eight of them we have nothing to do. These are the Y. M. C. A., Library, Boy Scouts, Hospital, Girls Training School, Girls' Club, Girl Scouts and Salvation Army. However, each is represented on our board of governors. If any of these organizations has a deficit we make it good but only after we have made careful examination.

"There are nine others whose affairs we directly administer. They are Home Service, Public Health, Ex-Service Relief (in connection with the Legion), Employment Bureau, Agriculture Extension, Contingent Fund (for memorial building), Celebrations and Conventions, Recreation and Municipal Music.

The Manchester Hotel, costing $600,000, recently completed. It's too big for Middletown now but the citizens built it to be prepared for the future.

"Every one of these activities is necessary for the proper development of Middletown. And yet there are only thirty-six paid workers to do all of the work that must be done. There is only one overhead for all. Therefore it is economical and permits more money to be used for the purpose for which it is given. The total overhead, distributed as it is among our membership, is infinitesimal.

"But the greatest benefit is having the entire community interested. They do not give and forget. They are members of the association and they get an accounting of every cent that it paid out and what for. These are burdens which the community must bear and the people know it and they are not going to object when they get the report of what has been accomplished and the work that is being done to make their city a city of service.

"An organization must have the confidence of the public, and it can get this only by giving its support to worthy causes. All must get credit for any accomplishment; not a few, as has been customary in most instances.

"The old idea of the Chamber of Commerce was to get factories. Smokestacks was all they thought about and all they cared for, with the result that America is strewn with wrecked or misplaced enterprises.

"Middletown wants factories, to be sure, but Middletown knows what kind of factories she wants, and when she wants them. There is more to be considered than mere shops.

"If an industry employing a thousand men were to seek a location in Middletown today, the officers would be advised that the housing facilities here were not adequate and that they would have to make provision for their workmen. Housing is a big problem and we do not want a jammed city just to have population. A jammed city leads to discontent, sometimes crime, because the workman cannot be satisfied.

"Another thing: We believe that industry should stand on its own feet. It used to be the practice to donate land or make other contributions to get shops. That is not a healthy plan and if we were assured of getting a shop on condition that the people of Middletown subscribed for $50,000 worth of stock, or any other amount, we would not want it. We wouldn't give a nickel."

It was suggested to Mr. Smith that some of the activities undertaken by the Civic Association were properly considered in some cities as municipal activities.

"Yes, but we are trying to put a heart into the work here," he said. "It is not good for the city to engage in social work. We are interested in the welfare of the individual. When done by the city the changing administrations make it possible to have this work done perfunctorily without heart.

"We want playgrounds for our children so that they may grow up with healthy body and alert mind. We want nurses to attend to the sick and to look after the health of the community so as to lessen disease. We want to engender such a spirit that there will be fewer possible subjects for charity. We want to provide parks and we want recreation centers. We want proper housing, not crowded tenements. We want a contented population, and in Middletown we have made the start."

Middletown is fortunate in that her shops largely are owned by Middletown men, those who take a pride in the city. She is fortunate too in having as her most prominent citizen George M. Verity, a doer of things whose vision built the great American Rolling Mill Plant and who since he went to Middletown twenty-two years ago always has taken an active interest in everything that has been started to help the city. He is president of the new civic association and was one of its campaigners and one of its sponsors. He believes in Middletown as do other industrial leaders there. His shops employ several thousand men and he has never had a strike.

GEORGE M. VERITY,

President of the association and outstanding figure in the industrial life of a nation.

The Middletown spirit has been on its way for a good many years. It was going strong in 1920 when the citizenship subscribed a million dollar civic fund with which to build a new Y. M. C. A., Memorial Home, make additions to the hospital and do various other community works. The campaign and its successful conclusion startled the nation, for it was not deemed possible for a city the size of Middletown to raise so much money. But it was done and it paved the way for the campaign recently completed and its development during the last three years has been a surprise to other cities.

For instance, Middletown, like many other cities in Ohio, faced a rather trying financial condition and under the law it was possible to issue deficiency bonds. The Chamber of Commerce turned over $40,000 to prevent this admittedly bad piece of municipal financing.

In addition $64,000 was turned over to the Board of Education to provide increases in pay for teachers, necessary, but under conditions impossible for the board to raise at the moment. The citizens also paid the greater portion of the upkeep of the library, and engaged in and paid for other communal activities which ordinarily come under the budgets of the city. It was a self-imposed tax to help the city out of a bad financial hole to turn over $40,000 but it showed the spirit prevalent.

Middletown also is fortunate in that she has the city manager form of government and political rancor in its application to local affairs is reduced to a minimum. The officials are behind the new civic association and the commission has a representative on the board of governors

A May Day pageant in Middletown. Five thousand school children took part in this.

The "Ol' Swimmin' Hole," up to date, in Middletown; used daily by more than 600 persons.

Turning Back the Pages of Time

Prehistoric Fossils Unearthed in Mongolia Date Back Ten Million Years; Held to Prove Central Asia the Cradle of Animal Life

By COURTENAY SAVAGE

Published by special arrangement with Asia Magazine and the American Museum of Natural History.

ROY CHAPMAN ANDREWS

THE desert has always been a place of mystery. For ages men have looked on it with awe, peering out across the restless sands and wondering what lay beyond the far horizon. What could the desert tell them of strange men and stranger beasts? Where lay the gold of lost caravans? Where the wealth of cities that had vanished in Time? How could they make the desert tell?

But the silent sands gave back no answer, and the passing ages found men believing that the desert would never tell its secrets.

There came a day, however, when the desert did disclose to man a secret of vast importance, unfolding the years as a scroll and letting a little party of American explorers peer into the past, back into the days when neither man nor mammal roamed this earth, the days when dread reptiles played along the shores of the marshy lands, the earth trembling as their tons of bulk moved about in search of food. In a depression where the Gobi Desert sweeps down from the Altai Mountains of Mongolia were found twenty-five dinosaur eggs. Ten million years ago they had been laid there. Something happened, some vast upheaval of the forming earth, and the eggs were never hatched. For centuries they lay hidden deep under the bluff; but the winds blowing the sand brought them gradually toward the surface, until when they were discovered during the summer of 1923 they were barely hidden. Some of the ten-million-year-old eggs were broken, with the shells lying about, others were whole. In some of them were found the fossilized skeletons of embryo dinosaurs. The eggs are elliptical in shape, like an ordinary egg, about eight or nine inches long, and three inches in diameter, and the shells are heavier than the shells of a chicken egg. Probably before they became fossilized they were leathery in their thickness.

Of course this secret was not discovered without an effort, for nature does not unfold her mysteries to man unless he delves into the far-away places of the earth. And Roy Chapman Andrews, who headed the party that discovered the dinosaur eggs, had plunged into the trackless Gobi Desert hopeful, but not at all positive, that his expedition would find the valuable fossils that they believed lay hidden in their age-old sand graves.

Mr. Andrews, though still a young man, has been highly successful in his various expeditions in the far places of the earth. He has found many fossils of great importance to science, and he has always felt that in the hinterlands of China might be found a link between the present day and the vanished years. The great Gobi Desert is a place of slight rainfall. and there, if anywhere, fossils would be preserved. Then, too, there were many indications that fossils existed in the interior of China. Years ago scientists in Europe and America began to realize that the "dragons' teeth" and "dragons' bones" that could be bought at the drug shops of the Chinese cities were not a manufactured article. but real bones and teeth of great age. China, still an unsettled country, where a scientific expedition is regarded with suspicion by the average native, was then a place where the white man moved cautiously, especially when it came to digging in the earth for so valuable an object as "dragons' teeth." As a matter of fact, the old Chinese physicians who prescribed these fossilized bones and teeth were giving their patients something of medicinal value, for when mixed with sour wine the fossilized "bones" or "teeth" would result in a combination of bicarbonate and acid phosphate of lime.

In recent years, largely due to the efforts of Dr. J. G. Anderson, the Geological Adviser to the Chinese Government, the principal locations where the "bones" and "teeth" were taken from the earth were discovered, and a closer survey of these excavations led scientists to believe that in the even more remote places of Asia would be found fossils that would bridge the years and give answer to many of the perplexing questions that have been raised as to the early animal life on this earth.

One of the firmest believers in the fact that Asia. particularly Mongolia, would prove a rich treasure house of fossils was Professor Henry Fairfield Osborn, president of the American Museum of Natural History, who as early as 1900 expressed his belief that Central Asia was the place of origin of the reptilian and mammalian life which later migrated to Europe and America. Also, he felt that Central Asia might give forth evidences of human evolution.

Following this belief Roy Chapman Andrews, at the head of a party of trained scientists, started in 1921 for China. His expedition was under the guidance of the American Museum of Natural History, co-operating with the American Asiatic Association and *Asia* Magazine. His first work was to establish permanent headquarters for the expedition in Pekin, and to undertake certain preliminary field work in China. When the expedition was ready to move into the little-known region of the Gobi Desert in Central and Western Mongolia, a staff of more than thirty persons had been gathered, and the equipment was carried into the desert by two one-ton trucks, three touring cars, and a caravan of seventy-five camels.

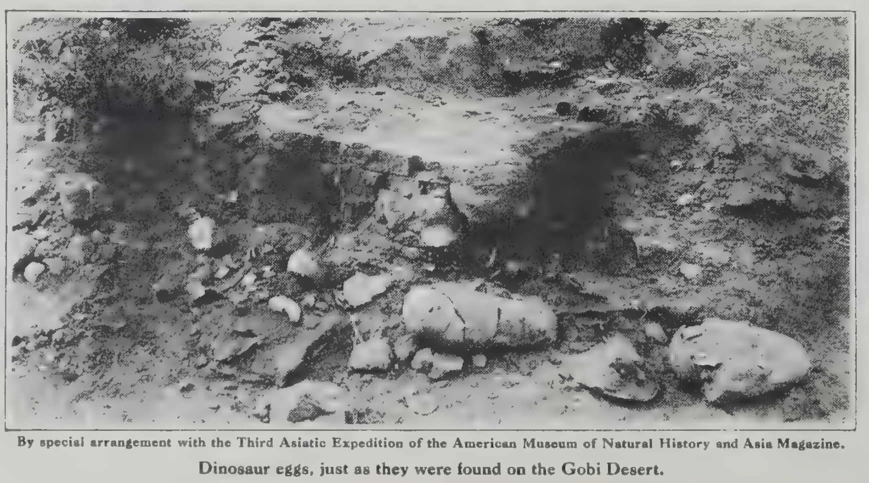
It was really the use of the motor cars that made the tremendous success of the expedition, for during 1922-23 the expedition traveled about six thousand miles, and it is reckoned that if the expedition had depended on camel caravan alone it would have required ten years to have accomplished the same amount of work as was accomplished in two seasons of five months each. In a single day the expedition traveled one hundred and fifty miles with ease, while a camel would require ten days for the same distance. The real use of the camel caravan was to carry heavy supplies, and to proceed to certain points where semi-permanent headquarters were to be established.

When the expedition left Pekin it caused a great deal of comment on the part of the Chinese, who felt that the Americans were quite insane, or they would never be spending their time digging for old bones. When Mongolia was reached and the motor cars, laden with their equipment, rushed ahead of the camels, the presence of the motor cars caused as great a disturbance as would one of the prehistoric monsters whose fossilized bones the expedition sought. The Mongols would be attracted by the sound of the approaching motor, and with one swift glance of terror the men would mount their little horses and ride like the wind, leaving the women and children to any fate that might befall them. Later, when the men learned that the motor cars would do them no harm, they became first curious, and then delighted. They would gather round. touch the strange metal "cart," blow the horn, and yell with joy when the lights were switched on, or water was poured into the radiator. After close examination the Mongols all seemed to decide that air was sucked in through the front of the car, and that this wind fanned the car into motion. For this reason they called the automobiles "chchurs" or "wind carts."

The expedition had been on the desert for only five days when the first fossilized bones of the ancestors of three different groups of mammals were found. When it is remembered that Mongolia, of which the Great Gobi Desert forms a large part, is about the size of the United States, it can be understood that the finding of a fossil bed is not a simple matter. Neither is it a matter of plain luck. Mr. Andrews and his assistants knew the signs of the earth that denote the possible presence of fossils, such as the depressions where the understrata have been exposed by the action of a stream, and with these guideposts they carried on their work.

Luck did play its part in the expedition, of course, and it is a matter of record that the most important find of the whole expedition "just happened." This was the finding of the dinosaur eggs. George Olsen, one of Mr. Andrews' assistants, went for a stroll one evening after the men had set their camp for the night, and seeing a small bluff-like depression walked in that direction. He looked down from the slight rise of ground, and saw something that looked extraordinary. He jumped down and examined the objects that had attracted his attention, growing more and more amazed as it dawned on him that he had made a discovery that was of the greatest value. He ran back to the camp and breathlessly told his story.

"We laughed and told him he was crazy," Mr. Andrews said in describing the incident. "No such a thing was possible, it was something unheard of, but we followed Olsen—and sure enough there were the eggs, lying just as they appear in the photograph. Others were found close by, some of them slightly



By special arrangement with the Third Asiatic Expedition of the American Museum of Natural History and Asia Magazine.
Dinosaur eggs, just as they were found on the Gobi Desert.

buried by the sand. When we examined the eggs we found skeletons of baby dinosaurs inside. While we are not sure, the eggs were probably laid in the sand, and covered over to hatch. Further investigation uncovered a fossilized skeleton of a dinosaur in the sand just above the place where the eggs were found. It may have been the skeleton of the very dinosaur that laid the eggs some eight or ten million years ago."

The finding of the dinosaur eggs might easily be termed the climax of the expedition, occurring as it did during the late summer of 1923. Previous to this discovery the expedition had unearthed seventy skulls of *Protoceratops,* an ancestor of the great frilled horned dinosaurs that once lived in America. The eggs are from this reptile. Also they found skeleton material of a semi-aquatic dinosaur, and the skull of the largest flesh-eating mammal ever known. This was a great hyena-like animal that was probably thirty feet long, and had a jaw spread of about two feet. In 1922, the first season in the field, Mr. Andrews discovered the skeleton of the largest vegetable-feeding animal, the Baluchitherium, which stood fourteen feet high, so that it was possible to make comparison between the flesh-eating and herb-eating creatures. Another discovery of vast importance was twelve skulls of an extinct family of huge beasts that had previously been discovered in South Dakota, and that constituted convincing evidence that a land bridge had once connected North America with Asia. This bridge probably existed as recently as 200,000 years ago, and over it wandered not only animals of ancient days, but also man.

As would be natural, there was plenty of adventure attached to the expedition.

"Our great concern, of course," said Mr. Andrews, in discussing the events of his work on the desert," was the fossils that we discovered. When they were finally ready for shipment back to the United States they weighed nine tons, and filled two hundred boxes. The greatest job was to get the fossil from the place of its discovery to the camp where it might be properly packed for shipment. As the camel caravan carried most of our packing materials, and as the caravan moved very slowly, there were often occasions when the packing of fossils was a ticklish job. On the occasion of our greatest find, that of the eggs, and the dinosaur that probably laid them, we had been away from our caravan for a long time, and were so completely out of any proper materials for packing that we were reduced to pasting up our specimens with anything that was handy. I had a priceless dinosaur skull pasted up in my best pajamas, and all my assistants, even the Chinese and Mongols we had hired, were down to one pair of socks and one suit of underwear each. One man had two pairs of pants, and he was forced to give up one.

"The slowness of the camel train really caused a certain amount of hardship," Mr. Andrews continued, "for there were occasions when calculations failed, and we were without necessities for days while the great beasts lumbered their slow way. Incidentally, it needs to be understood that the Gobi Desert is not a sand desert, such as the Sahara, but a rock desert, which made it easy for the automobiles. It is really a terrible place, with seven months of bitter cold weather, the temperature falling to fifty and sixty degrees below zero in winter. You can travel the desert for hundreds of miles without finding a tree; just rocks and plains.

"Our method of working was to select a camp-site and then prospect around it for a couple of hundred miles. This would take us five or six weeks, and in the meantime the camels with their supplies would be marching toward the place we had chosen as our next camping spot. When we had finished work in one place we would move, covering in a week the same ground the camels had covered in five.

"Our most trying adventure was when we decided that we wanted to revisit during our second season on the desert a place at which we had camped the first season, and where we had found the skull of a beast that was the ancestor of the frilled and horned dinosaur of America. This place was at the extreme end of the Altai Mountains, and separating us were four hundred miles of desert. We could get across it in our automobiles, all right, but because of the barren condition of the country we were not at all sure that the camels could make the trip.

By special arrangement with the Third Asiatic Expedition of the American Museum of Natural History and Asia Magazine.

It takes a camel caravan five weeks to go as far as an automobile can go in five days. Seventy-five camels carried gasoline and food supplies for five motor cars and twenty-six men of the Third Asiatic Expedition of the American Museum of Natural History and Asia Magazine. They are shown here reaching camp after a six-hundred mile march.

"However, we decided to take the chance. We took along enough food for a month, and enough gasoline to insure our arrival at the place. The camel caravan was to follow with food and gasoline for the return trip. The chance that we took proved to be worth all the discomfort that followed, for it was on this trip that we discovered the eggs.

"At the end of three weeks the camels had not arrived, and our food was getting low. Our fossil find had been so large, and so valuable, that we had not enough of the materials necessary for the preservation of the fossils. We used part of our flour and a great deal of our clothing in preserving the fossils. The method of preservation is to soak the fossil in gum arabic and make a paste of flour which you stick to the fossil with rice paper. It is typical of the spirit of the whole expedition that when we were down to the last bag of flour I asked the men if they wanted the flour saved for bread, or used to preserve the fossils, and they exclaimed: 'Let the work go on.'

"When our flour was gone we lived chiefly on tea and meat, the meat being furnished by the antelopes, which live in thousands on the desert. One of our great sufferings was from a lack of sugar and salt.

"Finally the camels arrived, not all together, for the leaders of the caravan had found that forage was so scarce that the caravan separated. Also, one section of the train had to make a long detour because of the presence of a bandit troop. Several of the camels died on the way to the camp, and more on the return journey, so that when at the end of the summer of 1923 we left the desert we had lost thirty-six of our seventy-five camels.

"Of course there are always dangers accompanying any such expedition as the one I headed, which has become known as the Third Asiatic Expedition. One of these dangers was from the Mongolian viper, a small reptile, but a deadly one. It was always finding its way into our socks, sleeping bags, and clothing, but fortunately none of us was ever bitten. Another source of danger came from the savage packs of Mongolian dogs. These dogs are the fiercest brutes that I have ever known, probably the fiercest creatures on earth, and under my order no one was allowed to leave camp unarmed, for one of these dogs will attack a human being on sight. Incidentally, thousands of these dogs live on the outskirts of the Mongolian settlements, and they play a sickening part in the native burial custom, for instead of burying their dead in the earth the Mongolian places the body of the dead person in a cart, which is driven beyond the settlement over the rough ground, and allowed to jolt off, and so left to be eaten by the dogs. On three different occasions members of our party were attacked by the dogs. Professor Berky was attacked by three dogs, and would have been killed if he had not had his revolver handy. On another occasion I was asleep with my wife in our tent when I was awakened by a piercing shriek from my wife. A pack of dogs was circling about the tent, and a moment later one of them came dashing in. I seized my revolver and fired instinctively. Luckily I hit the leader of the dogs. Then I fired again and again, hitting three others and driving them off.

"Of course there is a great deal of work still to be done in the way of exploring Mongolia and the vast reaches of the Gobi Desert, and the expedition will begin fresh work next summer. What we have been able to establish clearly is the fact that Central Asia was the original home of animal life; that Asia, moreover, was "the mother of the continents," and that up to within possibly 200,000 years of the present time there existed a land bridge between Northern Asia and the Alaskan peninsula of North America.

"We have found no direct evidence yet on human evolution, but we have much evidence tending to prove that Central Asia was the cradle of the human race, and our search will be continued to find the fossil remains of the ancestral forms of man's remote predecessors.

"While fossils of dinosaurs and other extinct species of reptiles are discovered in Europe and America, they are not the early ancestral forms such as our expeditions have unearthed in the hitherto unexplored regions of the Gobi Desert. These reptiles did not migrate to the newer continents until their species were well developed."

Mr. Andrews summed up the reason Asiatic expeditions have not come upon any "missing links" by saying that the rich and ancient fossil beds were discovered first, and that they had to be explored thoroughly before the work could turn toward other areas that might disclose fossils of man.

"We are confident that there are formations in Mongolia that will reveal the secret of man's earliest origin, and these formations we expect to uncover when we get into the desert again."

Are Ball Players Worth What's Paid for Them?

Concluded from page 10

players. The most sensational was, of course, Hans Wagner. He was likewise the greatest. Hughie Jennings, who came before Wagner, was another flashy performer, an exceptional showman. Jennings later on managed the Detroit Americans and he was the most spectacular manager either big league ever had.

Among the modern shortstops, Donie Bush, of Detroit, was one of the finest showmen. Bush was short and squat. Built low to the ground he had a flashy style and he was always an idol on the American League circuit. Bush was an intelligent ball player and the hardest man in the league to pitch to for at bat he had a peculiar crouch which pitchers found an almost impossible handicap in trying to pitch strikes to Bush. He got more bases on balls than anybody in the league.

"Rabbit" Maranville was the best showman among the shortstops of the National League. Maranville had an odd way of catching a fly ball. He cupped his hands and held them against his chest, catching the ball much as a football player catches a punted ball. This style alone made Maranville a marked individual and a drawing card.

"Buck" Weaver was the best showman the American League had among her third basemen until Joe Dugan came along. Weaver was even more sensational than Dugan. In the National League "Pi" Traynor, of Pittsburgh, is the most spectacular among the third basemen now in the game.

There have been some crack showmen among the pitchers. Cy Young was one, "Rube" Waddell was another. Both "cards" and each a great pitcher. Then there were "Bugs" Raymond and "Rube" Marquard.

Among the catchers Ray Schalk, of Chicago, for years the best catcher in the American League, was also the flashiest. Schalk was always a good showman.

Some of the greatest players of all time have worked along the lines of Kamm. They were anything but sensational. They were not showmen but stylists. They had form. While great, they did not have the magnetism that their showier brethren carried and lacking the magnetism they did not furnish the drawing power that the showman does.

Had not George Sisler lost his full sight he probably would have gone down as the greatest first baseman of all time. Sisler was the best batsman in either major league when forced out of the game. He was foremost among base-runners. As a fielder he ranked second only to Chase. And still, Sisler as a fielder, batter and baserunner, was a stylist. He had form. He played in the strictest sense of form.

Larry Lajoie was the best infielder of all time, considering form. Lajoie was probably the best second baseman the game has produced. Lajoie was the "poetry of motion" on a ball field. He had style, perfect style. No second baseman has quite equaled him in fielding and few natural batters of the power of Lajoie have been produced. He is one of the greatest four batsmen of all time.

Edward Trowbridge Collins, probably the best among recent second basemen, is another stylist.

Among the shortfielders of recent years Bancroft, of the New York Nationals, and now manager of the Boston Nationals, was the leading shortstop in the old league and Everett Scott, of Philadelphia, Boston and New York, the best in the American League. Both were stylists. Gerber, of the St. Louis Americans, who has replaced Scott as the leading shortstop of his league, is also strictly a stylist.

Kamm is the best stylist among the third basemen of today.

In the outfield Tris Speaker has for several years been the best stylist in either major league. Speaker must be regarded as one of the greatest outfielders of all time, and he is probably the greatest fielder. He was never a showman but he had wonderful form. Speaker was to the outfield what Lajoie was to the infield.

Among the catchers "Si" Perkins, of the Philadelphia Americans, is the best stylist among modern-day catchers. Connie Mack, the Philadelphia manager and a catcher in his day, says that Perkins is the greatest stylist the game ever produced behind the plate.

To go beyond these players one can recall Fred Tenney, a great first baseman and a stylist. Frank LeRoy Chance was more of a stylist than a showman and Chance also played first base. Jimmy Collins was the best stylist seen at third before the arrival of Kamm and in the outfield "Wee Willie" Keeler was the best before Speaker. Besides being one of the best fielders of all time Keeler was the greatest place hitter the game has known.

Among pitchers the greatest stylist of all time was Christy Mathewson. Every pitcher, if he studies his work, tries to be as near like Mathewson as possible. Walter Johnson, who pitched the fastest fast ball the game has produced, was also a stylist. Johnson always had admirable pitching form. Grover Cleveland Alexander is another great pitcher who was always a stylist.

And, while speaking of pitchers, Babe Ruth cannot be overlooked, As an outfielder Ruth is one of the most spectacular showmen of all time but Ruth was not always an outfielder. He used to be a pitcher, a left-hander, on Boston's champion team. And Ruth was one of the best left-handers that ever stepped on an American League pitching rubber. As a pitcher Ruth was never a showman; he was always a stylist. Ruth had almost perfect pitching form. If Ruth had not shown such tremendous slugging powers he would still be pitching and if he were, the game would have in him an excellent form pitcher instead of the best drawing card in the game today.

This is not meant to be a complete discussion of the players of all time. Many have been neglected, because of lack of space. No mention has been made in foregoing paragraphs of Frankie Frisch, of the New York Nationals. We believe Frisch to be the greatest player in the game today and he is, above all, a showman. He is the only player in the big leagues who slides hands first, and this is contrary to all style and form; but violating form as he does, Frisch is still probably the best base-runner in the majors. He is also one of the best batsmen in the game and an intelligent performer.

Neither have we mentioned Heinie Groh, of the same team, a sensational infielder and a natural showman; Harry Heilmann, the best right-handed batsman of the day, a good outfielder and a spectacular player; Harry Hooper, a great outfielder and a stylist; Ed. Delahanty, one of the great sluggers of the past and a showman. These, and many more, were omitted. We simply used a few players to illustrate our point, or attempt to illustrate it. We want to show that there is no such thing as a definite value of ball players and that some of the greatest have failed to draw nearly as many people through the gates as some of less ability, and why.

Co-ops Break Grip of Price-fixing in Sweden

Consumers Find That Societies Can End Control of Middleman; Farmers Divide Country Into Districts, Overcome Difficulties

By HUSTON THOMPSON

"IN QUEST of the Co-operative" in Sweden, I entered from the south by way of Malmö. Coming from the shores of Denmark, we passed Elsinor Castle, of Shakespearean fame, in the dusk. We were carrying with us the deep impression made by the success of the agricultural co-operatives of that country.

As there was a national fair being held at Gothenburg, to the north and on the west coast, we did not stop longer than to observe that the southern part of Sweden, known as the Skane, is very fertile and capable, generally speaking, of producing most of the farm products that are needed in Sweden.

The Gothenburg fair was remarkable in that it gave, both in pictorial and physical portrayal, the rise and growth of the industries and arts of Sweden in such a way that a study of the exhibits revealed a veritable school of historical and practical knowledge. I could not but reflect, after passing through hall after hall containing almost every conceivable manufactured article in use in modern civilization, that if Sweden and the other countries that I visited continued to grow in economic independence, the exports of the United States would suffer.

The Consumers' Co-ops

STROLLING down the main thoroughfare I saw a crowd around a window display. With some effort I wedged my way close enough in to discern what was drawing and holding the crowd. A young lady was turning the pages of an enormous chart or book, displaying on the pages diagrams, pictographs and drawings that revealed the rise and growth of the Consumers' Co-operative movement in Sweden. A great deal of time and thought must have been spent on this device, for the authors had so simplified the story that its unfolding tale could be grasped at a glance. The story had an evident lure for the populace, for the crowd before the window was one of the largest and most persistent that I encountered at the fair.

From Gothenburg, we set out for Stockholm, on the extreme east coast of Sweden. One could easily imagine himself in the territory along the border line of Northern Minnesota and Canada known as the Rainy Lake Region. There was vista after vista of beautiful scenic lakes, surrounded by dense forests, and then suddenly came an opening of a few hundred acres where some farmer had made a clearing for his crops.

The country through which we traveled northward has become one of the greatest centers of wood pulp and lumber production in Europe. Its soil is, however, too rocky for a high state of agricultural cultivation, such as one finds in the southern part of Sweden.

Stockholm is, of course, the center of both the Swedish Consumers' Co-operative urban movement and of the agricultural co-operative organizations of the farmer, though there are large distributing depots in Gothenburg, Malmö and other points.

Sweden, in conjunction with Norway, Denmark and the other Scandinavian countries, has made a distinct contribution in the realm of co-operation. They have an international buying union through which the co-operatives of all three countries purchase such articles as tea, pepper, and coffee, and they have offices located in London for this purpose.

The history of co-operation in Sweden reveals a clear-cut fight against price-fixers and monopolies. It is well to point out here that in Sweden, as well as in the other countries that I visited, when the ultimate consumers arose in their wrath and formed co-operative societies to fight the middleman who was fixing prices, or the monopoly, they frequently stumbled at first. But they never failed eventually to defeat the other fellow who stood in their path. Such an experience of the foreign monopolist foreshadows what will inevitably come to the American price-fixer, or trust, if the prices in our markets do not come down and if there is a large enough group of people who have been sufficiently injured by their machinations.

Middleman Beaten First

I PUT the question frequently in Sweden as to how the co-operator could defeat a trust or combination that had acquired most of the raw material in sight. Their answer was that first of all they would combine their efforts against the middleman. When they had eliminated him, they would take on a fight with the controller of raw materials. They did not believe, however, that there was such a thing as an absolute control of the ordinary raw materials.

For example, they argued that in the case of the manufacturer of shoes, if a combination controlled the market against the ultimate consumer, it was not at all difficult to buy leather in other markets and it would be possible, if necessary, to arrange for all their leather from co-operatives. The manufacturer of shoes who would monopolize the market, in their estimation, presented no great trouble, as co-operators in England, Switzerland and other countries had already demonstrated that he could be met and conquered. Evidently they have thought through the process of meeting monopoly. I believe that within the next fifteen years, the ultimate consumer of Europe, at least among the working classes, will make the price-fixer and the monopolist know what he is "up against" and that he has been in a battle.

As every successful co-operative movement is brought to the surface because of some pressing economic cause, such as price-fixing on the part of the distributors, so the gun of the housekeeper or ultimate consumer which fires back has the trigger pulled by some person who arises for the occasion, often from sources unexpected. In Sweden the co-operative movement had been going on in a desultory way until a Mr. Sundell appeared on the scene and became the second secretary of the Consumers' Co-operative organization. He had been a printer by trade and hailed from a town in the center of Sweden where he had first-hand experience with profiteers and monopolists. With his advent, things began to move. Through the columns of the co-operative newspaper, Sundell called the co-operatives to battle. He was a persistent fighter with a splendid sense for publicity, and above all a warm friend of the poor and oppressed.

It was not long until his work produced victory. When he died in 1910, he was looked upon as the real leader of the Consumers' Co-operatives in Sweden.

This movement has a large wholesale plant in Stockholm and in connection with it runs a savings bank where it accepts money on deposit. It also owns its own slaughterhouse. In Stockholm it is building a bakery. It has eighty-four stores with an annual turnover of fifteen million kroners (the value of the kroner at present is about twenty cents) and its membership amounts to from fifteen to eighteen thousand.

This organization also conducts a correspondence school with three thousand members studying many subjects, among which are bookkeeping, arithmetic, political economy, commercial law, banking, business correspondence, grammar, Swedish language, literature, public speaking, and social and alcoholic reform.

Two Papers Published

THEY publish two newspapers, one a weekly and the other a biweekly. They assert that they have become so strong that the deflation of Sweden, which as far as I am able to judge is the one country in the world where deflation has actually taken place, did not hurt them appreciably. They give as proof of this statement that in 1904 they were doing a business of 276,000 kroners and in 1922 a business of 63,000,000 kroners.

As in England I found a marked indifference on the part of the Consumers' Co-operatives in regard to the success or fate of the farmers' co-operatives. The latter have had some great difficulties to surmount. One blow that they received was brought about by the failure of their bank. Nevertheless, the farmers have made great strides forward.

These farmers' organizations, like those in Ireland, not only sell the products of their members, but also act as a buying organization for practically all the necessaries used in producing a crop. They are the largest fertilizer buyers in Sweden. They purchased nitrates from Chile and oil cakes from the United States. In fact, they are one of the largest purchasers of feed stuffs in the United States. They sell the farmers' rye, wheat and oats to the mills in Sweden, and where there is an excess of oats they export the same for the farmer. Some of them handle butter, eggs, hay and cheese for the farmer. But all imports are made through the national association.

It is well to pause for a moment and study the administrative system of the farmers' co-operatives of Sweden, for they have handled quite successfully the greatest problem that confronts the co-operative, namely, size. To do this they divided Sweden into regions or zones. In each of these regions, there is a central society that acts as the distributor of the farmers' products, and buys his seed and fertilizer for him. The central society of the Skane, the southern part of Sweden, has eliminated the middleman by buying coal for the members of its association. Not unless there is some catastrophe or impending matter that is so great that the regional society cannot handle it, do the local or regional associations call upon the national organization, with which all of these regional societies are connected. When such an occasion does occur, they send out the SOS call and the great central society sets its machinery in motion and takes over the whole matter.

The farmers' co-operatives claim that Stockholm has the largest milk consumption per capita in the world, and that the central co-operative milk society to whom the farmers sell their milk distributes eighty per cent of Stockholm's requirements.

Mr. Benzinger, the present head of this co-operative, was once a competitor of the farmers, operating a very large dairy in the city of Stockholm. In 1915, he offered a plan to the co-operatives whereby his plant and several other large independent milk dealers would consolidate and merge with the farmers, becoming their distributor. The plan was accepted, and Mr. Benzinger was made director. His plant was made the nucleus of the present mammoth milk establishment located in Stockholm. It centers around a group of modern buildings, easily available to every part of the metropolis.

There we saw five hundred thousand liters of milk handled daily, of which 155,000 gallons were distributed in Stockholm. To do this, the most up-to-date machinery is being used and business ability of the very highest order is seen in every department. As we went through the plant and observed the whole milky way carried along by modern machinery with the utmost care for cleanliness, one could not refrain from complimenting this great farmers' organization.

Their method of filling the bottles automatically and covering them with a metal top without permitting the milk to come in contact with the employes' hands, and further providing, upon delivery, that the bottles may be opened without the thumb touching the rim of the bottle, excited my interest to the point of exclamation. "Yes," said the director, "we study all your American methods and adopt the best. You lead the world in the use of automatic machinery.

"I have been studying your catalogs," and here he showed me a number of the catalogs of our milk appliance manufacturers, "and, this autumn, I am going over to the United States to the Milk Co-operative Conference which is to be held in Washington. On this visit I will take a trip through your country and spend a month investigating your dairies and latest machinery, and if I find any improvements you may be sure that our co-operative will have them."

An Up-to-date Laboratory

THE laboratory of this organization is one of the most up-to-date in the world, and has so demonstrated its usefulness that the government, in its study of the milk question, works in conjunction with the employes of this laboratory.

So modern is this plant that it is almost independent of outside sources in its requirements. It has a blacksmith shop, saddlery, machine shop, carpenter shop, paint shop and makes the boxes in which they place the bottled milk. It also keeps all of its wagons, automobiles and machinery in repair in its own plant.

Most of the surplus milk is turned into butter. The organization goes so far as to import directly Bulgarian bacteria cultures for the purpose of making Bulgarian buttermilk, which is prescribed in quantities by physicians of Stockholm.

It operates many retail milk shops throughout Stockholm from which it distributes its products.

When I inquired as to whether their employes were satisfied, they informed me that they had never had a strike, nor so far as they knew was there any restlessness or irritation among the employes, all of whom looked well-fed and happy.

It struck me that a co-operative such as this, which was handling the sale of all the farmers' milk, was in such close touch with him and had such large storage capacity in Stockholm, could easily handle some of his farm necessities. I asked why this was not done. The reply was that it would not be good business to act as buying agent for the farmer. The job of handling eighty per cent of the milk used in Stockholm, manufacturing butter, and making cheese, was a sufficient task for any one group of men, and they had found it wise to tend strictly to a single line of business.

No Aid From Government

AGAIN I put the question which I asked in every country visited, whether the farmers' organization desired assistance from the government. The answer was an emphatic no, and, in a similar vein to that of most co-operatives, that they would limit the government's efforts to teaching and encouraging co-operation, but would never submit to being subsidized. As they expressed it, changing administrations might look upon the co-operative movement from differing angles. If the society were receiving a subsidy, undoubtedly an incoming administration would interfere with the conduct of its business to the point where it would be a very disturbing factor and might prove fatal to the success of co-operation.

The complexion of economic life in Sweden has been changing very rapidly, though it is not yet as industrialized as in Germany, Belgium or our own country. During the last quarter of a century the industrial workers have increased from one-fourth to more than one-half, so that now approximately fifty-two per cent of the Swedish people are engaged in manufacturing occupations. This would indicate an additional growth in the Consumers' Co-operative societies, for they flourish in industrial communities. On the other hand, it is significant that only about a fourth of the people live in towns or cities, a great proportion living in rural districts. Among these are the thousands of men occupied in the lumber and wood pulp industries.

As Sweden has a very excellent school system and has entirely eliminated illiteracy, she has a strong background for the co-operative movement. Added to this, her people are practically of a single race, with the exception of those in the far northern territory. The situation seems ideal as long as monopoly is sufficiently grasping to force the ultimate consumer to meet it with combined effort.

President, Ramsey Institute of Technology, St. Paul, Minnesota.

Neuropsychiatry and the Disorders of Speech

SPEECH is the result of a long and continuous development from simple characteristic sounds made by the organs of speech and representative of feelings, perceptions, and ideas. At no time in the evolution of man do we find the elements of speech entirely lacking. The genesis of speech is veiled in primitive experience. It is difficult to reason from present processes to past beginnings. This method, however, is far safer than many of the conjectures which have been made concerning the origin of language.

Dr. F. N. Scott has made a notable attempt, by using this method of reasoning, to formulate a connection between various speech movements and their related experience conditions. In his work, "Publications of the Modern Language Association of America," he pointed out the fact that it is highly probable that typical natural movements of the speech organs have been inevitably associated with the particular experience situations which accompany them. Scott mentions such speech movements as grunting, gasping, choking, coughing, panting and sneezing. It is a well-known fact that the opening from the *pharynx* into the *larynx*, designated as the *glottis*, closes before all great exertions by the muscles of the body. All violent exercise is followed by panting. It is a psychophysical law that associated activities leave more or less enduring traces by which the experience events may be recalled in memory. In accordance with this law the speech movements would become definitely associated with the corresponding sounds and also with the particular experience situation which existed at the time.

The nervous system is an important factor in many of these associations. In cases where the feeling is intense the "overflow" of the emotional stress results in secondary movements which may be noted in either the vocal organs or in other muscles of the body. In many instances both the vocal organs and the bodily muscles are influenced by the "overflow."

The theory of Dr. Scott is in harmony and, in fact, emphasizes the validity of the supposition that language, consisting of expressive movements, developed simultaneously with thought or intellectual life.

Certain sound-producing vocal movements may be said to be instinctive in origin. Such sounds typify the presence of "food," "danger," and so forth, and are distinctly important in the service and preservation of life.

Language or speech is not a simple process. On the contrary, it is a complex of physical, muscular, and nervous processes. When we give audible expression to our thoughts a nervous process or activity is initiated in a portion ("motor area") of the brain which controls those particular muscles which, by their peculiar motion, produce the definite sound which represents the idea present in consciousness. This nerve-cell activity is thought to be of a chemical and electrical nature. This brain-cell activity is transmitted to the muscle cells where chemical and electrical action also take place, resulting in that shortening and thickening of the muscles which produce movement. The bones and other tissues are also set into motion by this muscular effort. In speech almost all the muscles from the hips to the ears are used to some extent. Musical tones and consonantal noises are controlled by muscles in the head and neck which move the tongue, jaw, and lips. The physical part of the process consists in the resulting vibrations of the air particles of the breath which are propagated to the eardrum. Passing into the inner ear this vibratory stimulus influences the proper organs of sense, ultimately reaching the termini of the auditory nerves. From these nerves the influence is transmitted to the brain with the result that the sensation of sound appears. The audible message calls forth thoughts and emotions in the mind of the hearer which, of course, are never identical with those of the speaker but suggest replicas, tinged, as it were, by the conscious "atmosphere" of the recipient.

Correct pronunciation is possible because mispronunciations leave their historic record in the sensory nerve organizations which are associated with those muscles which are active in the production of speech. By this marvel of adaptability the kinesthetic sensations (sense of muscular effort) are developed. Sensory nerves are found in the facial surface, the lips, gums, palate, tongue and in the synovial membranes of the joints. When we speak, the involved muscular movements exert frictional pressure upon these sensory nerves which are thereby stimulated. The result is a feeling of pressure, touch, and strain by which the consciousness of the extent, nature, and location of the involved muscular movements arises. This peculiar awareness is a fundamental in kinesthetic sensation. In conjunction with the auditory sensations the kinesthetic awareness enables us to repeat those movements which we learned in infancy. By this means we are enabled to correct errors in pronunciation (that is, errors in muscular movements), and this remarkably complex mechanism constitutes the instrument by which our movements are controlled.

Through complex associations between word-sounds, their meanings, kinesthetic sensations, visual sensations of the printed words, and the ideas which they represent, that sympathetic weld has been produced which we designate as language or speech. This harmonious structure is composed principally of muscular movements, word-sounds, and printed or written symbols of words.

PROFESSOR SMILEY BLANTON, M. D.,

One of America's foremost specialists in Neuropsychiatry, whose invaluable researches constitute a marked advance in a difficult and highly important field of knowledge.

This wonderful system is a fundamental means of self-realization, through co-operation in the social environment. Language or speech is not only our means of communication but it is also the balance in which success and failure are measured.

More detailed discussions of this subject may be found in many works on physiological psychology. This brief synopsis of the essential facts has been made because of its bearing on the following discussion of the problem of speech disorders. If we are familiar with the development and factors involved in the process of speech we are better equipped to consider the causes which underlie the various observed disorders.

From the facts already presented it should be evident that speech disorders are not due solely to abnormalities of a purely organic nature. Speech, as we have seen, involves us in the complex social fabric. Through language we become aware of the extent of our successes and failures. It is the great instrument of self-realization. Speech is a psychophysical problem. In fact this problem involves the mental attitude and the social environment to a greater extent than the purely organic mechanism of speech. When we consider the disorders of speech, we are principally in the field of nervous and mental abnormalities and we must look, in a great measure, to Neuropsychiatry for a solution of the problem. Unfortunately, in the United States, there are, perhaps, not more than half a dozen physicians who are specialists in this important field. In the forefront of this small group of earnest investigators we find Dr. Smiley Blanton, professor of speech hygiene and Neuropsychiatry at the University of Wisconsin Medical School. As attending specialist at the speech clinic of the United States Public Health Service Hospital No. 37, Dr. Blanton had excellent opportunities for careful research work in the field of speech disorders. Some of his conclusions are stated in his important contribution entitled, "The Medical Significance of the Disorders of Speech" (Transactions of the American Medical Association, June, 1921).

In this work Professor Blanton states that the development of the "speech area" in the brain depends upon "an intact auditory apparatus, the presence of intelligence, and an intact nervous and muscle system" in an environment which provides "certain emotional and social demands and situations." It is under the stimulus of such an environment that the "speech area" is organized. In this particular article he does not deal with the impairment of the use or understanding of language due to injury or disease of the brain (*aphasia*). He does, however, consider the following "four tentative groups: (1) delayed speech; (2) letter substitution; (3) oral inactivities of the articulatory organs, and (4) stuttering, which includes the disorder of stammering." Dr. Blanton regards these four groups not as diseases but as symptoms of disharmonious and unadjusted experience conditions. These disorders may also indicate abnormalities and defects in those organs and muscular mechanisms which function in the process of speech. His conclusions concerning the proper treatment of these cases are drawn from the intensive study of numerous post-war sufferers from speech disorders, student groups, school children, and private patients. We quote, in full, the following summary of the results of his researches: "We believe the disorders of speech to be due to the lack of ability to adapt emotionally to social situations, or to a faulty motor mechanism, either hereditary or acquired. We believe that the most worthwhile results which are obtained at present are those which aim at the underlying cause and general hygiene, and muscle training; and that training aimed at the alleviation of the symptom alone is pernicious because it obscures the issue and in hysterical cases actually "sets" the disorder.

We feel that this problem, for so many years left in the hands of quacks and charlatans and untrained people, is most distinctly a medical problem, and that neuropsychiatric training is necessary for the diagnosis and treatment of these patients."

The address before the Milwaukee Neuropsychiatric Society, delivered March 23, 1922, by Dr. Blanton, is effectively paraphrased in simple and nontechnical language. This paper is so highly important to general welfare and the common good that it should be carefully studied not only by all teachers and educators but also by the general public. We can render no better service than by making verbatim quotations from portions of this significant contribution.

"Much of the rage and temper shown by the deaf and by those children with normal intelligence, but with delayed and imperfect speech, is caused by their inability to find emotional outlets through speech. Every emotion registers itself through changes of muscle tension in the speech mechanism. The diaphragm may be said to be the safety valve of the body; through giggling, crying, screaming, laughing and speech the emotional tensions are siphoned off."

"Not only is speech a short-cut to action and one of the most effective outlets of the emotional life, but it is the chief medium through which the intellectual life is developed. Speech is not instinctive; it is a definite learning process. It develops in response to environmental needs. This environmental urge is needed by all children, but it is especially needed for the neurotic, unstable child. If there is no need to develop this short-cut to action through speech, it may be delayed long past the time for the normal acquisition of speech. The very fine co-ordinations of speech require an intact nervous system."

"Oral surgeons and laryngologists see a great many speech disorders that are due to abnormalities in the peripheral organs, such as cleft palate, malformed arch, poor occlusion, and so forth, such cases naturally going to those who specialize in this field. When, however, we study an unselected series of speech disorders in adults and in children, we find that perhaps not more than ten or fifteen per cent are caused by abnormalities in the peripheral organs. The rest are due to functional causes. A study of these causes takes us into the realm of psychology and of psychiatry."

Dr. Blanton considers speech disorders "occurring in soldiers who had nervous breakdowns."

"The primary object in treating these cases," he states, "is to re-educate them so that they can go back and take their places in the world; the training of the speech mechanism is a secondary factor. The re-education of the personality is the primary thing. The stuttering is only a symptom of the anxiety, fears, and lack of emotional poise."

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

The president of the Berlin Jewish Community, Herr Stern, belongs to the Liberal party. The vice-president, Dr. Klee, belongs to the Zionist party, and a second vice-president, Herr Levinsky, belongs to the Conservative party. In this way political Germany is kept under surveillance.

Of 434 members of the House of Representatives, 373 confess religious affiliations. Of the ninety-six Senators, seventy-six are church members. The religious complexion of Congress as a whole is as follows: Methodist, 119; Episcopalian, seventy-four; Presbyterian, seventy-three; Baptist, forty-eight; Catholic, forty-five; Congregationalist, thirty-one; Disciples of Christ, seventeen; Lutheran, fourteen; Jewish, nine; Unitarian, five; Dutch Reformed, three; Mormon, three; Quaker, three. And of the United Brethren, Mennonites, Christian Scientists, Universalists, Evangelical Church, one each.

The tax paid by every American family amounts to one dollar for every working day, according to a banking authority.

The United States is the most neurotic country in the world, with Britain a close second, according to a Cambridge University professor. He stated that anyone who smokes twenty cigarets a day puts five per cent of his blood out of play.

Nearly 6,667,000 bales of cotton were used in this country during 1922-23.

A Swedish chemical engineer makes a thick fog with a two-foot machine which spreads smoke blankets over orchards, gardens and fields to prevent damage by frost.

Michigan planted 27,000,000 brook trout last year.

The founder of psycho-analysis and the more prominent exponents of the theory are Jews. Which leads the Jewish *Sentinel* somewhat prematurely to say: "It is thus very significant that salvation for human ailments is coming not from Mrs. Eddy, the Protestant, nor from M. Coué, the Catholic, but from Freud, the Jew."

Benjamin Franklin is the only American in a list of the eighteen greatest men contributing to learning in the history of the world, as compiled by the University of Washington faculty.

An oddly shaped gold ring, believed to be part of a pirate's treasure loot, was found by a New Haven, Connecticut, fireman digging clams in the sand near Thimble Islands in Long Island Sound. The ring is composed of four bands, joined by clasped hands.

A bronze mirror dating from Caesar's invasion of Britain has been found in the forest depths of the Celtic encampment. It was presented to the British Museum.

For the first time in many years a liner, the *Oropesa,* put to sea from Liverpool with the crew and passengers "chantey" singing "Down to Rio" as in the old days of the sailing lugger. During the 19,000-mile trip chanteys will be sung.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Uruguay plans to utilize the waters of the Río Negro to generate electric power for Montevideo and near-by towns.

Progress in the form of a larger Fort Wayne, Indiana, threatens the grave of "Johnny Appleseed" (John Chapman). With a leather bag filled with apple seeds, which he had gathered from cider presses in the more prosperous settlements of the East, he passed through Ohio and Indiana planting his seeds wherever he could find a cleared spot. Archer burying ground may be made into a public park or shrine if sufficient pressure is brought to bear on the city of Fort Wayne.

A torpedo-shaped piece of cast steel, weighing 150 pounds with two handles welded to its sides, is used by the Los Angeles police department to break into lottery dens and gambling clubs. Four men swing the heavy metal bar against the door and whether wood or metal it soon gives way.

Mrs. R. E. Barrett, believed to be the only woman city manager in America, conducts the affairs of Warrenton, Oregon.

Tests prove that the human voice can be transmitted clearly only when the speaker's mouth is close to the transmitter. To speak four inches from the instrument is equivalent to lengthening the line more than 200 miles; two inches away, 128 miles. Lower-pitched tones are transmitted better than those of a high pitch.

To create a French atmosphere in a corner of a New England campus, Middlebury College will erect a French chateau to house the Department of French.

Five hundred small farms were auctioned off recently in Arkansas at a Federal receiver's sale to satisfy tax assessments levied against the land for the construction of highways.

A French aviator established a new record for hydroplane speed when he averaged 76 miles an hour over the Seine.

Newspaper prices in Paris have been increased one sou due to the increased cost of production.

Airships equipped with skiis instead of wheels for taking off and landing on the snow are seen in the mountain districts of Switzerland.

A new tone-sensitive safe lock that opens only to a tuning fork tuned to the required pitch is on view in Birmingham, England, according to reports from that city.

In ten years Florida's wealth has increased 162.9 per cent.

The only known supply of helium gas in the British Empire exists in Alberta, where 10,000,000 feet is going to waste annually.

Bernard M. Baruch, who says he was "the greatest man in the war," delivered what is described as "his annual lecture" at the United States Army War College, Washington, in which he described his system for conscripting men, money and industry in the next war. Barney Baruch is the Jewish speculator from Wall Street whom Woodrow Wilson set over the War Industries Board.

A Detroit judge fined three young men $5 and costs with an alternative of 10 days in the House of Correction for reading subtitles aloud in a picture theater.

Engineers estimate that five billion five hundred million cubic feet of water will be stored in the reservoir to be built by the Canadian Government through the Running Streams Commission on the Riviere du Loup, north of Louiseville in the St. Maurice district of Quebec.

Fish flour manufactured in France is made from the non-edible fish found in the nets of trawlers. It is mixed with feed for poultry, rabbits, dogs, sheep, cattle and hogs.

Although less than thirty per cent of the total, the farm population of the United States is carrying more than thirty-five per cent of the child population. The farm educates this excess of youth and turns it over to the cities at the producing age.

The best cane suitable for making saxophone reeds is grown near Marseilles, France. The cane is bought by reed instrument makers and matured by them for about two years before using.

A pair of well-trained homing pigeons will accompany each outgoing tourist car visiting the little-known parts of Colorado about Grand Canyon National Park. These pigeons will be used in case of emergency, since there is no telephone or telegraph service in that part of the country.

DOES THIS MEAN ANYTHING TO YOU?

One of our subscribers—a leader in his community—writes:

"Before I began reading THE DEARBORN INDEPENDENT I was prejudiced against it from comments I had seen in other publications, but now I consider it one of the cleanest and best publications of its class. It does as it is evidently intended to do—place before the general public a lot of valuable information in an admirable manner so that the average reader can get it."

Do Bolshevists "Use" Our Women's Clubs?

Amazing Account of How Propaganda Is Spread Thro' American Organizations

Exploitation of Our Cut-over Lands

China's Wise Patriarchs of the Soil

Colored Glass Now Cures All Our Ills

Being the Interesting Story of How One Parsee Gentleman Makes a Living

CHRONICLER OF THE NEGLECTED TRUTH

Are Women's Clubs "Used" by Bolshevists?

Interlocking Directorates Used Effectively to Disseminate Propaganda

By An American Citizen

GRAVE danger threatens the progress of organized womanhood in the world today. Leadership of women's organizations has fallen into the hands of radicals to an alarming extent. There is a conspicuous turning away from public work on the part of many able women who have formerly been active. Radical leadership may cost all that sane, progressive women have achieved through the centuries. It is inevitable that if a choice is compelled between the extreme feminist program under its present radical leadership and anti-feminist programs, the anti-feminists will win, since this is obviously the lesser of two evils.

One reason for many of our best women refusing to be candidates for office in women's organizations is that the advent of suffrage makes every organized unit a potential political factor.

To understand this it is necessary to examine the radical program for the control of leadership Tracing the personnel through the network of interlocking directorates which control women's organizations, national and international, we see how the radical works It is never the policy of the leaders to permit the rank and file of the members to know what the ultimate objective is. Women are drawn in through all sorts of camouflage interests—their dislike of war, their sympathies for prisoners, most of all by the frothy eloquence which depicts a woman's crusade against all evil, while at the same time their leaders are using the rawest form of political bludgeoning on politicians in the capitals, and are often in communication with the fountains of "red propaganda" in this and other countries. Of course, the good women who make up the rank and file are not supposed to know this.

Used for Red Purposes?

ON AUGUST 1, 1922, the Central Executive of the Communist International (Communist leaders who rule Soviet Russia) issued a signed proclamation "To the Central Committee of all Communist Parties," through the Communist "International Press Correspondence" service, in part, as follows:

"It is self-evident that the Proletarian United Front is not complete unless women are conscious and active co-militants . . . . It is the duty of the Communist parties of all countries to make full use of the existing possibilities to convert women into conscious militants . . . See to it that the necessary measures be taken for carrying on Communist propaganda among the broad masses of women . . . . that steps be taken for the awakening and mobilization of the working women to take their places consciously and confidently in the United Proletarian Front . . . . This applies not merely to political work . . . . but more particularly . . . . in the trade unions and co-operatives. The Proletarian women . . . [illegible] deep and potent sources of vigorous fighting power and fighting energy . . . . To unlock these sources will be the duty and honor of the Communist parties of all countries and will serve as another guaranty for the success of the United Proletarian Front in the struggle against the bourgeoisie."

This order from Moscow illustrates the true objective of the Communists regarding work in women's organizations. Some intelligent women are now convinced that the legislative program being sponsored by women's organizations is a menace and that the women of America are being used for a purpose that is concealed from them.

The National Council of Women which held its biennial convention in November, 1923 at Decatur, Illinois, is the clearing house for national organizations. The constituent organizations are as follows:

- National American Woman Suffrage Association, now National League of Women Voters.
- National Women's Relief Society.
- Young Ladies' National Mutual Improvement Society.
- National Women's Relief Corps.
- National Council Jewish Women
- National Florence Crittenton Mission
- Ladies of the Maccabees.
- National Federation of Colored Women
- Ladies of the Grand Army of the Republic
- Association of Collegiate Alumnae, now American Association of University Women.
- National Congress of Mothers and Parent-Teacher Association.
- National Federation of College Women.
- National Federation of Musical Clubs.
- Needlework Guild of America.
- General Federation of Women's Clubs.
- Women's International League for Peace and Freedom, U. S. A. Section.
- Women's Christian Temperance Union.
- Young Women's Christian Association.
- Woodmen Circle.
- National Women's Republican Association.
- Children of American Loyalty League.
- Kansas State Council.
- Rhode Island State Council.
- Indianapolis Local Council.
- Medical Women's National Association.
- International Sunshine Society.
- National American War Mothers.
- National Kindergarten Association.
- Sons of Veterans' Auxiliary.
- National Auxiliary United Spanish War Veterans.
- Association of Women in Public Health.
- May Wright Sewell State Association.
- American Legion Auxiliary.
- Osteopathic Women's National Association.
- Southern Women's Educational Alliance.
- American Lovers of Music.

The combined membership of these organizations is more than eleven million. The National Council of Women of the United States is affiliated with the International Council of Women of which the Marchioness of Aberdeen and Temair is president. The International Council federates all national organizations in Europe and the Orient. The combined membership of the International Council is approximately thirty-six million. These astounding figures by no means represent the total number of women who are being reached through the affiliated organizations which contact. Many women in the organizations not affiliated with the National and International Council of Women are members of the International Suffrage Alliance, the Trade Union Organizations and the National Women's Party, all of which are more or less infected with the radical communist or milder virus.

At the convention of the International Suffrage Alliance, held in Rome, May 23 of last year, the attempt was again made to amalgamate the International Suffrage Alliance and the International Council of Women. So far, this plan has failed of accomplishment, but its sponsors are by no means discouraged.

Through teamwork on interlocking directorates, a few key women dominate the legislative program in most of the women's organizations. This is the central fact which explains what is accomplished by any of these conventions.

The tendency to federate all organizations nationally and internationally makes it comparatively easy to control great numbers by small minorities. Take the National Council of Women as an example. There are fourteen committees, the membership of which is composed of the chairmen of like committees in the constituent organization. The representation of affiliated organizations in the National Council of Women is restricted to the president and five delegates. Members are welcome as visitors, but comparatively few attend the board meetings, as it takes both time and money to travel from one convention to another. The present officers in the National Council of Women have served through many years and there have been few changes in the chairmen of committees during the administration of Mrs. Philip North Moore, who was re-elected president for the fourth time at Decatur. Through means of these fairly continuous chairmanships the well-financed propaganda organizations are instructed to penetrate and control the women's organizations.

The two most conspicuous propaganda organizations affiliated with the National Council of Women are the National League of Women Voters and the Women's International League of Peace and Freedom. Mrs. Maud Wood Park, president of the National League of Women Voters, is a vice-president of the National Council of Women. Mrs. Park is said to have great influence over Mrs. Thomas G. Winter, president of the General Federation of Women's Clubs, herself a vice-president of the National Council of Women. The chairmen of the majority of committees in the National Council of Women are also members of either one or both of the above-mentioned organizations.

How Women's Bloc Works

ALL of the principal women's organizations maintain legislative representatives in Washington and the astute Mrs. Park some time ago organized what is known as the "Congressional Committee," of which she is chairman and of which Mrs. A. C. Watkins is secretary.

This "Women's Bloc," as it is called, can in co-operation with the radicals in Congress practically dictate our legislation, and our women, comprising the vast membership of these organizations, women who would quickly resent being called Socialists or Bolsheviki, are blithely passing resolutions and voting for a program that was inaugurated by Madam Alexandria Kollontay in her Soviet "Department of Child Welfare" in Russia.

The influence of many women is appreciable in the National Council of Women who do not personally attend these conventions. This comes because of their teamwork with the women who *do* attend. For example, Mrs. Raymond Robbins, formerly president of the National Women's Trade Union League, an organization which the Lusk Committee reports "adopted resolutions in favor of the Soviet government," and a contributor to the Rand School of Social Science where socialist leaders are trained, is one of the socialist women promoting pacifist and welfare propaganda. Miss Mary Anderson, chief of the United States Women's Bureau and chairman of the Industrial Relations Committee in the National Council, issued a call for a WORLD CONGRESS OF WORKING WOMEN, which met at Washington, November 6, 1919, and adopted the name International Federation of Working Women, of which Mrs. Robbins was made president. This congress gave special attention to "legislative reforms for the purpose of protecting maternity." The *Woman Citizen* magazine, the official organ of Mrs. Carrie Chapman Catt, reports that plans were recommended to secure state grants to mothers for each child born and to secure free medical, nursing and surgical care during maternity and, in addition, an allowance for the support of the mother and child during the maternity period." At the World Congress of Working Women they also advocated that there be organized an INTERNATIONAL LABOR OFFICE OF THE LEAGUE OF NATIONS BUREAU to collect information on best methods of maternity care.

The heart of everyone is touched by an appeal to care for mothers and babies. *The radicals find it easy to build their bureaucracy by selecting such obvious heart appeals* because by such means they sweep the uninformed to the polls unknowingly to vote away individual freedom and Constitutional Government. All students of political economy know that bureau management is costly and inefficient. Under the Sheppard-Towner bill each community must raise part of the funds for the care of its own mothers and babies. The Federal Government contributes a similar amount and assumes direction of the work. *Some day the community will awake to the fact that it would cost less to pay for the care of its maternity cases without Federal aid and under community direction. The great danger, however, is not the increased taxes due to the upbuilding of this undemocratic machine, but the centralized political control thus established.*

It was Mrs. Raymond Robbins who brought forth the idea of a department of public welfare in America. As a "republican" in co-operation with Mrs. Harriet Taylor Upton, of the National Republican Committee, she organized a welfare demonstration at Marion, Ohio, October 1, 1920, at which Mrs. Robbins was the first speaker and at which President Harding, then candidate, was persuaded to come out for a welfare department and a new cabinet officer. As chairman of the WOMEN AND INDUSTRY COMMITTEE OF THE NATIONAL LEAGUE OF WOMEN VOTERS, Mrs. Robbins wrote the "Women and Industry" and the "Education Plank" of the Democratic National Platform which is identical in wording with that of the League of Women Voters *long before their convention met.* It gives us food for thought when the leading women in both the Democratic and Republican parties are members of the League of Women Voters which organization is admittedly working for pacifism and internationalism and is sworn to uphold the non-partisan movement among women.

Tap Party Treasuries

RATHER clever of the women! They tap the treasuries of both the Democratic and Republican parties for funds with which to break down party machinery. Not long ago Mrs. Harriet Taylor Upton, of the Republican National Committee and Mrs. Emily Newell Blair, of the Democratic National Committee, made a lecture tour for the League of Women Voters, almost, if not quite, together. And a story of this trip was printed in a Sunday Washington paper with authenticated interviews from each, together with their photographs.

When we realize that this same program is being carried out by women in European countries as well, and that the program in our country is backed by these women who manipulate all of the committees from the great national political parties to the humblest church societies, and that they are lobbying for a program identical with that promulgated by Madam Alexandria Kollontay, the director of welfare in Soviet Russia, what are we to think? Madam Kollontay is so radical that even Radak himself objects to her, yet Miss Mary Anderson, head of the Women's Bureau in our Department of Labor, and chairman of Industrial Relations in the National Council of Women, has succeeded in having printed *by the Government of the United States* this program of Women and Children's Work minus only its Soviet label! Think of the network of club machinery represented by the National Council of Women and realize that this program, through Miss Anderson's chairmanship, permeates the committee work of all the clubs in the United States with this Bolshevik doctrine. Then remember that through interlocking directorates practically the same program percolates through many organizations *not* affiliated with the National Council of Women, such as the National Women's Party, the National Women's Trade Union League, the International Suffrage Alliance, and others.

Note the important affiliation consummated through the appointment of Miss Charl Williams of the National Education Association as chairman of Elementary Education in the National Council of Women. Since Miss Whitney, the chairman of education, recommended her appointment, it is evident that she is expected to be sympathetic with the present politics of the organization. Certain it is the N. E. A. is strongly impregnated with Pacifist-Socialist propaganda, as its recent convention work proves.

Resolutions passed by small delegated bodies representing great organizations endorse the legislative program of Soviet Russia in the name of reform, of peace, and of child welfare, and the great majority of the membership of these organizations are unaware that a revolution in the United States is being set on foot through this work of women. The most valuable work being done to destroy Constitutional Government is being done by those who deny that they are radicals. Most of them believe their own statements. Radicalism is a wordy system with many aspects. Few people recognize it unlabeled. It is time that we examine beneath the label.

Few people understand the program of deceit which is essential to put across that portion of the radical program which they term "The Bloodless Revolution," or revolution by the ballot.

Let us now examine some of the most illuminating statements from the official records of the Communists.

The Third Congress in conjunction with the International Women's Congress at Moscow, July 8, 1921, adopted the following resolution: "The interest of the working class, especially at the present moment, imperatively demands the recruiting of women into the organized ranks of the proletariat fighting for Communism in all places where the Communist parties exist

Cut-over pine land suitable for recreation purposes only. It is Lake Guthrie Forest Reserve, Otsego County, Michigan

Exploitation of Cut-over Lands

Lands of Lake States, Denuded of Timber, Worthless for Farms, Are Sold to Unwary

By J. C. GILBERT

Above—Virgin Norway pine growing in Northern Michigan on poor, sandy soil, unfit for agriculture but valuable for saw log culture. Left—A white pine plantation, 22 years old, on bare sand, for reclamation purposes.

A CENTURY ago land settlement was of a spontaneous character. Pioneers sought the life of their own initiative. At that time the great fertility of the Middle West called. Entire families broke away from Eastern United States and with their meager household goods stowed away in covered wagons they sought the fruitful lands of the Ohio and Mississippi valleys. With ox-teams they traveled in caravans ever westward where a generous government gave them all the land they wanted at a price within reason. Whole sections were homesteaded. Fathers, looking ahead, purchased other sections of the rich prairie lands. Teeming cities sprang up. An increasing population demanded more food, which in turn created a further demand for farm lands. Again the westward migration.

The Civil War was fought. The released soldiers, sons of pioneer fathers, thirsting for excitement, swept beyond the Mississippi Valley, up the Missouri and over the Rocky Mountains to the coast of the Oregon country. Other countless thousands swarmed through Missouri, Arkansas, Oklahoma and Texas. Still later the great unfenced ranches were bought up and cut into farms. Today the last good land is going fast. The old days of free lands have passed. Government and railroad concessions are no more. Good land costs real money. Poor land may be had for paying the delinquent taxes.

Photo by courtesy U. S. Forest Service.
Cut-over hardwood land. This is valuable farming land. Rich humus has been formed by decaying leaves of deciduous trees. No ground fires have burned through as they do in open pine forests.

Investigations made by the government into methods of land settlement in the Lake states indicate that elaborate advertising and high-pressure salesmanship have induced many persons, unfitted for pioneering, to take up raw cut-over lands. The Lake state governments, in many instances, maintain bargain counters for tax-reverting land, peddling them out for twenty-five to fifty cents an acre and exercising no supervision whatever over the disposition of much land not well suited to agriculture. Various private colonization firms, many of them having their headquarters outside the state in which the land is sold, buy vast tracts of this wild land at bargain prices. This land can be sold provided enough selling pressure is exerted. The land itself, in most instances, is absolutely worthless for anything but the growing of pine timber. It is not even third-rate farming land, as it is largely sandy plains, with a second growth of scrub oak, poplar and pin cherry. Some of it is swamp land, low and unhealthy. Much of this worthless land has been sold and most of the purchasers are city people, bamboozled into paying their hard-earned cash for land of a quality that was reverting to the state at the rate of thousands of acres a year because of the failure of the original owner to pay his taxes after he had lumbered off the timber.

The degree of fraud at times is almost unbelievable. Many a hard-working factory hand has come on to this land from the city. Untrained as an agriculturist, he has found, in many instances, that he has drawn a blank, on which even an expert farmer could not raise anything of value. Perhaps he bought it in the winter time when snow covered the ground. Possibly he was shown excellent crops growing on hardwood lands adjoining the pine barrens and was led to believe that the pine lands would produce equally well. Crop rotation means nothing on the burned-out plains. Something does grow on the plains, but in most cases it is an exceedingly scrubby forest of second growth, or it is a low-ground cover of huckleberry, sweet-fern and herbs that make a sod close to the surface. One inch below the roots is the mineral soil, perfectly sterile as far as farm crops are concerned. In many instances forest fires, following the lumberman, have cleaned out the little humus deposit.

Again, perhaps the promoter will hold out the promise of cattle or sheep ranching. This region has been exploited many times for extensive grazing purposes. But unless the rancher has a farm in connection with the grazing industry, his project is doomed. The snow falls in early November and rarely leaves before March 15, frequently later. That means he has to winter the stock for practically five months. Many and extended trips through that country have failed to reveal a bona fide successful ranch project, such as is possible in Texas or other western states, where ranching is practicable.

In this same cut-over pine country are tracts of excellent fertile land. This is land upon which have stood the hardwood forests, deciduous trees which for centuries shed their leaves, enriching the earth. Frequently clay soil is found in the hardwood forest cut-over districts. This land is rarely exploited for the reason that it is really valuable and the owners know its value and either hold it as a speculation or sell it to someone familiar with farming conditions in that section. The buyer of such land clears it of stumps and plants potatoes, grain and other farm products and is invariably successful because the humus is rich on this cut-over hardwood land. It is a little too far north for corn such as is raised in Iowa, Illinois and Indiana, although Indian corn or maize does well when given proper care. A visit to the county fairs is decidedly interesting. The excellent crop and the diversification in crops are a revelation. The railroads run through the worst section of the country because the rail was laid into the pine forests to exploit the cheap lumber forty or fifty years ago. Hardwood was worthless and no railroads were built into it.

There is enough first-class agricultural soil in the cut-over regions of the Lake states to absorb at least all the settlement it can anticipate for fifteen years. The promoter passes up this type of land. He is out for big profits and quick deals. He is a sharper who plays on the land-hungry factory worker of the city who yearns for the out-of-door life he has learned to associate with the farm. He comes and is disillusioned.

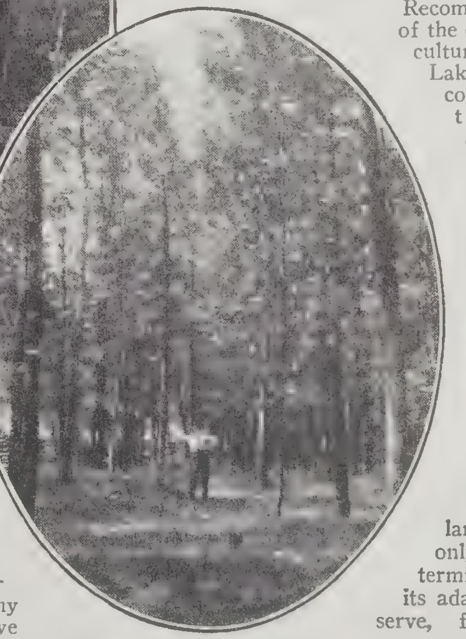

Photo by courtesy U. S. Forest Service.
A stand of hardwood, 25 years old. This is good farming land.

Recommendations of the deans of the departments of the agricultural colleges of the three Lake states, Michigan, Wisconsin and Minnesota, and the commissioners of agriculture for the Lake states are, in this connection, most interesting. An excerpt from their report reads as follows:

"We condemn any policy of exploitation at the expense of the new settler and strongly urge a policy of development for the benefit of the states and the extreme of good faith for the benefit of the settler.

"Classification of land is essential. It is the only sane method for determining the soil's best use; its adaptability for game preserve, forest reserve, special crops, or general farming. We urge a complete and state-wide land classification of all the areas of our respective states."

The foregoing should be sufficient to squelch the land boomer. Yet it fails to do so.

Many lumber companies maintain farm-land departments in connection with their lumbering business. They seek to dispose of their cut-over lands through these departments, selling lands from ten dollars up to fifteen dollars an acre. Generally they take fifty dollars or one hundred dollars down, and give the buyer ten years' time to pay for the land at six per cent. Much good land is thus disposed of, for most lumber companies are now operating in hardwood sections where the soil is much more fertile than on the pine plains. The buyer finds that it costs from ten dollars to one hundred dollars an acre to clear this land after he has purchased it. In practice the settler does not usually actually clear the land. He goes over it and piles the brush and cuts

(Concluded on page 12)

COLONEL DINSHAH P. GHADIALI, M. D., M. E., D. C., Ph. D., LL D., et cetera, who has come out of the Orient to heal all the ills of mortal man, except broken bones, by playing upon the afflicted rays of light passed through colored glass He is shown operating his "graduate equipment for spectro-chrome therapy, price $425, net cash with order, F. O. B., New York." With him in this photograph are his wife, Irene Grace Ghadiali, who claims to be an American, and their daughter (right) Kashimira.

Colored Glass Now Cures All Our Ills

By ROBERT MORGAN

OF ALL the remedies for disease which have been poured down the throats or rubbed on the skins of humanity, from the pulverized dried toads of the Mongol shaman to the bunkum boxes of the late Albert Abrams, none is more interesting than the latest and newest of all of them. Born in the brain of a clever gentleman, a Parsee, this most recently devised cure-all is now licensed in seven states, though unapproved by the recognized medical authorities of any; numbers hundreds, if not thousands, of "students," which is another name for practitioners; and is starting into the pockets of its proponents a steady flow of gold which, very shortly, will compare favorably with that pumped up by the oscilloclast, previously described in these columns.

The most modern form of remedial medicine, or the latest scheme to separate the American from his money—whichever you choose to call it—consists simply of passing ordinary electric light through a plate of colored glass, and playing the beam of light so colored on that part of the human anatomy in which pain is felt. Understand distinctly, here and now, that this has no connection with the X-ray, the violet-ray, the Gamma-ray, or any ray created by varying intensities of electric current and varying degrees of vacuum. It has none of the qualifications, qualities, or healing capabilities of any of these rays. It creates no ray of any kind, has no vacuum or other tubes in its instruments, and plays colored light upon the subject of its "treatments" in the same manner that the sun plays beams of vari-colored light through the stained-glass windows of a church upon the heads of the worshipers.

The new cure-all is traveling under the name of "Spectro-Chrome Therapy." It is distributed by the "Spectro-Chrome Institute," incorporated under the laws of New Jersey, with its headquarters, known as "the central office and experimental laboratory," at 2401 North Broad street, Philadelphia. The real headquarters of the self-styled "latest revelation in the healing art," however, is in the mind of the peripatetic Colonel Dinshah P. Ghadiali. M.D., M.E., D.C., Ph.D., LL. D., Metaphysician, Psychologist, and Ex-Commander of the New York Police Reserve Air Service, to quote in full the titles which he gave me when I called on him at the conclusion of one of his Personal Intensive Experimental Courses. He had just finished giving this course to 243 "students" at an average price of $50 each for the two weeks of instruction.

Colonel Dinshah (name copyright, 1921, United States of America) travels about the country organizing classes in spectro-chrome therapy and leaving behind him all the way from 200 to 400 persons, most of them with no medical training whatever, and still less knowledge of anatomy or pathology, "equipped to treat competently and successfully every dis-ease to which man is liable." He has so far organized these classes, and left behind these groups of spectro-chrome therapists in New York. Pennsylvania, Maryland, Illinois, Michigan, Ohio, Delaware, New Hampshire, Indiana, Rhode Island, Connecticut, and California. He has held classes and trained his followers in at least two cities in each of these twelve states. In other words, there is a minimum of twenty-four cities in the United States in which you may, if you dare, put your life in the hands of men and women who have little or no medical training, and who will treat you for anything from acne to syphilis by illuminating you with a beam of light passed through one or more colored glass plates.

The master of spectro-chrome therapy, who invented the cure-all, and who, cleverly enough, teaches others to use it, but will not treat a patient himself, is by his own statement a Parsee. The Parsees are held to be Semitic people, who followed the mysterious Zoroaster rather than the God of Abraham, Isaac and Jacob, and were driven out of Persia, about the seventh century, by the Mohammedans. The followers of the Prophet frankly admit that they expelled the Semites because of the latters' general dishonesty and trickery, and not because of a difference in religion. There are about 90,000 Parsees in Bombay, where they are known as "the Jews of India," while a remnant remains in Persia, known as the Guebres. This digression is merely by way of demonstration that to the tribe of Mesmer, Friedman, Abrams, and others, we are now permitted to add the discoverer, demonstrator and distributor of spectro-chrome therapy.

To accept it at its own definition—though by no means at its own valuation—spectro-chrome therapy is "the restoration of the human radio-active and radio-emanative equilibrium," involving "the treatment of diseases by attuned color waves." It is further revealed to a world waiting long for the perfect accomplishment of the healing art, as "the science of therapeutical precision." Oddly enough, yet with great reason, as we shall see presently, no mention is made of diagnosis, without which, according to unanimous word of all the men who daily save lives in the name of medicine and surgery, treatment of disease is impossible.

Like Mother Nature in her abhorrence of a vacuum, spectro-chrome therapy casts into outer darkness all drugs, all manipulation, and all surgery. And that's that, finally, definitely, and conclusively. Spectro-chrome therapy depends for its cures—and we are assured that they are many though none are listed, and no testimonials are available—on light, but only on light which has been passed through instruments devised, built and *SOLD* by Colonel Dinshah P. Ghadiali. Because of his use of these colored glass plates, and the resultant color combinations with which he treats what he calls dis-ease, Dinshah has assumed the name, among his students, and those whom he has placed on the highway to wealth, of the "Rainbow Doctor." It is an apt and deserved title, not only because of the colors he extracts from his plates, but from the ancient story of the pot of gold at the foot of the rainbow.

Spectro-chrome therapy, according to statements made directly to the writer by Colonel Ghadiali, is based on the alleged discovery by him that the human body is composed of four elements, or colors: Hydrogen, 9.1 per cent; carbon, 13.4 per cent; nitrogen, 2.5 per cent, and oxygen, seventy-five per cent. These "elements"—I am quoting Dinshah—have preponderating color waves, as follows: hydrogen, red; carbon, yellow; nitrogen, green, and oxygen, blue. "Thus," said he, "ninety-seven per cent of the human body is made up of these four elements, and therefore is responsive to the wave potencies of these four colors. In health, that is to say, when we are well, these elements (colors) are evenly balanced in the body, but disturbance of any one or all of these colors produces dis-ease. The color balance can be restored only by administering more color to the body lacking one or more of these elements or colors, and reducing color when the amount in the body has been unnaturally increased. Every element in the world—of which there are 86—exhibits a preponderance of one or more of the colors which exist in the light from the sun. These colors in the sun's light are red, orange, yellow, green, blue, indigo and violet."

The rather generally accepted opinion of Sir David Brewster that the three so-called "primary" colors are red, yellow and blue, is peremptorily rejected by our visitor from Bombay, who finds, "spectroscopically, chemically, mathematically, geometrically and microscopically, that the three primary colors are red, green and violet, as only from these three colors is it possible to produce white light by the addition of one color to another or complete blockade of light by the reverse process, that is, by subtraction." I leave this quotation with you, merely as a shining example of many statements made by the discoverer of spectro-chrome therapy *which begin nowhere, mean nothing and end where they began.*

The point is that, in simple language, spectro-chrome therapy considers that every part of the human anatomy, from the hair on the head to the sole of the foot, is attuned to a particular length of color wave. Now, there are such things as color waves, and color wavelengths differ, but it is elemental that where there is no light there is no color, since color is merely the reflection of light from a surface. In other words, in a completely darkened room, into which no ray of light can penetrate, all objects are the same, black. So far as the best of anatomists know, there is no light in the interior of the human body, unless that light is introduced by methods of internal illumination now known and applied in certain operations. No amount of light on the surface will illuminate the interior of the body. But the spectro-chrome therapists do not apply their light to the interior of the body, but solely to the outside. Here is an example:

"With what color of light would you treat appendicitis?" I asked Colonel Dinshah.

"With turquoise on the right side," he replied.

"Now suppose," said I, "that the man who had appendicitis also was afflicted with constipation, a common corollary of the inflammation of the appendix. What color do you use for that?"

"Yellow on the right side," he answered.

"Could you treat for both conditions at once?"

"Certainly; merely put the two plates—turquoise and yellow—together, and play the light on the right side of the abdomen."

"Which plate would you place nearest the patient, yellow or turquoise?"

"That makes no difference. The color waves are so attuned in my plates that they will reach their destination in the correct composition and form, no matter what their relation to each other."

I would like to leave this thought with my readers, merely pointing out that it is an admission on the part of the spectro-chrome therapists that the skin of the body, or any ailing organ of the body, has the power to separate, as does a prism, any light into its component colors, taking into that ailing organ only that color necessary to restore the "color balance" needed to eliminate dis-ease. If this be true, why have color plates? Why direct the beams of light through colored glass onto any particular region of the body? Why not stand, stripped to the skin, in bright sunlight? The light of the sun contains all the colors the spectrum can find, and probably some that the human eye can neither see nor appreciate. If the Semitic discoverer of spectro-chrome therapy can so unite various colors that your body and mine can separate them, is it not just as probable that the One who hung the sun in the heavens and put the chemical laboratory in a blade of grass, can mix colors in such fashion that they may be of as much benefit to man as to the plant?

But sunlight is free, and it costs money to get spectro-chrome therapy into your system, or, more accurately, on to your skin. No spectro-chrome therapy is genuine, no glass plates are properly colored, no color waves are correctly attuned, unless they come from the "complete equipment for spectro-chrome therapy," invented, patented, copyrighted, trade-marked, built and sold by Colonel Dinshah P. Ghadiali and distributed by the Spectro-Chrome Institute, 2401 North Broad street, Philadelphia. Mark that Colonel Dinshah has not returned to the land of his birth to spread over the sick and the dying the mantle of his great discovery; he has not carried it to India, where more human beings die in misery every year than in any other equal population, not even excepting China, on this troubled earth. The discoverer of spectro-chrome therapy has brought his invention to the United States, where the death rate is low, *but the per capita wealth is the highest in the world.*

At the risk of making a sales talk for the Spectro-Chrome Institute, 2401 North Broad street, Philadelphia, allow me to mention the machinery by which the healing of spectro-chrome therapy is wrought, according to Colonel Dinshah (copyright, 1921, U. S. America). The instrument in its various forms, differentiated not for different treatments, but to fit the pocketbook of the purchaser, consists solely of a light-tight box, into which is introduced an electric light which can be operated from the ordinary 110-120-volt circuit, that is to say, the regular electric light plug. In one end of this box is an opening controlled by a shutter. Now comes the health-giving key to the whole system of treatment, a set of five pieces of window glass, colored respectively red, yellow, green, blue and violet. With combinations of these glass slides—all of which, by the way, can be purchased in any well-stocked ten-cent store, though none of them will be attuned by Colonel Dinshah—seven other colors can be produced, orange, lemon, turquoise, indigo, purple, magenta and scarlet. These twelve form the gamut of colors used by the spectro-chrome therapists, though there have been brave souls among the "students" who have tried others and have reported "wonderful results." Sometimes Nature cures us in spite of the "healers."

THE SCIENCE OF THERAPEUTICAL PRECISION

No Drugs—No Manipulation—No Surgery

This is the only opportunity to hear this distinguished, masterful orator. Born, bred and trained a Parsee Zoroastrian in mystic India, DINSHAH attended High School at 8, was Assistant to Professor of Mathematics and Science of Wilson College at the age of 11, and at 14 was experimental demonstrator in Chemistry and Physics in seven institutions of learning. At 17 he appeared before the public as an independent and fearless lecturer. He was the first in 1896 to lecture in New York on the X-rays, and has won by his inventions international fame and the sobriquet of "Parsee Edison." Spectro-Chrome Therapy, the result of [illegible] years of his laborious researches is now used by prominent physicians, surgeons, osteopaths, dentists and others and hailed as the most radical and revolutionary departure striking at the fundamentals of the Healing Art. Among numerous honors showered on him, the latest was by the Maryland Academy of Sciences—life membership with the rank of Academician.

8 P. M. Friday, Dec. 14, 1923, 8 P. M. Saturday, Dec. 15, 1923, in Assembly Room, Hotel St. Francis, San Francisco, Cal.

Students enrolling now for complete course; open to professionals and laymen of both sexes. Spectro-Chrome Institute has no correspondence course, creates no "Doctors" and its graduates have nothing to do with the "Practice of Medicine."

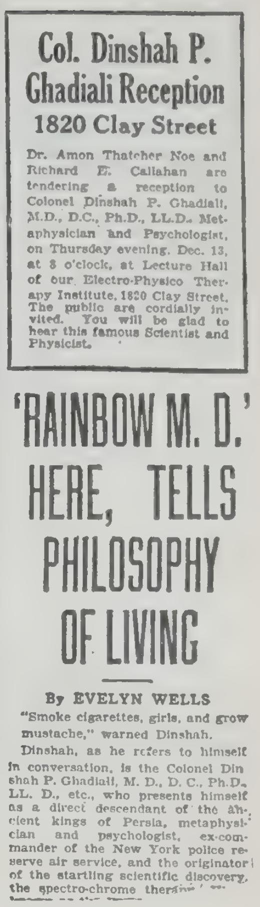
Personal Intensive Experimental Course Begins Monday, Dec. 17, 1923, 7 P. M., in the Lecture Rooms, 262-263 Hotel St. Francis, San Francisco, Cal.

SPECIAL PUBLIC RECEPTIONS

On Saturday, December 15, and Sunday, December 16, special receptions will be held by Col. Dinshah in his EXPERIMENTAL LECTURE HALL, Suite 262, at the Hotel St. Francis, from 2 to 4 p. m.

All interested in the welfare of suffering humanity will be cordially welcomed and their questions gladly answered.

No Admission Fee No Obligation No Collection



Col. Dinshah P. Ghadiali Reception
1820 Clay Street

Dr. Amon Thatcher Noe and Richard E. Callahan are tendering a reception to Colonel Dinshah P. Ghadiali, M.D., D.C., Ph.D., LL.D. Metaphysician and Psychologist, on Thursday evening, Dec. 13, at 8 o'clock, at Lecture Hall of our Electro-Physico Therapy Institute, 1820 Clay Street. The public are cordially invited. You will be glad to hear this famous Scientist and Physicist.

'RAINBOW M. D.' HERE, TELLS PHILOSOPHY OF LIVING

By EVELYN WELLS

"Smoke cigarettes, girls, and grow mustache," warned Dinshah.

Dinshah, as he refers to himself in conversation, is the Colonel Dinshah P. Ghadiali, M. D., D. C., Ph.D., LL. D., etc., who presents himself as a direct descendant of the ancient kings of Persia, metaphysician and psychologist, ex-commander of the New York police reserve air service, and the originator of the startling scientific discovery, the spectro-chrome

Standard advertisements used by Ghadiali in his newspaper campaigns, and part of free publicity given the clever Oriental by a city editor of a San Francisco newspaper, who sent a special 'sob-sister' to 'interview' him.

This is the total of the equipment. The colored glass plates are placed over the opening in the light box, according to directions in the "Compendium of Spectro-Chrome Therapy" (price, $2, cash in advance), written by Colonel Dinshah, and now in its fourth edition. Then the light is turned on at the socket, and, if your city power plant is on the job, you are ready to treat all comers, no matter what their ailment, except broken bones, which spectro-chrome therapy, like some of the metaphysical mysteries, does not yet attempt to heal. As I said before, sunshine, which has all the healing properties of spectro-chrome therapy, and some others besides, is free, but the graduate equipment, described above, for the administration of light through colored glass plates, costs $425 f. o. b. New York and all prospective customers are advised here and now by both Colonel Dinshah and myself that this price, as well as others soon to be quoted, is "net cash with order." There is no reduction to physicians, surgeons, dentists, osteopaths, chiropractors or Santa Claus. It goes as it lays, take it or leave it, and the buyer pays the freight. The $425 machine probably costs, packed and ready for shipment, approximately $75, the most expensive part being the iris diaphragm for the control of the light, which can be bought at retail for about $12. Incidentally, if you break your diaphragm—I mean the one in the instrument—Colonel Dinshah will sell you a new one at $15, net cash in advance, f. o. b. New York. This is three dollars more than the average retail price.

If, however, you haven't $425, you are not entirely absent without luck in the spectro-chrome therapy field. You can buy the practitioner's equipment for $150; intermediate equipment for $90; standard floor equipment for $60, and standard table equipment for $50. More than this, if you live in the country or in a town which hasn't electricity, you can get the standard gas equipment, which will operate either on acetylene or ordinary illuminating gas for $45. The writer has heard of some "graduates" of the Spectro-Chrome Institute who are doing quite well, even in the big cities, with only the gas equipment, so there is no need for the poor man to be discouraged. It is probable that the gas equipment, too, is the only one which is sold at only about twice what it costs to make it. That may be some consolation to the thrifty buyer; if he advertises right, he should be able to get back his $45 in a day or two.

Now, supposing that you have the money in hand with which to buy your equipment, how would you proceed to learn how to use it? The common supposition is that our state laws, our city ordinances, and our state, county and city medical associations pretty well protect us from the man who attempts to practice medicine without a license. That is, we are in a good measure safeguarded from the charlatan, the medicine man and the quack. But there are those who are, in fact, practicing medicine with state, county or city licenses who are doing uncounted harm, yet are safely within the law. Of such are the E. R. A. practitioners, whom the writer recently investigated and described in these columns. There are others who, not possessed of either license or permit, are treating people for diseases, though not administering medicines, who seem to be safe from the law. Of such are the "graduates" of the Spectro-Chrome Therapy Institute. Here is the system employed to treat the sick with this magic-lantern outfit and the "attuned color waves" it throws on the screen of human suffering:

First of all, one must have at least $50. Then one learns where and when the traveling president of the Spectro-Chrome Institute will hold his next series of "personal intensive training classes, with experiments and demonstrations." When this was written, he was in Los Angeles, where his class in the Lankershim Hotel numbered 308, at a minimum figure of $50 each, for the twelve days of training. From there he was to return to Philadelphia, and thence into the Pacific Northwest, Seattle, Aberdeen, Portland and Astoria. You'll have no trouble getting into the class, no matter how many are already there, and, if you can persuade the master of spectro-chrome therapy that you have only $50, you'll get in for that sum.

Hotel Lankershim,
Los Angeles, California,
December 31, 1923.

Esteemed and Learned Progressive:

SPECTRO-CHROME THERAPY has come to the Golden West!

Its universal message has successfully been delivered in the States of New York, New Jersey, Pennsylvania, Maryland, Connecticut, Rhode Island, Massachusetts, Illinois, Michigan, Ohio, Indiana, California and Washington D. C.

Everywhere it was endorsed with enthusiasm by prominent surgeons, allopaths, homeopaths, dentists, osteopaths and others who are using it daily.

SPECTRO-CHROME THERAPY totally replaces Drugs, Manipulation and Surgery and has that "Therapeutical Precision" hitherto unknown.

I shall be at the stated address on the date mentioned. You are cordially invited to my introductory lectures there, on Friday and Saturday, the 4th and 5th of January at 8 P.M.; also to the Receptions on Saturday and Sunday, the 5th and 6th of January from 2 to 4 P.M.

The Nineteenth Class for Personal Intensive Training with Experiments and Demonstrations will open there on Monday, January 7th 1924 at 7 P.M. The course lasts two weeks.

There will be no follow-up letters or repeat courses. This is YOUR opportunity.

Yours in the Service of Humanity.

DINSHAH P. GHADIALI

President,
SPECTRO-CHROME INSTITUTE.

The "come-on" letter which Ghadiali uses to initiate his campaign for "students" in each city to which he devotes attention. This letter, backed up by newspaper advertising, and by a quantity of free space given to him by gullible or avaricious newspapers, drew 243 men and women to take his series of lectures in the St. Francis Hotel, San Francisco, in December, 1923. These men and women paid an average of fifty dollars each for their "personal intensive experimental courses in Spectro-Chrome Therapy," and thereafter, before they could get this money back from the ills of the public, had to buy their instruments from Ghadiali.

As you near completion of this course, you will receive a diagram which will show you just which color wave has control over each part of the body. Here is where you learn the marvelous diagnostic method of spectro-chrome therapy, which may be involved in these words: "the seat of the dis-ease is where the pain is." That is, if the patient has a headache, it is not due to pressure of the blood on the brain, which the rigidity of the skull will not allow Nature to relieve by expansion, but to a falling out of tune of the "color waves" of the brain, which, by the way, are red, lemon, yellow, scarlet, violet, magenta, indigo, green, and blue, with green as the "preponderating wave." The writer rather thanks whatever angelic guardians he may have that on a recent occasion, when he suffered rather heavy pains in the lumbar region, he did not call on a spectro-chrome therapy expert, because the removal of two unsuspectedly bad teeth revealed by the X-ray, removed the pain. Surely no cardboard diagnostic map ever would have suspected that those teeth were responsible.

After you get your diagnostic map, or the charts, of which there are several, your Compendium of Spectro-Chrome Therapy, your Universal Mirror, "showing cosmic evolution," and probably the Occult Operation of the Great Sympathetic Nervous System, "the only correct medico-ontological chart," then you will have completed your twelve lessons and be entitled to your diploma as a graduate of the great new "science of therapeutical precision, the latest revelation in the healing art, the school of spectro-chrome therapy." Armed with this diploma and with your instrument, your colored slides, your charts, your cosmic mirror, and your compendium, you may sign "S. C. T." after your name, and throw all the hues of the rainbow on any sick person who comes to you, without the law saying a word. Indeed, you must be more careful of your colored glass slides than of the "treatments" you administer, because, if you break one slide, your whole set is out of tune, and you have to return it to the Spectro-Chrome Institute, 2401 North Broad street, Philadelphia, not forgetting to send with it three of your Uncle Samuel's dollars. By return mail you will get a new set of properly attuned plates. You can buy a dozen just like them for five cents each or a total of 60 cents, at the five-and-ten-cent store, but they wouldn't be in tune with the infinite, like the three-dollar plates are.

There is, however, a warning to graduates issued by Colonel Dinshah, which each graduate should remember. It would be a good thing for his health if the prospective patient would remember this warning, also, and here it is:

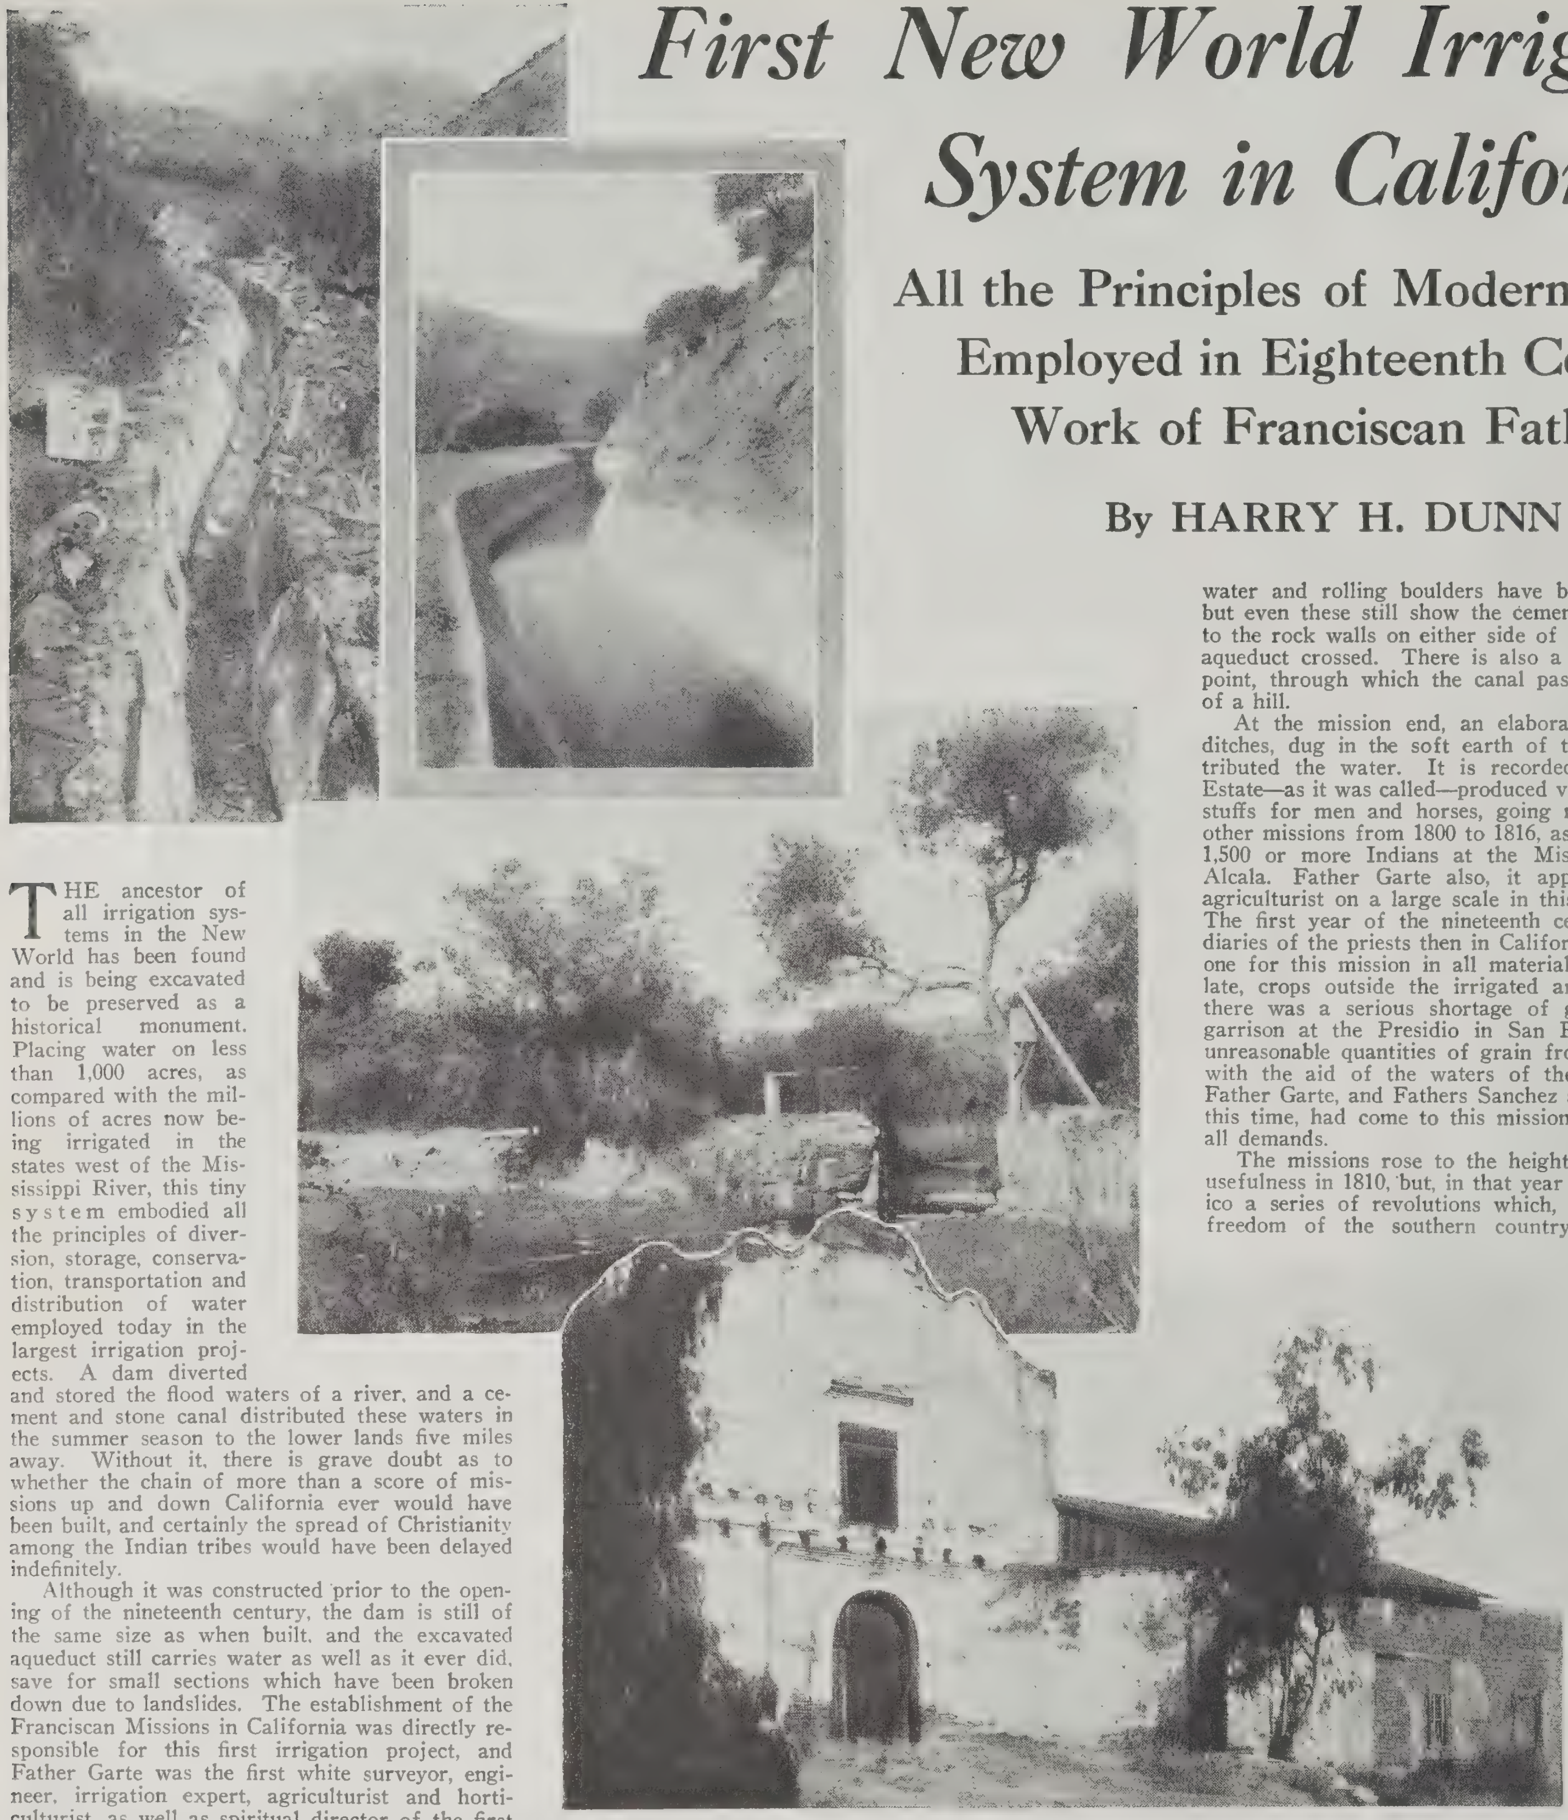
> "1. Do not use with your name the title of 'Doctor' unless you have a degree entitling you to such distinction; the certificate of your study at the Spectro-Chrome Institute gives you the true identification of 'Spectro-Chrome Therapist,' and you ought to stick to it.
>
> "2. None can deny your right and privilege to use S. C. T. with your name, because your graduation at the Spectro-Chrome Institute entitles you as such. The Spectro-Chrome Institute charter provides for this specifically.
>
> "3. Unless you are registered as a practitioner of another system of therapy which licenses you as such, use no other system in combination with Spectro-Chrome Therapy, but use and treat with only Spectro-Chrome Therapy.
>
> "4. Do not use terms such as are used by regular physicians, surgeons, osteopaths, chiropractors and the like, but stick to the color-wave predominance system, as instructed by the originator of Spectro-Chrome Therapy. Your patient has certain Color Waves increased or decreased in the system which is thereby placed out of the health equilibrium or 'out of tune,' and you have the means of restoring the said equilibrium or 'tune' by attuned Color Waves.
>
> "5. Do not use the word 'dis-ease'; your patient in health is at 'Ease'; when the said 'Ease' is disturbed, there is 'DIS-EASE.' Use the word

(Concluded on page 13)

First New World Irrigation System in California

All the Principles of Modern Method Employed in Eighteenth Century Work of Franciscan Fathers

By HARRY H. DUNN



Extreme top—Section of the five-mile tile, stone and concrete conduit, through which flowed the first water ever used by white men for irrigation in the New World. The grades of this conduit are perfect, and the cement and stone work for most of the distance still will carry water. At its right—A modern irrigation canal carrying approximately 200 times the water carried by the first irrigation conduit. Center—The dam of the San Diego River by which the flood waters were diverted and stored in the flood season for use in the summer at the Mission San Diego de Alcala, 150 years ago. Directly above—The ruins of the Mission San Diego de Alcala.

THE ancestor of all irrigation systems in the New World has been found and is being excavated to be preserved as a historical monument. Placing water on less than 1,000 acres, as compared with the millions of acres now being irrigated in the states west of the Mississippi River, this tiny system embodied all the principles of diversion, storage, conservation, transportation and distribution of water employed today in the largest irrigation projects. A dam diverted and stored the flood waters of a river, and a cement and stone canal distributed these waters in the summer season to the lower lands five miles away. Without it, there is grave doubt as to whether the chain of more than a score of missions up and down California ever would have been built, and certainly the spread of Christianity among the Indian tribes would have been delayed indefinitely.

Although it was constructed prior to the opening of the nineteenth century, the dam is still of the same size as when built, and the excavated aqueduct still carries water as well as it ever did, save for small sections which have been broken down due to landslides. The establishment of the Franciscan Missions in California was directly responsible for this first irrigation project, and Father Garte was the first white surveyor, engineer, irrigation expert, agriculturist and horticulturist, as well as spiritual director of the first mission established by the Fathers of St. Francis, San Diego de Alcala, in 1769.

When this mission, now a moldering ruin, although one of the most important historical monuments in the Americas, was founded, other irrigation canals had been dug, used for centuries and abandoned on this continent, by the agricultural Indians of what is now the Gila River Valley, in Arizona, but these Indians had built no diversion or storage dams or reservoirs, and had no adequate distribution system, so that Father Garte's project was in reality the first complete irrigation system in North America, as well as the first to be established by white men in the Western Hemisphere. As soon as Padre Junipero Serra, Father of the Missions, announced his plan of a chain of these outposts of Christianity, it was recognized that the first mission would have to furnish the grain and other food supplies necessary to the expeditions by priests and soldiers to found the other missions.

Then Father Garte, who seems to have combined remarkable executive ability and wide practical knowledge with his spiritual devotion and religious enthusiasm, set about providing the foodstuffs without which the twenty-two California Missions never could have been established. With only a force of indolent Indians, who never had had the incentive to work, or the desire for the gain to be attained by labor, he constructed this irrigation system, placed more than 1,000 acres of land under irrigation and provided a domestic water supply for more than 1,500 brown-skinned children of the sun at San Diego de Alcala. Selecting a natural bowl in the course of the San Diego River, he so aroused the enthusiasm of these Indians that they carried in their arms more than 5,000 huge boulders, dropping them in a wide trench they had dug for 224 feet across the mouth of the natural basin to form the foundation of the dam.

Then they hacked down a hill of lime rock, and, under this remarkable priest's direction, burned it into lime and made with sand from the river bed a hydraulic cement. Thereafter, the Indians, using harder stones as chisels, flattened other stones until they could be laid in regular rap-work, with cement, on the foundation boulders, among which cement was poured until a solid block, 224 feet long, 12 feet thick and 14 feet high on the lower side, was made. Then the whole monolith was faced with several inches of the homemade cement, smoothed down and polished by hand with the flat stone called "takkish" which were used in plastering the missions in lieu of the metal trowels now used by masons and plasterers. A floodgate of hand-hewn oak timbers was installed, and this alone has yielded to time.

From the lower end of the dam, an aqueduct, constructed by laying half a tile on cobblestones let into a trench and then cemented together, and setting slabs of hand-shaped stone on the edges of the tile to form the walls, which then were cemented together, ran to the mission fields. This conduit, which was virtually a solid trough of tile, cement and stone, was two feet wide at the top, one foot wide at the bottom and about eighteen inches deep. It, too, was controlled by a wooden gate, and followed levels which modern irrigation engineers declare to have been laid out as perfectly as they could be established today.

This canal follows for five miles a precipitous rock-walled gorge, impassable to a man on horseback, and difficult to negotiate on foot. It frequently crosses gulches from fifteen to twenty feet wide and five to twelve feet deep, being suspended by its own strength and the strong cement made by the Indians across these arroyos. Some of these crossings are still intact. High water and rolling boulders have broken down others, but even these still show the cement clinging in ridges to the rock walls on either side of the gulch where the aqueduct crossed. There is also a short tunnel at one point, through which the canal passes under the point of a hill.

At the mission end, an elaborate system of small ditches, dug in the soft earth of the farm lands, distributed the water. It is recorded that this Mission Estate—as it was called—produced virtually all the foodstuffs for men and horses, going northward to found other missions from 1800 to 1816, as well as feeding the 1,500 or more Indians at the Mission San Diego de Alcala. Father Garte also, it appears, was the first agriculturist on a large scale in this part of the world. The first year of the nineteenth century, according to diaries of the priests then in California, proved a severe one for this mission in all material ways. Rains were late, crops outside the irrigated area were poor, and there was a serious shortage of grain. The Spanish garrison at the Presidio in San Francisco, demanded unreasonable quantities of grain from the mission, but, with the aid of the waters of the San Diego River, Father Garte, and Fathers Sanchez and Martin, who, by this time, had come to this mission, were able to meet all demands.

The missions rose to the height of their glory and usefulness in 1810, but, in that year also, began in Mexico a series of revolutions which, while they won the freedom of the southern country from Spain, also marked the beginning of the downfall of the mission system throughout California. By 1821, the Mexicans were completely free of Spain, but in 1824 a final decree of secularization turned over all the mission estates to grasping, dishonest and unsympathetic administrators, sent on by the Mexican Government. The missions were stripped of everything of value, their Indians scattered, their agricultural systems abandoned, and their strength as religious centers virtually destroyed. The records indicate that the irrigation system at San Diego de Alcala was operated up to 1826.

Fifty years after Garte's irrigation system was abandoned, individual farmers began building their own little dams and canals in the same manner, but it was not until 1886 that an effort was made to bring water by aqueduct from the upper reaches of the San Diego River for the village which was to grow into the San Diego of today. It was about that time, also, that other irrigation and water-supply projects began to take form along the lines laid down by Father Garte, in other parts of what was then called the "arid West."

Meanwhile, the river filled in the back of the dam with boulders and with sand; landslides and winds and rains packed earth and stones into the conduit of that first irrigation system, and it is only this year that all of it has been traced back, excavated, and cleaned out, so that it now stands in virtually the same condition as when Father Garte, asking the blessings of God on his labors, raised the little oaken gate and allowed the first stored waters to pour down on the thirsty lands of the mission.

This gate, along with the larger floodgate, is to be restored, and the whole system is to be preserved for what it really is, a valuable historical monument of the early West. If it is possible to raise the funds, the Mission San Diego de Alcala, progenitor of all the Franciscan Missions in California, also will be rehabilitated, and likewise placed under the protection of the city of San Diego as a park. Engineers have reported that at an expense of less than $500 the dam, conduit and distribution ditches could be placed in such condition as again to deliver water to the mission.

Culpepper: by Name and Nature a Real Knight

In 1623 Sir Thomas Asked Parliament to Reduce Rate of Interest

By JOHN BASIL BARNHILL

AMONG the many happy warriors who have battled against extortion, Sir Thomas Culpepper (1578-1662) of Leeds Castle, Kent, England, was not the least distinguished. The reader must not confound him with the Thomas Culpepper, to whom Charles Second gave a grant to the entire colony of Virginia. The title-page of the exceedingly rare pamphlet in which the Knight of Leeds Castle presents his quaint, curious, and convincing arguments for a reduction of the rate of interest reads as follows:

A
Tract against the high
rate of
VSVRIE:

Presented to the high Court
of Parliament, *Anno*
Domino, 1623.

In which the ufe for Money was
brought downe from *Ten* to *Eight*
in the Hundred:

And now recommended to the Preffe
This third time with some Additions.
By the fame Authour.
LONDON,

Printed by *I. Norton*, for *Henry Seile*, and are to be
fold in Fleetftreet over againft Saint *Dunstans*
Church, 1641.

The last page of the pamphlet reads:

The eight of *March*, 1641.
Imprimatur, *H. Vane.*

"The Dictionary of National Biography" states that in an earlier plea Sir Thomas had asked that the rate of interest be reduced from ten to six per cent. Bacon, who wrote his essay on usury in 1625, asked that the rate be reduced to five per cent. It was reduced to eight.

It is with a feeling akin to awe that one holds in his hand this slim little tract which has come down to us from the age of Bacon, Shakespeare and Ben Jonson. Through its queer spelling and its quaint turns of expression shines a brave and honest heart who boldly attacked a practice that is being more and more clearly recognized as one of the clamorous problems of society.

The following extracts—in the quaint original—present the high lights of Sir Thomas argument against usury; the reader must be warned not to expect the sign of the possessive case as we know it today and he will observe various other orthographic and grammatical eccentricities:

WHAT WOULD MONIED MEN DO IF THEY GOT NO INTEREST?

Let us consider if money were called downe, what Usurers would do with their money; they would not I fuppose long be sullen, and keep it a dead stock by them, for that were not fo much as the safest way of keeping it; they muft then either imploy it in trade, purchafe land, or lend for ufe at such rate as the law will tollerate, all which is principally aymed at in the calling down the ufe for money, as that which would bee greatly to the good of the Common-wealth.

"MONEY HATCHETH NO EGGS OF HER OWN."

To the objection that if the rate were lowered money would be suddenly called in, and harder to be borrowed, I answer, that if the rate of ufe for money did increase money within the Land; that then it were an objection of great force, but wee very well know that money hatcheth no Eggs of her owne and that whatsoever is given for ufe, is taken, either from the fruits of the Land, or mans Industry, whereby the Land is embased, Merchants, Farmors, and Tradesmen difcouraged in their course, the Common-wealth much hindered, and none but the idle, unprofitable Ufurer advanced.

HOW INTEREST MULTIPLIES

To the weakest of Objections that there is now much money of Forreiners in the Land to be managed at ten in the hundred, which if money fhould be called downe would be carried out of the Land; there is no doubt it is true. But I defire to know, whether any man thinke it better for the State, that they fhould now carry out one hundred pounds, or feven yeeres hence two hundred pounds, or fourteen yeers hence foure hundred pounds; or one and twenty yeeres hence eight hundred pounds: for fo in effect on the multiplying of interest they doe.

It will feem incredible to fuch as have not considered it, but to any that will but cast it up, it is plainly manifest, that one hundred pounds managed at ten in the hundred, in seventy yeeres, multiplies itself to an hundred thousand pounds. So if there should bee an hundred thousand pounds of forreiners money, now managed here at ten in the hundred (and that doth feeme no great matter) that hundred thousand pounds in threescore and ten yeeres, which is but the age of a man, would carry out ten millions, which I believe is much more than all the coyne at this prefent in the Land. I know we cannot conceive how any fuch fumme should be managed at Interest, yet this is fufficient to make us little to joy in Forreiners money.

I conceive it will be fit to make a ftrict Law that no money of Forreiners may here be put out upon ufe. God made it lawfull for the *Jewes* to take ufury only of thofe whom it was lawfull for them to root out.

USURERS COULD NOT MAKE A WILL AND WERE DENIED CHRISTIAN BURIAL.

It may be objected that before the 37. of Henry 8. there was no limitation of Ufury, and how did we do then? To this may be anfwered that in thofe times there was a stricter band in that point upon mens confciences; So far forth as Usurers were in the fame cafe as excommunicate perfons, they could make no wils, nor were allowed Christian buriall. Therefore let us for our fore-fathers fake hope that the tye upon their confciences then, was a greater reftraint of ufury than the Statute of ten in the hundred is now. I feare fornication is too frequent among us, yet thanks be to God, not fo much ufed as where there is allowance of Curtizans and Stewes.

MONIED MEN CRY OUT: "GREAT IS DIANA OF THE EPHESIANS."

When the Statute was first made for the calling down the ufe for money, before the good effects thereof could be seen, there were many monied men who lived wholly upon ufury, and worshipped the Golden Image, who cried out with the Silver-Smiths, *That great was Diana of the Ephesians;* prophecying of many evils and mifchiefs, which would enfue: But experience hath fince fo convinced them, and ftopped their mouthes, as that I have not thefe many years heard any man open his mouth againft it. Nor have I met with any Ufurer who did not acknowledge Eight in the hundred a full and high rate for the ufe of money.

And there is reason: for fince the Usurer pays little to Subsidies, little to the poore man's box, repairs, nor builds no Churches, fets no laborers at work to the good of the Common-wealth, imploys none but Scriveners and Brokers, and those at the charge of the borrower, no man needs doubt, but there will be enough of the Occupation, though money be brought to five in the hundred: All the Laws of God are mercy, and for the good of Man, and if Ufury had never been in practice amongst us, there had certainly in this bleffed long time of peace, beene little poore land, few poore people in the Kingdome, but Ufury is now fo twifted into all commerce, that for the hardneffe of mens harts fome must (at least for a time) be fufferred, though from the beginning it were not fo, but this let us provide that wee bee not made poore with the fuperfluities of other Nations managed heere at Ufe, nor fuffer them to beate us out of many profitable trades, as now with gaine to themselves they doe, by reason Ufe for money is at a lower rate with them than it is with us, nor let us any longer bee patient to fee fo great quantities of land ly little better than wafte, which would moft certainly be improved to very good value, if the ufe for money were brought downe to a lower rate.

I will leave the proofes of the unlawfulneffe of Ufury to Divines, wherein a number, as well Protestants as Papists have learnedly written; and here only fet down fome arguments to fhew how great the hurt is, if doth to this Kingdome, which hath no gold nor silver Mines, but plenty of commodities, and many and great advantages of trade, to which the high rate of Ufury is a great prejudice and decay.

"USURY DECAYS TRADE."

For proofe, how much the high rate of Ufury decayes trade; we fee that generally all Merchants when they have gotten any great wealth, leave trading, and fall to Ufury, the gaine whereof is fo eafie, certaine, and great; whereas in other Countries, where Ufury is at a lower rate, and thereby lands dearer to purchase, they continue Merchants from generation to generation, to the enriching of themfelves and the State.

Neither are they rich tradefmen onely that give over trading, but a number of beginners are undone or difcouraged by the high rate of Ufury, their industry ferving but to enrich others, and begger themfelves.

We also fee many trades themfelves much decayed, because they will not afford fo great a gain as ten in the hundred, whereas if the rate of Ufury were not higher here than in other Countries, they had ftill fubfisted and flourished, and perhaps with as much advantage to the publike, as thofe that doe bring more to the private adventurers.

"BUSINESS AT A HIGH RATE OF INTEREST CANNOT COMPETE WITH BUSINESS AT A LOWER RATE."

Yet are not thofe the greateft hinderances the high rate of money brings to trade; our greateft difadvantage is, that other Nations, efpecially our industrious neighbours the *Dutch*, are therein wifer than we: for with them, and fo in most Countries with whom we hold commerce, there is not any ufe for money tolerated, above the rate of fix in the hundred; whereby it must of neceffity come to paffe, though they have no other advantages of industry and frugality, that they muft out-trade us; for if they make returne of ten *per centum* they almoft double the Use allowed, and fo make a very gainfull trade. But with us, where ten in the hundred is fo current, it is otherwife; for if we make not above ten we are lofers, and confequently the fame trade being with them and us equally good for the publike, is to the private adventurers loffe-full with us, with them very gainfull.

And where the good of the publike and private mens goe not together, the publike is feldome greatly advanced. And as they out-trade, fo they may afford to under-fell us in the fruits of the earth, which are equally naturall to our and their lands, as to our great fhame wee fee our neighbours the *Dutch* doe, even in our owne Countrey: for in most commodities the earth brings forth, the stocke imployed in planting and managing of them, makes a great (in many the greateft) part of the price; and confequently, their ftocke with them being rated at fix in the hundred, they may with great gaine underfell us, our ftocke with us being rated at ten.

THE CURSE OF LAZINESS DUE TO USURY.

Neither is the high rate of Ufury leffe hurtfull to Commerce within the land, the gaine by Ufury being fo eafie, certaine and extreame great, as they are not onely Merchants and Trades-men, but Landed-men, Farmers, and men of profeffion that grow lazie in their profeffions, and become Ufurers; for the rate of Ufury is the meafure by which all men trade, purchafe, build, plant, or any other wayes bargaine.

Now let us conceive if Ufury were tolerated at fifteene or twenty in the hundred (and I feare many borrowers, all things answered, pay above ten) what the condition of things would then be, and if it appeare how defperate the hurt would be which that would bring: it may (at leaft upon good reafon) perfwade us how great the good would be of calling it down. Certainely, it must of neceffity come to pass, that all Trades would in a fhort time decay; For few or none (and reckon the hazard at nothing), yeeld fo great a gain, as twenty in the hundred & all other Nations might with fo great gaine out-trade and underfel us. For private gaine is the compaffe men generally fayle by.

INTEREST DOTH "BITE" ALL WORKS OF VIRTUE AND PIETY.

If there be any yet fo hearty a well-wifher to ten in the hundred, as that he ftill thinke it fit to be continued, my wifh is, that he and his posterity may have the privilege to borrow, but not to lend at that rate.

In the beginning of this Treatife, I did difclaime the proofes of the unlawfulneffe of Ufury, leaving them to Divines, this one onely (rifing from the premiffes) which may ferve for all, I thinke fit to set downe. It is agreed by all the Divines that ever were, without exception of any, yea and by the ufurers themselves, that biting ufury is unlawfull: now fince it hath bin proved, that ten in the hundred doth bite the landed men, doth bite the poore, doth bite Trade, doth bite the King, in his Customes, doth bite the Fruits of the Land, and most of all, the Land itfelfe, doth bite all works of Piety, of Vertue, and glory to the State, no man can deny, but that ten in the hundred is abfolutely unlawful, howfoever happily a leffer rate may be otherwife.

In the additions to the foregoing tract the author writes:

The great good which the calling downe the ufe for money from ten to eight in the hundred, hath feverall wayes wrought in the Common-wealth, doth encourage mee to recommend this little Treatife upon Ufury this third time to the Preffe.

There are some things in it that doe not fo well fit now as they did to the times wherein they were first written, of which, the Reader will make his judgement accordingly.

This good succeffe doth call upon us not to reft here, but that we bring the ufe for money to a lower rate: Which now, I fuppose will find no oppofition; for all objections which before the Statute, were made againft it, are now answered by the succeffe; and most certainly the benefit will bee every way much greater to the Common-wealth by calling the ufe for money downe from eight to five or fix in the hundred, than it was from calling it downe from ten to eight . . . .

There will likewife be the like advantage in the quickening of trade, for many trades, which are not now looked after, money being at eight in the hundred would be gainfull, and with diligence fought out, if money were at a lower rate.

The land of *Canaan* as I have (received and feene by Maps) did not containe in quantity of ground above the third part as much as *England* and yet as may be well collected from History, *England* hath not the third part fo many people as they had. And for the riches and glory of it, it did exceed all the Nations of the world. Silver was with them as ftones; and all the Nations about them were their Merchants; Certainly, wee are not to understand that this was wrought by the miraculous power of God, but by the wifdom of his Lawes. For all Ufurie being forbidden, and Lands thereby at fo deare a rate, as it was much cheaper to them to improve their owne than to purchase others, there was no means for any man to grow rich, but by his diligence in trade, or by the enriching or multiplying the value of that land (which was the lot of his inheritance) to the highest that any cost or induftry could improve it. By which means it muft of necefsity come to paffe that the whole land muft be made as a Garden, and every place in the Country, that by fcituation was capable of it, bee made a Citie.

And although other States who had not the word of God for their guide, have given way to the practice of Ufury, yet in all times and States, it hath bin cri'd out against as pernitious to Common-wealths, as by History is evident.

1. Notify us at least two weeks in advance.
2. Give both old and new address.
3. Write clearly.

A Word to Mr. Walsh

WITHOUT adding ourselves to the self-appointed advisors of Senator Walsh, whose conduct of the Senatorial investigation has up to this writing shown no sign of weakness, it may be permitted us to advise him how the matter appears to absolutely independent and non-partisan minds out in the country. We feel that out in the country will be found the real United States.

More is transpiring in the matter now engaging the nation than becomes part of the official record of the investigation. Parties are approaching Senator Walsh with suggestions and requests of which he should make careful note. Insofar as this form of side-line play is made known to the public, it involves men of both parties. And its effect is to disclose to the people of the United States that Government is not a selection from the total community of the people, but from a small group, whose friends, sons, employes and beneficiaries make up an organized force designed to seize and use the machinery of the United States Government for their own ends. That is to say, plainly, that while we have been inveighing against a Sovietism of workmen and professional revolutionists, we have fallen into a form of Government composed of a Soviet of lawyers and business men.

Let Senator Walsh add to his service to the country by giving it, at the proper time, a full account of the approaches that have been made to him, from whatever quarter, for the purpose of influencing, in any way whatsoever, his conduct of the investigation. There can be no privacy, no confidential exchanges in such matters. Senator Walsh has been placed by unforeseen circumstances in a position of peculiar usefulness to the whole people. His time is theirs. His business is theirs. The business of his office callers, his telephone callers, is theirs. The affairs of his telegraphic correspondents is theirs. As the net widens and the collusion becomes more apparent—not collusion in leases, but collusion of interest in the people affected by the leases—it becomes more and more necessary that the investigating Senator on the people's behalf forget everything but that he is representative of the plain citizenship of the whole country.

No one can foresee how this affair will end. It is fervently hoped that all officials now charged with responsibility in it will acquit themselves to the full satisfaction of the nation; but it is only fair for those outside the peculiarly vitiating atmosphere of Washington to warn all therein that they must act independently, from President down, with no interest save the facts—all the facts. Facts are not necessarily the full truth. But the full truth can hardly be arrived at without all the facts.

Money—Medium of Exchange

HERE is a thought which may give an idea of the terms Money and Medium of Exchange clearer than some have it.

Almost everybody is familiar with the story of how a single dollar paid one hundred dollars of indebtedness and at the close of the transaction remained in possession of the original holder. That is an example of the multiplied power of the visible representative of the unit of measure of value.

But the same result could be accomplished if the dollar note had not been used, or if none of the crowd possessed one, by the same adjustment of debts.

The story is of a party of friends, each of whom owes another ten dollars. One produces a dollar bill, which makes the circuit ten times, canceling ten times its face and again rests with its first owner. Without the currency a transfer of credits will do the identical work, without use of money or any representative of money. Or, supposing each to have given another his I. O. U. Let these be placed in a pile and then let each draw the one signed by himself. In actual business the Clearing House performs for banks exactly what is done in this imaginary case.

The I. O. U.'s thus cleared by exchange are as truly money as any issued by government or bank, and perform the same duty as a medium of exchange. It is merely an improved system, facilitating all business. Today, coins as money are obsolete, having given way to the better representative—paper. The myth of physical value in a medium of exchange will soon be a memory, for people are more and more realizing it is not necessary; while the use of currency will be confined to small transactions.

Greater freedom in the use of credit expedients, abolition of the tax on circulation and a simple inexpensive means of issue of a legal tender will end all the trouble about money—except perhaps to the usurers, who claim rights and privileges never theirs.

Hurrah! a Mass Meeting!

> "MASS Meetings may be described as the Jews' great American pastime. They are mechanical devices of course; they are not so much expressions of the Jewish mind as they are attempts to impress the non-Jewish mind. There is a great deal of theatrical calculation in them. The mass meeting, it appears, can still be made to seem real to the political official whose vote is sought.
>
> "It was by Mass Meetings that the literacy test was defeated.
>
> "It was by Mass Meetings that every attempt to restrict immigration has been defeated." —*The Dearborn Independent, March 19, 1921.*

The pack is in full cry against the Johnson Immigration Bill, legislation designed to keep from these shores the scum of Europe. The Professional Jew must justify himself, so he is once more active in his ballyhoo against legislation that would curb the influx of undesirables.

And of course there is nothing for the Professional Jew to do but to adopt the tactics he has found in the past to be successful.

"What should we do? What but a mass meeting —a good old mass meeting! We'll show 'em."

And so we read this in the *Jewish Sentinel* of Chicago, for February 29, 1924:

> "Chicago Jewry is obligated to do its share in the strong protest against Mr. Johnson's measure which is now being heard from all sides. WE MUST GET BUSY IMMEDIATELY AND ARRANGE A MONSTER MASS MEETING AT WHICH OUR SENTIMENTS ON THE IMMIGRATION QUESTION SHOULD BE POWERFULLY* PRONOUNCED . . . . Each and every one of us must help kill the Johnson Immigration Bill."

You will note the * after "powerfully" in the foregoing paragraph. We call attention to what we feel was an error in choice of adverbs. Didn't the writer intend to say "noisily"?

Gain—or Loss?

THE passion for statistics leads at times to curious forms of statement. The Brooklyn *Eagle* has a heading: "61,169 Convicted in State Last Year—Gain of 17,466." That is a strange sort of "gain"; is it not a loss rather? This, however, is not a bad record when it is remembered that the state of New York has about 11,000,000 inhabitants, although as a record it would be more complete if the number of arrests and trials were given also; for it is understood that in New York the number of convictions do not at all represent the greater number that should have been made. In some circles a conviction is almost a signal for a riot, so commonplace has evasion of the law become. It is noteworthy that whereas in 1922 there were 10,900 arrests for intoxication, the number of 1923 reached 15,601.

Who Owns the Schools?

THE DEARBORN INDEPENDENT has argued that the taxpayers build and maintain the public schools, against the pending Towner-Sterling Bill and in opposition to bank propaganda that but for the financiers the money required could not be had.

A mother in Washington writes to suggest another phase of the public school question which has led to the selection of the caption of the present offering—Who Owns the Schools? She writes:

> "The enclosed clipping from the Seattle *Post-Intelligencer* came to hand soon after a similar incident in my own household. Then came THE DEARBORN INDEPENDENT (January 26) with the editorial, 'Schools Belong to the People,' in which the following occurs in reference to the Towner-Sterling Bill: 'It is hardly conceivable that the American people, once they understand, will ever permit it to be done.'"

The clipping referred to is a special telegram from Yakima which says that "twelve high school students have been barred from the school for failure to attain scholastic standards set by the faculty. The school board recently authorized such a policy at the principal's suggestion. Parents of some of the students have been informed by the prosecuting attorney they have no recourse in the courts."

That a dozen students should be mentally unfitted to remain in school is hardly to be credited, and as a principle of general application the policy is a violation of individual rights, against which Americans should maintain a jealous opposition.

While this case does not fall within the points against the Towner-Sterling Bill, heretofore discussed, it is well within the province of that proposed law. The public schools are among the last of real home institutions, and must be preserved to the people. Boards of education are not chosen and teachers are not employed to make selection among the children within their respective jurisdictions for teaching, and no child, even if subnormal, may be deprived of school training or its equivalent in special instruction.

It is not always the boy or girl who attains a scholastic standing set by a faddist principal or faculty who makes the best scholar. Many a diligent student has been hindered in his work by a well-intending but incapable teacher.

The principle involved in this is whether the school, the public school, is for the benefit of the people, or the convenience of those employed to give instruction. Are the laws of Washington such that twelve pupils may be barred from further opportunity at the will of a principal? The cost of public schools is the highest single item in the tax budget and with every fad introduced into the curriculum it increases. Directed play, outside pageants, theatrical exhibitions make the pupil in many cases an overworked individual, whose mentality is handicapped by giving attention to the steps in a marching figure where a score must keep in absolute unison or "spoil the act."

Parents must be aroused to the necessity of constant watchfulness lest school boards, principals and teachers become too firmly convinced they, instead of the taxpayers, own the schools.

Rumblings

EUROPE awaits another Sarajevo incident, another excuse to spring to arms. One country has eight poison-gas factories, another eleven. An accident in a Dresden military laboratory cost the lives of seven workers who were experimenting with a new poison gas developed during the last few months for the German army. This gas is odorless, colorless and tasteless, all of which will add to its deadly effectiveness in war.

Marconi, the famous Italian inventor, has succeeded in harnessing the waves set in motion by radio energy, concentrating and directing electrical waves much as light is controlled and directed in a searchlight. The fearful possibilities of this new weapon will be known when excessively high power is put behind a radio beam directed at a powder magazine many miles distant.

In the next war there will be no non-combatants. It is said that today 25 airplanes flying across New York City could, within three hours, suffocate every inhabitant.

Unless European countries learn to live side by side in peace and understanding as have Canada and the United States the future is indeed dark.

Golden Rule Is Unknown in Central Europe

Peacemakers at Versailles Who Created New Countries Forgot About Economic Interdependence and Chaos Has Resulted

By SAMUEL CROWTHER

THE present Austria is easily the prize production of the peace. In the last article we saw what a mess had been made by giving Rumania too much land and Hungary too little. The advertised principle upon which the map of Europe was redrawn concerned self-determination—that is, people who spoke the same language or had the same racial stock were to be set up in separate countries of their own and all were to be happy.

Especially the big, sprawling Austro-Hungarian empire, which had grown through the years by capturing and adding to its territories weak little nations, was to be broken up into its original parts. It all worked out well enough on paper. It worked out well in Paris when the political delegations of all these little nationalities brought in their plans. France and Italy had no love for the old Hapsburg Empire; they wanted to see it broken up—to perish for its many sins. Also they wanted to break up Germany. Therefore Clemenceau became an ardent advocate of the rights of the small nations, and it all seemed so just and right that the American delegates fell in with the scheme.

The Peace Council cut Austria down from 260,000 to 33 000 square miles and gave the pieces to various candidates. What Rumania got has already been told. The finest industrial region was cut off and called Czecho-Slovakia; another section was joined to a big slice from Germany and called Poland, and republics were set up, and all seemed lovely. It never entered the minds of the American delegates that they were doing other than a belated act of justice—helping some small nations to do peaceably what we had done by force of arms in 1776. For if Germany and Austria had been disturbers of the peace in the past, was it not a good idea, in addition to doing justice, also to make these countries impotent for war in the future?

All Wanted To Be "Free"

BUT in these days nations are prosperous only as they are economic units. That which has made the United States a thoroughly going concern is not the liberties guaranteed in the Constitution but the insignificant clause about which no one talks—the prohibition against states levying import and export duties. The old Austrian Empire was not a political unit at all; it had within it dozens of nationalities, and all of them wanted to be free. It was always on the verge of going to pieces and it had a hard-boiled, reactionary government which stayed in power only through an ability to play one section against another. But it was an interdependent economic unit and when the peace delegates cut up this unit in cavalier fashion they started a train of economic consequences which have probably done more harm than the war itself.

We think of freedom as something fine; I found freedom as interpreted in the new countries of Central Europe a very sordid thing which had to do mostly with getting on a public pay roll or with oppressing some one. The Golden Rule is suspended by common consent; perhaps it never did work actively out here. Anyhow, the main point now is to do to someone whatever that someone did to you in the past and with a little interest added. None of the nations which were newly created are today happy or prosperous—except when out looking for a loan. Everybody is worse off than before. The period of rejoicing over freedom is past; the people have realized—although the politicians will not admit—that freedom is something different from what it was supposed to be. The freedom is getting around to be the freedom to starve—not to live.

Austria the Most Pitiable

THE new states are not prosperous, but the remnant of old Austria is the most pitiable sight in Europe. Budapest is poor and proud; Vienna is just poor. Austria is a broken-down old man—a shabby, genteel individual who has scraped along on money borrowed from friends—and is now an official ward of the League of Nations. And since the League of Nations is in the nature of a partisan subject, so Austria as an exhibition of what the League can do is a partisan subject. I learned from League addicts that Austria had been saved. What disturbed me was discovering that the Austrians themselves, although exceedingly grateful for having been saved, could not quite tell the difference between being saved and not being saved.

You can get an idea of what happened to Austria by considering the United States. Big cities are not just built—they grow because of some good reason. Vienna was to Europe what Chicago is to the United States. The railroad lines east and west and north and south pass through Vienna. It is on the Danube, the big artery of Europe. In the old days the caravans came through Vienna. Once it was the outpost against the Turks. It grew up as the inland trading center of Europe and it built hotels and palaces. The banks centered there as they have centered in New York and Chicago. The buyers came there to buy. The manufacturers all had their head offices and show rooms in Vienna. Also it became the center of the clothing industry. The country surrounding the city had no raw materials to speak of, but it was the central point for their delivery and many factories grew up—particularly those for finishing or assembling. Its leather work was famous but it bought its hides from Galicia, Bohemia, Hungary, and Croatia; the wool came from Galicia and Hungary, tobacco from Bosnia, coal from what is now Czecho-Slovakia, oil from Galicia, and so on. Except cotton, the old empire had nearly all the raw materials it worked with somewhere in its wide borders. Vienna grew to two million people and it was easily the most beautiful city in the world, and still is.

Nationalism Goes Wild

THEN the treaty cut off every source of supply in the old territory; instead of fifty million people, Austria had seven million, and two million of those were in Vienna. This might not have mattered had the new divisions been merely political; but the first acts of the new countries were to set up high tariff walls and all sorts of bureaucratic regulations. Nationalism went wild. The result was just as though Cook County were shut off from the United States and then expected to support the city of Chicago. The industries had to close down, for they could not get raw materials. For instance, the new boundaries cut right through the textile trade, leaving the spinning and finishing in Austria and the weaving in Czecho-Slovakia.

And worse than all, the new Austria could supply only one-fifth of its foodstuffs. It had to buy the remainder outside and pay real money for them. It did not have the money. The officials of the old empire mostly returned to Vienna and this little country found itself with a public pay roll of three hundred thousand.

In some way or other, one out of every six inhabitants was being supported by the others. Of course the country had a revolution which brought in a great number of "social reforms." These consisted mostly of restricting the hours of labor from ten to eight without any compensating machinery, and in controlling the prices of foodstuffs. The Socialists put in rent controls which soon, with the fall of the krone, made rent a trivial expense. A good-sized room and kitchen, such as the average workingman occupies, used to rent for ninety kronen or eighteen dollars a quarter; now the same rooms rent for 20,800 kronen, but this is only thirty cents! Living quarters are allotted, for of course there can be no building and the whole item of rent has dropped out of the national income—and practically out of the family budget. The Socialists put in many other measures for shop controls, but since these are not unlike those in force in Germany I shall describe them later.

Everyone is familiar with what happened to the professional classes in all this debacle; for a while the workingman was on top, but that was only because the government was borrowing money and giving it to him in food or subsidies. In the three years to 1921 the government borrowed forty-eight millions of dollars and of this sum sixteen millions came from the United States. Remember, this money was borrowed, not to repair the ravages of war, but to perpetuate the mistakes of the peace. Finally the country came to the end of its rope.

Then Chancellor Seipel went to Prague to inform the Slovaks that he would have to conclude a treaty putting Austria into Italy, and a little later he traveled down to Rome to let Italy know that he expected Austria to become a part of Czecho-Slovakia. His scheme worked. Both countries suggested that this was a case for the League of Nations and in due season the League appointed a receiver for the country in the person of a Dutchman, named Zimmerman, who had been mayor of Rotterdam.

100,000 Off Pay Roll

HE IS charged with seeing that Austria cuts one hundred thousand persons off the pay roll, and also he supervises the tobacco monopoly and the collection of the customs and export duties. On the strength of this receivership, Austria has been loaned one hundred and twenty-five million dollars at seven per cent—which is enough to pay the expenses of the government for two years and thus to stop printing money. That is all the loan does—it pays the expenses of government. It has nothing to do with the rehabilitating of commerce and it cannot touch the real cause of the trouble—the fact that Vienna is a workshop without raw materials or customers. The loan gives a breathing spell and perhaps before it is exhausted the trade arrangements will be made by which the country can be saved. To date Austria is not saved, for its malady is one that cannot be cured by money.

The principal hope of Austria is Czecho-Slovakia and also the principal hope of Czecho-Slovakia is Austria, for this new republic, headed by a college professor, is a factory without a sales force. Czecho-Slovakia has had more advertising than any country in Europe. It has a fairly big man in President Masaryk—the man who founded the republic long before the war was over. I say "fairly big" because it is as a liberator rather than as an administrator that this former professor of philosophy did his best work. For years he worked for a republic and that republic came into being in Paris in October, 1918, before it had a country. In the peace negotiations Professor Masaryk argued to such good purpose that he secured an allotment of territory which included eighty-five per cent of the industries of the old empire. He got the richest bit of land in Europe, with factories and farms and forests. In an area of 35,000 square miles there is only four per cent of waste ground. But instead of getting prosperity out of all this wealth, the country to date has had only poverty.

The strong man of the country, the practical administrator, is Doctor Benes—also an ex-professor. Everything ought to work but it does not, and the reasons are not far to seek. You know why ten minutes after landing in Prague. For while Prague is a fine old city with many beautiful buildings and a peculiar quaintness, it is easily the most inept city in the world. The people take freedom as the right to be rude. I asked an American who had lived there many years whether I just imagined that the people were rude and also inefficient—telling him that among other things it had taken more than an hour to cash a small draft on a letter of credit.

Just Rude, That's All

"NO," he answered, "they are rude. They try to make up for a lack of knowledge by being boorish. They have, as you have noticed, taken down all the German street signs and put up Slovak signs. The people take it as a matter of pride not to speak any foreign language. The hotels are bad. It is an uncomfortable city to live in and it must be a frightful city to visit. And yet these people expect the world, which used to go to Vienna and buy the goods made here, to come to Prague and be miserable. It is just nationalism gone to seed."

That, of course, is only a small part of the story. The setting up of a new republic required the opening of many offices for the faithful. These faithful proceeded to tax everything in sight. They replaced Austrian managers of industry with inexperienced natives. They shut out the Austrian banks which had formerly done all the financing. They expected things to go on as they had done before and of course they did not.

In addition, the Finance Minister deflated the currency with great suddenness. Deflating currency, like deflating any other boom, always brings distress, for people must pay their bills in money that is worth more than was the money at the time the debt was contracted. The heavy taxes made prices too high for export and a long system of export duties and licenses made it still harder to trade. The result has been unemployment in a high degree, and what ought to be the most prosperous country in Europe has had a tremendous record of commercial failures and an ominous unemployment.

Bit of Sanity Returns

NOW the politicians are slowly beginning to see the light and are putting away some of the toys of nationalism and trying to get to work in a sane way. They are being enlightened as to what freedom really is. Incidentally, their industries are passing out of their hands into the hands of the French, the English, and the Austrians, and the Austrian banks are again coming into power.

In many respects Poland started off as well as did Czecho-Slovakia, although without the resources of that country, but Poland today is but a bankrupt outpost of the French against the Russians on the one hand and the Germans on the other. It is a country with an army and with almost nothing else. The fear is that Germany and Russia may get together. The barrier between Russia and Germany is Poland, and hence the Polish army has been trained, equipped, and kept up by the French. What money it can borrow must be spent for munitions in France. It cannot borrow enough to pay for the army and the civil servants. The man who is not in the government pay in Poland considers himself as wronged. And since the revenues as compared with the expenditures are insignificant the only way to keep the show going is through the printing of money. And so they have printed money. What will become of Poland is one of the most interesting questions in Europe and one that I found no one to answer.

Real Spirit of Co-operation Found in Finland

Farmers and Consumers Work Out Respective Problems Successfully; First Organized Twenty-five Years Ago, Societies Become Very Strong

By HUSTON THOMPSON

FINLAND is the land of the water cooler. After passing through what we Americans would term "wet" countries, "dry" Finland with its American type of water coolers in every office and hotel room, reminded one of home. On my arrival at Helsingfors the Finnish capital, I was informed that the second largest hotel in the city had recently been closed for two months because it permitted the prohibition law to be forgotten. Along Finland's coast, I saw familiar sights of bootlegging vessels, maneuvering at sea waiting for an opportunity of getting in under cover of darkness.

I had pegged Finland—the most distant country of my travel in the survey of the co-operative movement—for a visit because the Finns in the United States have the reputation of being our most successful co-operators.

Leaving Stockholm we sailed toward the sea in the twilight of the North that lasts until after twelve o'clock, passing islands so close that it seemed as if we could reach them with a stone's throw. The approach to Äbo with its Russian-like atmosphere is a complete change from Stockholm. The entire civilization seems to be cast in a different mold. The people are shorter and said to be of Mongolian extraction. The droshkies and their drivers, and the whole surroundings bear the marks of Russia.

Äbo is an old city, and was for a time Finland's capital. It was the seat of Finland's university which was subsequently moved to Helsingfors. It is the western distributing point for the co-operatives with warehouses and many local stores.

"Live Upon the Rocks"

AFTER looking these over we took the train for Helsingfors which is about six hours' ride to the east. In the compartment we were fortunate in having with us the Finnish Minister to the United States who was returning to his country for a short vacation. I compared the soil of Western Finland with that which I had seen in Sweden and Denmark and said that it seemed to me that while it had the appearance of being fairly rich, it was very shallow and had a rocky base.

"Yes," said the minister, "the Finns live upon the rocks."

"Well," I replied, as we observed the apparently trackless forests on both sides of the roadbed, and saw the piles of lumber along the way ready for the market and the wood pulp plants, "you might add that the Finn not only lives upon the rocks but upon the trees."

In spite of the shallow soil and the forests much is claimed for the richness of the earth by those interested in farming. Undoubtedly it has been fertilized for many years by the leaves, the needles and the cones that have fallen from the trees. It was of a rich brown color as we saw it upturned by laborers in the fields, many of whom were stripped to the waist and tanned the color of leather by the fierce heat of the sun that beats down in the short but intensive Finnish summer.

As we approached Helsingfors a debate broke out in our compartment as to the reason for the co-operative instinct and success of the Finn. The area of his country is about the size of Montana, with 144,257 square miles, of which 16,212 square miles are occupied by lakes and rivers. There are only about three million six hundred thousand inhabitants in the entire country. The northern part, which comprises the territory known as Lapland, is very sparsely inhabited.

Suppressed, Kept Culture

PERHAPS the unified processes of thinking along national, spiritual and somewhat identical lines of this quiet, persistent and unusual race were brought about by the years of suppression of their national desires by Swedish culture which dominated them for a long time and by Russia which controlled them until 1918, they having been a part of that empire under the name of the Grand Duchy of Finland for many years. There had, however, been at all times a universal determination to keep their culture and language alive, although under the surveillance and force exercised by the Russian bear. I was told in Helsingfors that in the days of Russian control, it was considered almost a disgrace for a Finnish girl to pass her examination in the Russian language in the schools. This was possibly an exaggeration.

The Finns one sees along the railroads, in the small towns, in the parks and in cities like Äbo and Helsingfors, bear a very striking resemblance to each other and can be easily distinguished from the Swedes who live in Finland.

In addition to the Russian suppression, usury had for years reared its ugly head among the farmers and some of the townspeople. The peasants had been in a chronic state of debt. In recent years there has been chaos due to the Bolsheviki uprising. During this period, the farmers and the co-operative organizations have been whipsawed back and forth with their properties frequently destroyed, the co-operative plants burned and the public mind kept in a state of constant ferment. During the Reds' sway, they robbed the Consumers' Co-operatives of many millions of dollars, killed two of their staff and for a long time all their board of directors had to conceal themselves from public view.

But Finnish spirit is like an athlete who has had a long refreshing sleep and suddenly awakens prepared for action. Today Finland is beyond any question on a permanent basis, despite the fact that she has to take the Communist in hand from time to time. Her parliament is strongly agrarian. Her farming population greatly exceeds the residents of the cities and what is most important the farmers own their own soil. It was this that made them fight with such desperation against the Reds. It is this that has given them a well-prepared militia who devote a part of their year to training for the defense of their land and who will fight for it to the last man.

Americans Can Learn

IT MAY be that the Finnish instinct for co-operation lies in the fact that there is a remarkable equality of classes among the Finns. They have a motto in the remote parts of Finland—"Every man is as good as his neighbor"—and they do not yield on this point.

I particularly stress these suggested causes for this instinctive co-operative spirit among the Finns because in America there are those who are hurrying to and fro in the market place asserting that you can form a successful co-operative movement based solely on the proposition of a return of larger profits than through individual enterprise. According to experiences in Europe a co-operative system based solely on profits will have no more strength than a rope of sand and will mean, as it has in the past in America, failure on the part of many co-operative movements.

Basic requirements for success, such as economic pressure producing a common necessity in a group, similarity of thought among the members, like spiritual aspirations, a maximum requirement of intelligence, and individual possession of the soil, are things that must be taken into account as the foundation stones upon which to build a successful co-operative society.

In their possession of these undoubtedly lies the answer as to why the Finns have the most natural co-operative instinct of any race.

If individual land ownership is one of the requisites for universally successful agricultural co-operation, then do we in America have all the requirements? According to recent authoritative figures from the Institute for Research in Land Economics, more than thirty-eight per cent of the farms in the United States are operated by tenant farmers and undoubtedly this number is on the increase.

The Finnish people date their co-operative movement back to 1899, though, of course, there were as in Sweden many unsuccessful efforts prior to that time. But apparently the Finn was ready to arise and go forward under the guidance of proper leadership, and when the hour struck, the man appeared in the person of Professor Hannes Gebhard who is today known as the father of Finnish co-operation.

Saturated with the knowledge of the experiences of Sir Horace Plunkett in Ireland in his efforts to further co-operation there, Professor Gebhard played a like part in Finland. Starting out to arouse and combine the Finnish peasantry he took as his text of co-operation, the words of the poet Z. Topelias, who said:

"We are nothing in ourselves. We are nothing by ourselves, but we are strong indeed when we are united in co-operation for the common end and in an honest endeavor, so far as in us lies, to further the work of centuries." To this he added the expression of the famous Finnish scholar, M. A. Castrem, who uttered the following thought: "Whenever men work for themselves, little is done, but whenever thousands have a common endeavor a mighty building is erected before long."

Only Twenty-five Years Old

PREACHING this doctrine, Professor Gebhard and his associates have seen the movement grow from practically nothing in 1899 to a position where today out of a population of three million six hundred thousand, the co-operative movement claims four hundred thousand families. This means that with an average of five in a family, two million are connected with this great movement.

In Helsingfors, with a population of two hundred thousand, there are thirty-five thousand families in the co-operative fold, which means that the movement in one form or another touches almost every person. Here we have a great difference in the Consumers' Co-operative movement from that found in England where only the artisan class belongs to the Consumers' Co-operatives. We were told at Helsingfors that the membership of the Consumers' Co-operatives contains persons from all classes, indicating that the instinct for co-operation in Finland is more universal than in England, despite the success of her gigantic Consumers' Co-operative organization.

While the northern part of Finland does not contain many co-operatives, particularly in its forested territory, yet in the middle and lower sections of Finland, where the population is also frequently sparse, co-operation has met with success. In fact, the Finn, after a thorough survey and study, has figured it out that a Consumers' Co-operative store can be successfully carried on with a minimum of two hundred members and a turnover of approximately $10,000. These figures should excite the attention of those in our country who previously thought that the Consumers' Co-operative movement must be confined only to congested areas in our cities.

The outstanding glory of the Finnish Co-operative movement is that it has been able to co-ordinate the efforts of the Consumers' Co-operative associations who seek only to supply their members with their needs and the farmers' agricultural co-operatives which sell the products of the farm at the best prices obtainable.

I was told by one of the members of the Finnish Co-operative Wholesale Society, the organization that does the buying for the consumers' societies, that while his society had a department devoted to teaching and organizing co-operative societies, it contributed a certain sum of money every year to the Pellervo Society which serves the same purposes for the farmers' organizations. In fact, he said that his society had established local societies throughout Finland and near enough for the farmers to use them, a step in advance of what has been accomplished by the consumers' societies in some other countries where they are largely confined to congested populations.

How It Works for Farmer

TODAY, the farmer of Finland buys the needs of his family from the consumers' societies and the needs of his animals and the soil for producing a crop from the farmers' agricultural societies. In addition to this he sells his products in the domestic market through these agricultural societies. His export products such as butter and cheese are sold almost entirely through the Co-operative Butter Export Association, which has a plant located in Helsingfors.

My Finnish friends had difficulty in grasping my query as to whether they had a separate woman's organization in which woman would be educated along co-operative lines. With them woman has not only the ballot but is encouraged to higher education just as much as is man and everywhere one goes in the university towns one sees young ladies wearing hats indicative of university life as frequently as one sees men wearing them. The idea of a separate grouping for the women was so foreign to them that my suggestion while causing merriment and surprise created no other interest.

The Finnish co-operative instinct is also revealed in the number of things which the Finn does in a co-operative way. He deposits his money in co-operative banks, combines in threshing machines, peat moss, telephone, land purchasing, forestry, sawmill and housing societies. He is also associated with other farmers in the sale of cattle, eggs, milk, corn and fish. He manufactures brushes, saws, working clothes and underclothes, roasts coffee, cleanses and packs fruit, and has fought a successful fight against the match trust to the point where he has now developed a tremendous match industry. Indeed I was told that he is preparing to build dams on the streams to create electric power with which to run his plants and light his house.

The Finnish Arguments

I SUGGESTED to representatives of the consumers' societies that those organizations of the farmer which sold his products were in the words of an advocate of the consumers' societies in England "only pseudo co-operative societies with a selfish aim." To provoke a reply, I summed up all the arguments that had been made to me against this type of society.

They replied that Finland was a peasant nation and so dependent on her farmers that if they were not successful the nation would not be. They did not fear high prices on the farmer's part for he was either a member of a consumers' co-operative, or the latter was strong enough to deal on an equality with him and his selling society. If the occasion should arise, then foreign competition from Sweden, Esthonia or Russia, when it got back on its feet, would check his prices.

This broad-minded view on the part of the consumers' societies has won the farmer's good will and has caused him to join them wherever it is possible to purchase his family's personal needs. According to the latest reports I could get there are 620 stores scattered over Finland where the farmer or city member may purchase, and approximately one million six hundred and twenty thousand persons have recourse to them.

There are also co-operative credit societies or rural banks to the number of 775. There are 762 co-operative dairies which ship the greater part of their butter and cheese through the Co-operative Butter Export Association.

The agricultural co-operative wholesale society, which

The Covered Wagon on a New Expedition

Caravan to Move Down Pennsylvania Avenue in Interest of Economy and Lower Taxes

By EMERSON ROBINSON

FRED KOHLER, former Mayor of Cleveland.

CONGRESS soon will have brought graphically to its attention the demand of the folks back home for a reduction of taxes.

On some morning in the not-far-distant future, it is expected, the greatest caravan of covered wagons ever assembled in the history of North America will carry the messages of the people direct to their representatives.

Late sleepers in hotels, homes and apartment houses along Pennsylvania Avenue in Washington may look from their bedroom windows and may well wonder if they are not in the aftermath of a dream, visualizing a scene of three-quarters of a century ago. But they will not be. They will be onlookers in the most unusual attempt of a levy-burdened nation to get relief.

Hundreds, perhaps thousands, of prairie schooners will make the trip down Pennsylvania Avenue to the Capitol. They will be horse-drawn and the horses will be driven by members of farm bureaus and granges, and in the wagons will be petitions of hundreds of thousands urging Congress to cut politics and work for the people.

On the wagons will be this legend:

Let's Go Back to the Ways of Our Fathers
Simplicity
Honesty in Government
Economy

On the first of the double span of horses will be this sign

Get in the Fight for Lower Taxes

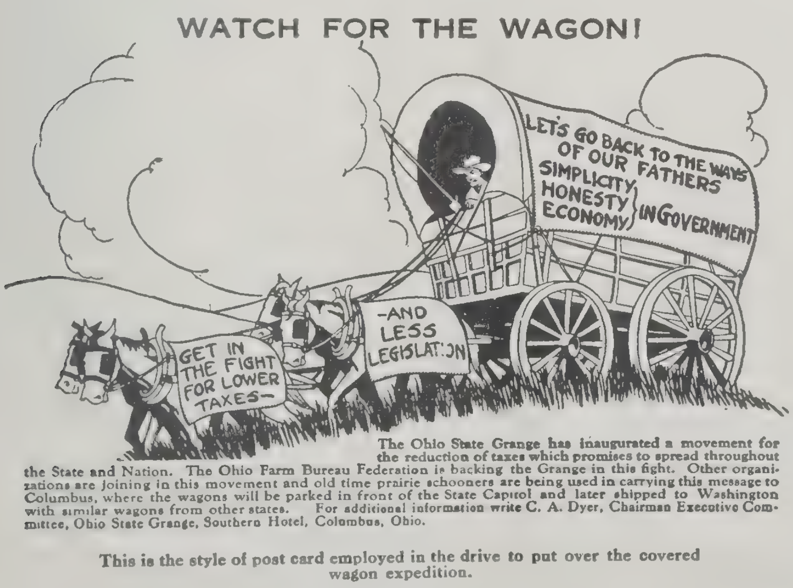
And on the second span

—AND LESS LEGISLATION.

The movement thus to bring direct to the attention of Congress the attitude of the voters toward taxation and economy originated in Ohio. It is the idea of C. A. Dyer, overseer of the Ohio State Grange and chairman of the executive committee. Mr. Dyer is an expert on taxation and he has fought many battles in Ohio. He's lost a good many of his battles because Ohio is a state which has rejected any radical reform in its taxation system. But he's still plodding on and he is living in hopes that even that state will reform in course of time. Originally the plan of the covered wagon merely included tours of Ohio, but its wide appeal gathered momentum as soon as it was announced, and Mr. Dyer has been working night and day and on holidays and Sundays trying to keep up with the demand for information and offers of local granges to help.

He already has received assurances from Michigan, Kansas, Wisconsin and New York to join in the covered wagon parade and has been forced to place a limit on the number of wagons for each state.

"There will be thousands of them," said Mr. Dyer. "Literally thousands and we hope to impress on Congress the necessity of abolishing the pork barrel and getting down to brass tacks in the operation of the government



The Ohio State Grange has inaugurated a movement for the reduction of taxes which promises to spread throughout the State and Nation. The Ohio Farm Bureau Federation is backing the Grange in this fight. Other organizations are joining in this movement and old time prairie schooners are being used in carrying this message to Columbus, where the wagons will be parked in front of the State Capitol and later shipped to Washington with similar wagons from other states. For additional information write C. A. Dyer, Chairman Executive Committee, Ohio State Grange, Southern Hotel, Columbus, Ohio.

This is the style of post card employed in the drive to put over the covered wagon expedition.

"We are simply trying to save the $323,000,000 surplus at Washington, both for this year and the years to come, and are of the opinion that if we can start a real movement for economy in the fountainhead of government, it will be easy to extend it to the states. In Ohio our fight right now is to preserve the Griswold debt law and write its provisions in the constitution. Ohio outranks all the states in debt and we can get better conditions in this state only when we control debt and force the payment of some of the debts we now have."

The prairie schooner "business," Mr. Dyer says, has developed so rapidly that he has had little time for anything else. The idea made an instant appeal to Ohio and although the state had not been traversed to any great extent, more than 50,000 signatures to petitions were obtained in a few days. They will pass through various parts of the state, being drawn from city to city by horses, use of which is being donated by members of granges and farm bureaus.

At Youngstown, the first city visited by the first schooner, thousands braved a downpour of rain to watch the strange procession of a covered wagon—a replica of those used on the western plains—go down the city streets, trailed slowly by a large number of automobiles. The school band gave a concert and gigantic streamers carried by children urged: "Don't pass your debts on to us," and "Let each generation shoulder its own burden."

Mr. Dyer was the chief speaker, as at meetings in other towns, and called attention to the burden which taxpayers are forced to bear.

"Of every twelve persons gainfully employed," he said, "eleven must work to support the twelfth in a government position. Expansion of the ordinary affairs of government and the addition of any number of paternalistic schemes has raised our rate, making our burdens even more heavy than those of certain countries in Europe."

One of the ardent backers of the plan is Governor Donahey, of Ohio. He not only accompanied one of the wagons between cities but he drove one of them up High street, the principal thoroughfare in Ohio's capital, Columbus, and addressed a huge crowd on the subject of taxation.

The idea not only has attracted the attention of the small taxpayer but of the large taxpayer as well, and when the wagons arrive in Washington and are driven to the Capitol, Congress may get the surprise of its life by taking careful note of some of the great taxpaying interests represented. One of the greatest railroad companies in the nation and also one of the heaviest contributors to the coffers of the government, has offered to transport free of charge as many wagons as can be got together in Ohio and other states.

They will, except in a few instances, be so transported and horses will be obtained in and around Washington to haul them down Pennsylvania Avenue.

The great increase in public debt seems at last to have aroused officials, or some of them, at least, to the error of their ways. For some communities, it would seem, the lessons may come too late.

From Columbus, Ohio, goes the warning of Joseph B. Tracy, auditor of state, that a large number of taxing districts in his state face absolute bankruptcy within a few years unless they take immediate steps to curb public debt. In his annual report he cites the fact that nearly half of all the taxes collected must go into the coffers of the sinking fund trustees to meet maturing bonds and interest.

The total indebtedness in the state at the end of the fiscal year was $760,589,834. It probably is close to $800,000,000 at this time and more than half of it is owned by the various municipalities. Practically all of this debt has been created since 1910 and was due largely to a policy of limiting taxation but not limiting debt, forced by interests engaged in floating bond issues, and practiced by public officials more interested in spending money than practicing economy.

In West Virginia they are paying out nearly six dollars a year for every resident, man, woman and child, for interest and retirement of obligations. It has become so critical there that it will be the chief issue in the coming campaign, as it promises to be the issue in other states, as well as the nation.

That it is not altogether the fault of the laws, however, that Ohio cities are in their present dilemma, is shown in an annual report of Fred Kohler, who served as mayor of Cleveland.

Many people in Cleveland don't like Mr. Kohler and many others do. He formerly was chief of police and evidently a good one, with an eye to the "big chance," for when he became mayor two years ago he knew the political hangers-on and the excess baggage on the city's pay roll. He used the pruning knife without prejudice to the taxpayers, an unusual thing in municipal government. Mayor Kohler has lost his job now because Cleveland has decided to accept the city-manager form of government, and it is reported that he will seek the nomination of one of the major parties for the governorship.

Before he retired, however, Mayor Kohler took a few parting shots in a report which sizzled, in condemnation of public officials who spend recklessly, and he gives these figures on the financial condition of Cleveland:

That on December 31, 1920, Cleveland had a cash deficit of $926,000; on December 31, 1921, a cash deficit of $892,000.

In those two years he was not mayor and he compares those deficits to his cash balance of $558,000 for the year ending December 31, 1922, and a cash balance of $1,800,000 for the year just closing.

Cities can live within their incomes if they are so minded, he says.

Commenting on this accomplishment the mayor says:

"At the same time, no city activity or function has been neglected. On the contrary, more public improvements have been made than ever before in the history of Cleveland. More work has been actually accomplished.

"The whole machinery of the city's government is running at higher efficiency and at less cost than ever before. The physical condition of the city's property is better than at any time in the city's history. While we have lived well within our income—at no sacrifice of public service—during the past year, we have further reduced our pay rolls from last year to a figure nearer to what they should be and there is still room for improvement in further reduction of the number of assistants and in adjustment of salaries.

"Of course this has not been entirely satisfactory to a lot of politicians and particularly to the political ward heelers who in years past have found the city's pay roll a convenient feed box. Neither has it been entirely satisfactory to sundry friends of assorted politicians who have been in the habit of grabbing off soft city contracts and certain privileges at fancy prices. But it has been pretty satisfactory to the taxpayers and rent-payers who were being gouged for more money each year so that the tax-spending politician could keep his political machinery well greased.

"All this is in striking contrast with our neighboring cities of Ohio where they are now paying the penalty of political extravagance in the serious curtailment and actual stoppage of highly important municipal functions involving the convenience, safety and, in some cases, the actual lives of inhabitants."

Discussing the city's heavy indebtedness, the last bond of which falls due in 1974, fifty years from now, the mayor says:

"But . . . . it might be of interest to point out that of the $17,000,000 in bonds that come due and must be paid by the city in 1927 and 1928, $12,750,000 is the city's heritage from the deficiency administrations of 1919 and 1920, during which two years bonds in that sum were issued and sold to pay *running expenses* of the city in excess of the large income provided by the regular tax levy which should have been sufficient."

The path of a mayor is never entirely strewn with roses; there are usually some rough spots, but it is evident that Kohler's path was strewn with thorns and many of them. Two petitions for recall were circulated against him but both were thrown out.

And while Cleveland under Kohler has been laying away money for the rainy day when there will be a deluge of bonds and interest due, Cincinnati, second largest city in Ohio, has awakened; rather, it would be more proper to say that some of her foremost citizens and some officials have awakened. It is seeking expert advice and has announced the employment of L. D. Upson, a municipal expert of national reputation. He will have assistants and the report is anticipated to show exactly where Cincinnati stands.

The covered wagon caravan may have the effect in a spectacular way of bringing to the attention of Congress the attitude of the people who pay the bills toward an extravagant government; it should have the effect of centering interest of the lethargic voter on the necessity of vigilance in the selection of his officials.

The Exploitation of Our Cut-over Lands

Concluded from page 3

down the small trees. He burns the rubbish thus accumulated and puts in a crop of potatoes. If he plants hardwood land his crop is assured. He usually raises from 200 to 250 bushels of potatoes the first year. The hardwood stumps will rot out in a few years and he will have a cleared field. That is the most successful method.

The Upper Peninsula Development Bureau, in Michigan, estimates that there are very nearly sufficient farms in the Northern Peninsula of Michigan to make the country self-supporting. The majority of farm crops, with the exception of corn, can be raised successfully in the northern parts of the Lake states. Usually the snow comes early, and the ground does not freeze. If it does freeze early in the autumn, or a heavy blanket of snow three to four feet deep falls in the wintertime, you can plant potatoes in the autumn and they will come up in the spring. This method of planting is not generally practiced, but there is frequently volunteer growth made in old potato patches where seed has been left.

The problem of the cut-over pine lands is a serious one. Wisconsin has four million or more acres of land that is too poor to be considered from the standpoint of agricultural value. Michigan has thousands of acres reverting to the commonwealth annually because of non-payment of taxes. During 1922 fully 42,000 acres reverted to the state through this source. At least sixty per cent of these lands were unfit for agricultural purposes, according to state officials. Minnesota has millions of acres unfit for agricultural purposes and the governor of that state says there are many sections of Minnesota where people ought not to be permitted to go and live by farming, because they will be doomed to disappointment.

That portion of the Lake states which produced pine timber is fit only for the growing of timber and as a recreational region. Any land that has produced white pine—the stumps are standing there today—three and four feet in diameter, will produce white pine again. But as an agricultural venture the settlement of these pine barrens has proved a failure. No material good is accomplished by forcing lands into use which ordinarily would not be cultivated until pressure of food requirements makes their cultivation profitable. It would require very intelligent cultivation by the settler to produce anything of value on these lands in one season. A timber crop requiring from eighty to two hundred years to mature would be feasible. This land in white pine, matured timber, would be worth thousands of dollars an acre at maturity. As it is now, it is valueless.

Old growth Norway pine.

The bane of the land settlement business in these cut-over regions lies in the fact that competition for a limited number of buyers compels resort to heavy advertising and selling outlay on the part of the sellers. This, in turn, burdens the land with more overhead costs than the land can carry profitably.

This fact makes it difficult even for land settlement companies of the highest character to give settlers as good a chance of success as their enterprise merits.

In 1914 the tourist business in Michigan alone was worth $5,000,000; in 1921 it was estimated as being worth $100,000,000. It increased twenty times in those seven years and I believe it has only begun. New communities are being built up about the numerous inland lakes by the tourists from the southern states. Taxable values are being created and the country is being built up to a certain extent in the waterways.

The only solution of the land problem in the cut-over pine sections of the Lake states is reforestation, either by the government or by private initiative. Taxes on the growing timber must be adjusted to give the grower a fair return on his investment, which necessarily is of a long-term nature. Timber is the only crop that can be successfully grown on the pine lands, where recurring fires have destroyed the humus in the soil.

Are Women's Clubs "Used" by Bolshevists?

Concluded from page 2

illegally or semi-legally; the party should organize an illegal apparatus for work among women. In all legal bodies there must be at least one party member to organize the women for illegal work."

Sara Bard Field, one of the foremost leaders of the National Women's Party, was chosen with Jane Addams to make the presentation speech of the three suffrage statutes to Congress in 1921.

Miss Field addressed the Speaker of the House of Representatives thus: "Mr. Speaker, I give you revolution!" On February 12, 1922, Miss Field, in a letter to Brigadier General Ames A. Fries, says, "I have no confidence in anything short of revolution. Peaceful by all means, if possible; bloody, if necessary, in every land, resulting in the establishment of the Communist idea in some form to do away with war. Women should stop short at nothing but the full abolition of war, pull the support from under it and go about the building of a new world as Russia is painfully trying to do."

Mrs. Gifford Pinchot was mentioned for a chairman of an important committee in the council. Mrs. Pinchot was not elected for the place, but she is one of the inner circle in the National League of Women Voters and her dominance in that organization has a vicarious reflection in practically everything done in the National Council of Women, because most of its chairmen are members of the League of Women Voters.

Recently the Boston *Transcript* published a series of articles by R. M. Whitney on the "Reds in America." In one of these articles, Mr. Whitney published the "Sucker List" meaning the list of names of those who contribute money to the Communist cause. Mrs. Gifford Pinchot's name appears upon this list and in view of the fact that Gifford Pinchot is governor of one of our greatest states and a Presidential aspirant, this connection with radical propaganda should be pondered. Mrs. Pinchot is prominent in the International Women's organizations and Mr. Pinchot's election as governor is very largely attributed to the work which the *"non-partisan"* League of Women Voters did in his campaign. Governor Pinchot is the father of paternalism or state socialism in the United States and if Count von Bernstorff, formerly German Ambassador to the United States, knows what he is talking about, these theories sponsored by Governor Pinchot were "made in Germany."

We have enumerated only a few of the women who are working to organize a bureaucracy that will control women and children, education and industry. The big idea is to centralize the control of all things possible in the Federal Government. And this *is* the destruction of Constitutional Government. This *is* Empire and it is of small consequence whether we call our ruler President or Kaiser.

The activities of the key women in the various organizations make possible an understanding of the methods by which these matters are to be accomplished. As these activities appeared at the Decatur convention, a glance at its program may be instructive.

Mrs. Maud Wood Park, president of the National League of Women Voters and vice-president of the council, gave an address upon the subject of "Women's Aims in Legislation." Mrs. Park has been ably assisted by Mrs. Florence Kelley, the Socialist translator of German Socialist works, who is herself president of the Inter-Collegiate Socialist Leagues, later called "League for Industrial Democracy." Mrs. Kelley is mentioned in the Lusk report as being connected with more than one Socialistic organization. The League of Women Voters proposes to conduct a school of politics. It has already held sessions in several of our important colleges and universities. Naturally, it is necessary for them to mis-label their work to secure entry.

The membership of this League of Women Voters is the preponderant influence today in the National Council of Women. Almost equally powerful within the council is the Women's International League of Peace and Freedom, *whose delegates refused to salute the flag at the Decatur biennial.*

Among the resolutions introduced by the International League of Peace and Freedom at the convention in Decatur of the National Council of Women was one calling for the evacuation of the Ruhr, another for the cancellation of war debts and still another for the recognition of Soviet Russia.

To comprehend the full significance of the reappointment of Mrs. Lucia Ames Mead as Chairman of Permanent Peace in the National Council of Women, one should know the proceedings of the Annual Conference of the Women's International League for Peace and Freedom held in Washington, D. C., March 13-16, 1923. Mrs. Lucia Ames Mead is lecturer and organizer in this organization.

Over the headquarters of the International League of Peace and Freedom at Washington no American flag floats.

At this convention the spirit of the Russian Communism prevailed. The recognition of Soviet Russia was urged and it was agreed to deluge the members of Congress with letters to that end. Helen Hoy Greeley advised our government to follow the example of Mr. Otto Kahn, of Kuhn, Loeb & Company, international bankers, who advocate full and immediate recognition of Russia.

Each item of work advised by this convention is to be found outlined in the Third International Documentary Instructions sent from Moscow to the Communists of the United States and now in the files of the government at Washington. It was specifically stated in this document that the suggestions made are for the purpose of weakening the government.

One of their principal points is the abolition of the Army and Navy, especially of the Chemical Warfare Department, since gas may be used to quell riots, and they plan the beginning of the revolution in the United States with riots. Disarmament is to come about gradually through the discouragement of military training in the schools and summer camps, and the eventual abolition of the National Guard.

Mrs. Harriet Conner Brown, wife of Herbert D. Brown, chief of the Efficiency Bureau of the Federal Government, said, among other things, "We women are going to repeal the Army Reorganization act . . . . Act as mugwumps ladies, vote the Democratic, the Republican or the Socialist ticket to gain our ends, and do away with the Army and Navy, the National Guard and every other form of militarism . . . ." She also said that there are three ways to accomplish this. They are "the ballot, passive resistance, and education of public opinion through our propaganda. There is much for us pacifists to do. We must get into all sorts of clubs, women's clubs, farmers' granges, welfare associations. We must get into religious organizations whenever and wherever possible—Chautauquas, schools—everything, and we must send our propaganda everywhere." Mrs. Brown must be vastly pleased with the influence exercised by Mrs. Mead and other members of the International League of Peace and Freedom within the National Council of Women.

Real Spirit of Co-operation Found in Finland

Concluded from page 10

purchases the farmers' seeds, machinery and fertilizer, has a magnificent plant in the city of Helsingfors and subsidiary plants in a number of other towns.

I found that the Finnish co-operative society differs in quite a few respects from that of other countries. For example, the Finnish co-operator does not decline state help. In fact, he seeks it on the theory that his organization is one of the great constructive forces of the state. He asserts what I believe to be true, that this great force has been so badly injured during the political upheavals that its members need aid. He has no fear of receiving money from the state. That money, however, except in a few instances, is passed down to him through the co-operative central bank, **and no private bank gets a rake-off. He is not required to pay over five per cent interest.** Very few loans, however, are made except for items other than those which will assist in producing a crop. In 1923, the credit banks had loans out to the farmers of $3,013,333. All this lending is done through credit banks scattered over the nation. In 1922, the government loaned twenty-nine million marks, or approximately $773,333, and this year $1,173,333 to the farmers without interest. It may be asked why the government is loaning in such amounts without interest. This is undoubtedly due to the fact that because of the war, Finland lost her biggest customer in Russia. That country absorbed a great part of her exports. Since there is a temporary wall between Finland and Russia, the former has been at the expense of seeking new markets.

She has found one in England for her excellent cheese. That cheese I have had the pleasure of sampling at the creamery in Helsingfors. It is made like Swiss cheese. The Finn is so proud of it that he contends that it is better than Swiss cheese. He will explain to you in his quiet way that some years ago some workers from Swiss cheese factories came to Finland to carry on their trade. They discovered that the cream produced by the rich grass of Finland was superior to that of Switzerland and made a more excellent cheese. These workers soon began to make cheese on their own account and eventually became wealthy through their profits and retired. Now the co-operatives are profiting by the experiences of those successful Swiss and are making a similar cheese and shipping it to England. A small quantity even now reaches the United States.

The Finns are cautious about co-operative international action. This came to light when I asked why they did not join with Sweden, Denmark and Norway in their international co-operative buying organization. They replied that the Finns might not want to buy the same type of things, or purchase in the same manner. I did not infer that this closed the door to international action, but rather that they felt it was the part of wisdom to take the different co-operative steps one at a time.

The Finn believes that the highest type of individualism expresses itself in intelligent co-operation with one's fellow men in making for a greater and nobler Finland. The visitor feels that this spirit radiates everywhere. It expresses itself in their music and literature, is exemplified in their architecture, and centers in their national aspirations which are in no sense warlike, but tempered by the peace that comes to a nation of individuals near the soil.

Germany Forsakes Crutches for Walking Stick

New Rentenmark Does Away With Paper Deluge

By WALTER M. WOLFF

NOT a few of us still recall something concerning a certain "Deutschland Ueber Alles!" that was wafted upon the four winds in the summer of 1914 by the mailed fist of the German war lords. Four years later the proud cry had been altered slightly so that "Deutschland Unter Alles!" accurately described the despairing situation in 1918. Today, however, the half-forgotten, shrapnel-nicked old song may again be brought forth in all propriety to reflect most accurately the sudden transformation which has taken place in the Reich in four months. "Germany above everything!" above the world market on commodity prices, above the financial scrap heap of Europe, above reproach in general! Little green slips of paper which resemble cigaret coupons did it. They're responsible for everything.

On January 1, 1923, a New York newsboy (or anybody else, for that matter) could have sojourned in utmost comfort or have toured the country from end to end for a mere handful of pennies. On January 1, 1924, for six or eight dollars the hotel clerk of a second-rate Berlin hotel might have condescended to allow you to spend the night somewhere away up under the sheltering rafters where the gentle raindrops softly tap-tap you to sleep. The next morning the same clerk politely informs you he would rather not take dollars or other foreign currency, but would esteem it a great favor if you paid your bill with German Rentenmarks, the new national emergency money. All further argument is of no avail; he doesn't want your dollars except as a last resort and then only at a discount. It is really all quite interesting—indeed!

Things Different This Year

GOOD old 1923! Can it all be true? And one recalls with a pang of regret that the times really have changed. Yesterday every last German would have gone to extreme lengths for a lone dollar bill and today he wouldn't pick it up if he saw one on the street—well, almost! Yesterday a German's eyes would pop out big as balloons if you spoke in terms of trillion marks to him. "Give me a dollar and take the stuff!" he would say, voraciously. Now the funny part of it is that these selfsame trillion marks of yesterday are no longer called "Trillion" but are known under the much more blasé title of "One Rentenmark." At any rate, it makes considerable difference to a German whether you say 15,000,000,000,000 marks to him or merely 15 (Renten) marks. Now that he has something with a backbone to it he feels himself once more living "in the good old times" when marks were worth their weight in gold and silver. These new marks are the equivalent of a first mortgage on Germany's real estate wealth and it appears that they enjoy the utmost confidence of the people, and belief that they will remain absolutely stable is growing daily.

Now that Germany has at last made up her mind to get out of her rut of impotence and has resolved to make an end to the paper mark debacle, sixty million souls are suddenly finding themselves able to do the things they were wont to do many years ago when life was not the near-slavery for them that it is today. But German industry is not so well satisfied with the latest trend of events. The government says, "No more inflation or bust!" German industry cannot forget the glorious harvest of yesterday. And for the latter the days departed were red-letter days indeed—every one of them.

Although the Reichsbank discount rate had been repeatedly raised in the past, currency depreciation always rendered an accurate check on the doings of German industry wholly ineffective. Strange results came to the surface. For example, a firm which on January 1, 1922, borrowed $50,000 worth of marks, was able to pay them back on December 31 *with $1,000!* But in 1923 the disproportion was fantastic. *Credit amounting to five hundred million dollars on January 1 could be paid back on December 1 with ONE DOLLAR'S worth of paper marks!* A ridiculous situation of this kind will, of course, never take place again as credits are now granted on a gold mark or "wertbestaendig" basis and German industry must learn to adjust itself once more to the odious humdrum of normal times. But the coffers are so full that it will take a mighty "chill" of hard times to stir up German industry's anxiety to any great extent. For example, the German, Swiss, and other winter resorts report a record attendance year and a notable absence of the usual foreign patronage. But the new German rich of 1923 vintage more than make up for the deficiency. Paper mark speculation seems to have been mighty profitable business; no wonder it lasted so long!

And now the German arch-profiteer, his money-bags fairly bursting, must find some outlet in the line of pleasure and he chooses the most luxurious spots of Europe, to the astonishment and bewilderment of the foreign hosts whose ears had been copiously filled with heart-rending news of the starving and suffering of the German nation. Even the workingman has become a professional speculator—he can name most of the important stock quotations to you by heart—and the school children could give their grandparents stock market hints that would do justice to many a seasoned Wall Street broker. Briefly, the German people have begun to deviate from the path that once led to utmost thrift and honest labor. They find it much easier and exceedingly more profitable to hitch their wagons to yonder stars than to plow horses down here among us mortals. And so it is not to be wondered at that their neighbors feel sure there is "something rotten in the state of Denmark," which in this case more appropriately applies to the queer antics of the German mark. Something indeed "rotten" must have happened in the Fatherland: otherwise how can we account for this sudden transition from beggar-man to spendthrift?

But we must focus our observations a bit more sharply and clearly. It is not all gold mark that glitters in the German Reich today. There is still to be found on every hand intense want and suffering on the part of the middle classes and among the poorest of the great army of unemployed—the common people. One has to move about a bit, however, and scratch the surface considerably before he gets down to the real grief and misery among the masses of the people. The en route tourist with his more or less critical glance round about him invariably fails to see very far into the actual state of affairs; nor is he to be blamed, for there is little to see on the thin surface or veneer on the outside. For example, how, asks the casual American observer in a city like Leipzig, if the Germans are starving, freezing, and in need of employment as they claim to be, can they fill to the very doors the opera houses, concert halls, motion picture theaters and other houses of public entertainment every night of the week?

Stay Home and Save Money

IN LEIPZIG the American observes that he must pay *one dollar* for the best seat in what would have extreme difficulty passing for a second-class motion picture house in America, where a played-out American film is the special attraction and the only musical offering is an attempt of a five-piece German orchestra to express American jazz—an attempt with all the elements of tragedy.

The wise American will not cross the Atlantic for a sojourn with the Teutons this year. The sinister doings of the German Rentenmark are probably sufficient to keep him quite contented and happy that he lives in a land where his dollars are always the equivalent of one hundred cents each. The "See America First" idea will appeal to many a restless, annual commuter to Europe's storm-swept shores and Europe will doubtlessly yearn for the return of the charitable Yank. But from Central Europe the forecast reads: "America for Americans and Germany for Germans *this* year!"

Berlin, Feb. 23, 1924.

These Berlin stock-market gentlemen yearn for inflation and big profits—

—but these simple German folk decidedly do not.

Colored Glass Now Cures All Our Ills

Concluded from page 4

'DIS-EASE.' Use the Area Chart and Spectro-Chrome Symptomatology, and treat with common sense, according to the Therapeutic System, as mathematically set down. Keep off from 'diagnosis,' as understood by the old schools of healing, and follow the Spectro-Chrome methods exclusively.

"6. Use *no* Drugs or Chemicals, *no* manipulation, and *no* Surgical or other instrumental aid outside of the regular Spectro-Chrome Equipments and Accessories. A case where anything outside may be necessary may need 'constructive surgical' assistance, as I call it, and the Spectro-Chrome Institute does not authorize *you* to use such measures. *Keep Off!!!*"

The above paragraph of instructions and warning is printed verbatim, capitalization and italics, as written by Dinshah. It is of value because it exposes the manner in which practitioners of spectro-chrome therapy evade the law. To continue with the instructions and warning:

"7. Use such standard signs as the following; they are supplied by the Spectro-Chrome Institute:

SPECTRO-CHROME THERAPY
Restoration of the Human
Radio-Active and Radio-Emanative Equilibrium
(Treatment of Dis-Eases)
by
ATTUNED COLOR WAVES
No Drugs—No Manipulation—No Surgery

JACK JOB JONES
Spectro-Chrome Therapist.

"8. Issue no certificates of birth, death or sickness. You will rarely have occasion for them anyhow.

"9. Do not say that you are using 'Colored Lights' for treatment. People have been sitting in the radiance of all kinds of colored glass windows for ages and were affected neither for good or bad perceptibly. What you are using is 'Attuned Color Waves,' which, in plain language, means Color Waves mathematically graduated to certain degrees giving certain wave lengths for certain predetermined results when applied technically to certain areas of the human body, in accordance with Dinshah's System of Primary, Secondary and Tertiary Polarities. Attuned Color Waves in reality are waves of different 'axial polarities,' and their operation on the human system is different from ordinary light, which is a beam of 'full polar oscillations.'

"10. Do not tell your patient you will 'cure.' Man 'treats,' Nature 'cures.' You are merely the agent of Nature in this respect, and what was induced or produced in your patient by transgressions of Nature's Laws, you attempt to remove.

"11. Following honestly the above outlined rules, no legal law will be able to touch you, and should it be made to touch, it will only burn its own hands, and subject the persecuting prosecutor to ridicule of a never-to-be-forgotten character. * * * For the present, grow on your back a rhinoceros hide, topped with tortoise shell."

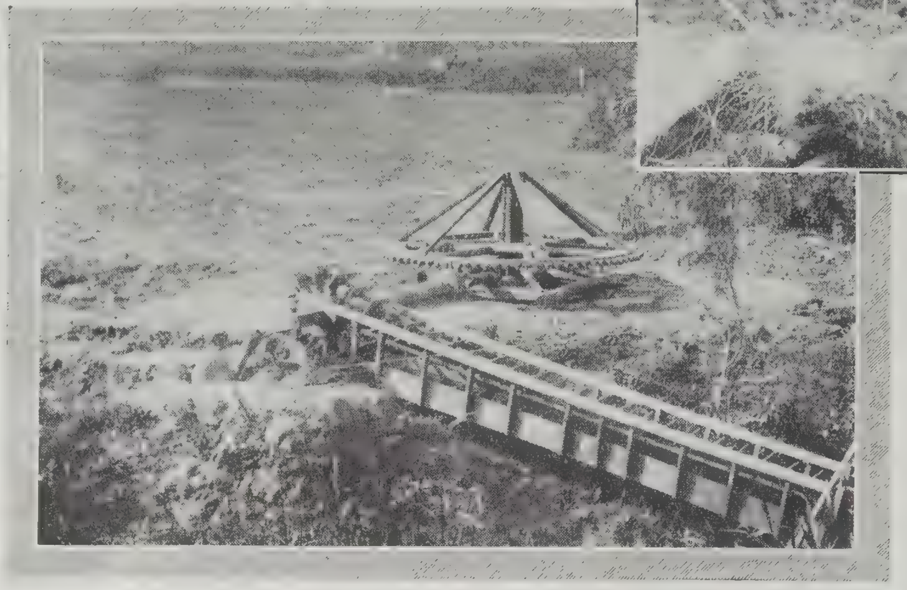
Thus prepared and equipped, bearing all the warnings in mind, the practitioner of spectro-chrome therapy must never forget to place the patient so that he faces the south. If the patient is in bed, place his head to the north and his feet to the south, so that he is on the "Magnetic Meridian," a position considered absolutely necessary since only by this means may the disturbing effects of terrestrial magnetism on the nervo-vital forces and the radio-active and radio-emanative organism of the body be neutralized. E. R. A. faces the patient west on his own private magnetic meridian, but it would be far from the writer's intent to confuse in the mind of either the practitioner, the patient or the reader the methods employed by the discoverer of Electronic Reactions with those of the inventor of Attuned Color Waves.

China's Patriarchs of the Soil Use Wisdom of Centuries

Modern Methods of Farming Are Unknown to Natives

By CARROLL K. MICHENER

The most primitive of the Chinese threshing machines. Beating out rice by hand.



Primitive irrigation machinery in Central China.

WE HAD seen all that we cared to see, for the moment, of Shanghai's Parisian pose—its sparkle of European gayety and its glittering amalgam of Western wickedness and Eastern vice. We had looked upon the opium dens and the tea houses and the Buddhas, and found them all far less evil, malicious, colorful or dramatic than motion pictures had seduced us into expecting. The smelly, narrow, sinuous streets of the native city had pressed us to the very elbows of China's multitudinous industrial life. And yet, although these things confirmed for us most of America's meager, conventional notions of the Orient, we found them in some chief essential lacking. The picture was incomplete.

At the outer end of a slimy-stoned, malodorous avenue we discovered the clue to that missing element. Urging our sweating, reluctant rickshaw coolies farther and farther from the swarming center of the metropolis, we came presently to the busy serenity of open fields. Earth perspired under a mellow sun, a thin breeze brought sounds of ululation from throats of laboring coolies, and in our nostrils was the pungent perfume of fertilization and fecundity.

A bronze-torsoed truck gardener passed us, straining to the task of trundling his top-heavy, wide-handled wheelbarrow, piled high with cabbages. Boys, standing knee-deep in an irrigation ditch, playfully but industriously scooped water in bamboo buckets from one level to another. A pair of barefoot farm hands, in another field, were treading the rungs of a wooden power wheel that lifted water, by a crude endless chain of wooden cups, into a receptive rice field. Coolies with baskets balanced upon their shoulder poles were slowly and laboriously transposing the mud bottom of a drained canal to the surface of a distant field. Women, whose bound feet would have made their work difficult otherwise, sat upon three-legged stools wielding long-handled hoes.

Here Is Uncomplaining Toil

THE flat landscape, melting into a wide, misty horizon, was of a single color. It was green with unintermittent growth. The gray walls and roofs of village clusters, of occasional temples, and the pale azure of humid skies reflected in still canals, scarcely punctuated this all-pervading density of greenness. The blue of trousers and tunics—and blue is the color of labor's garb throughout Cathay—served but to accent the overwhelming hue of the verdant fields.

There was no idle corner of earth, save, of course, for mounds of the dead scattered at liberty as far as the eye could see, and even these pastured, as a rule, some irreverent, tethered goat. Two blades grew where one might be expected. Gardens, neat as a diagram, were innocent of weed, chary of margins and walks. There was an amazing economy of space. In rows but a few inches apart thrived, alternately, sweet corn, cabbages, lettuce and beans in varying stages of growth. Vines were trained aloft upon airy trellises of bamboo rather than horizontally upon extravagant areas of earth.

Much of the beauty of this smiling expanse, it is true, was marred for us, at first, by sensitive and fastidious Western nostrils. The odor of fertilizer was persistent and overpowering. Compost pits reeking with fermenting mixtures of every known or mysterious item of waste that can be made to yield sustenance to a growing plant breathed up miasma from the roadside.

And yet there was no power in these olfactory affronts to divert us from the great fact lying revealed in this fertile landscape. This was the essential China It was the home of the essential Chinaman, for four out of five of the four hundred million, we remembered, were farmers. In this peaceful, fecund, enduring countryside, not in the changing, moiling, futile cities of artisans and beggars, manufacturers and merchant princes, was to be found most of what was characteristically Chinese.

It was, to us of the West, least known and least understood; and yet it was most real, possibly the most distinctive. What had banditry and massacres of foreigners, political intrigues and student strikes, smugglings and mysterious crimes, implanted vices, innovations and institutions from the upstart, ephemeral West to do with this permanent foundation and bulwark of the oldest continuous nation upon earth? Here was patient, kindly, uncomplaining toil, the like of which was not to be found elsewhere in the world.

The wheat farmer of China, we were sure, would be making no demand upon the government to help him out of a pickle he ought to have learned centuries ago how to avoid. Shen Nung, the legendary emperor who is credited with being China's foster father of agriculture, revealed to him nearly five thousand years ago a number of simple facts about farming which, we believed, would do much toward banishing the rural problem in the United States.

Centuries' Wisdom Teaches

MORE than forty centuries of homely, accumulated wisdom had taught the Chinese farmer what to grow, and how, in order to wrest from the soil its maximum return. Diversified farming, in China, was as ancient as the race. There would be no danger here, we felt, of an over-production of kiaoliang, or rice—or wheat. The Chinese farmer's output was too nicely and instinctively adjusted to his markets to permit such stupidity. It was clear to us that he would need no coaching by a county agent or a politician upon the elemental truth that when wheat becomes unprofitable it is wise to change to another crop or convert it into butter and meat.

We picked up handfuls of the moist black loam that had been doing service since Shen Nung, some twenty-eight centuries before the birth of Christ, is reputed to have converted the pastoral tribes of his kingdom into an agricultural people. We examined this valiant soil almost with reverence. It was to become apparent to us, after long excursions into rural China, that the farmer of Cathay looked upon his land not as a natural resource to be exploited, but as a machine. Into it he put, with infinite toil, certain ingredients; and these, with the help of Nature and the elements, he took out of it again in the form of produce.

Laborious Chinese methods of raising irrigation water from one level to another.

Not wholly so, we recalled, with something of a feeling of reproach, with the American farmer. His history was one of abandonment and waste. He had rioted through his resources, moving ever westward from depleted acres to new lands waiting to be ravished. He was more of a real estate speculator than a farmer, after all. But at last he had come to the end of his tether. There were no more new lands. The Pacific Ocean had long since drawn a boundary to his wanderings and speculations. He had, now, to become a real farmer, like his brother in the Orient, or push off into the sea. He must return to those once fertile acres in New England, Pennsylvania, New York, New Jersey—even to the central states—and repeople the abandoned farms, worked out and impotent under his despoiling hand in little more than two hundred years. Like the Chinaman, he would be obliged to make a machine of his acres, and get from them produce commensurate with what he put into them in the form of intelligence and labor.

Through an interpreter we discussed these things, upon occasion, with a veritable patriarch of China's soil. He had reached a great age upon the land that had given him birth; never, in fact, had he been twenty miles away from it. But his wisdom reached back into the distances of time. He reminded us of familiar conceptions of Confucius, flowing of beard, benign of countenance, reserved of bearing. His sparse acres fed a comparative multitude of mouths; had done so for unnumbered generations.

Wen Cultivates Intensively

WEN—this was his name—raised wheat, small, garden-like patches of it among his multifarious other crops. We asked concerning his yields and learned that year after year, as long as he remembered, they had not been less than forty bushels an acre. If there had been less—and he nodded at this, with a stern smile—his dependents would have gone hungry.

We recalled the boasts of farmers and real estate men in rich new regions of the United States, and knew their figures were greater than these. But we discovered, by reference to statistics, that the average wheat yield of the United States was less than fifteen bushels an acre, whereas China's was nearly thirty. No country, unless it is the United Kingdom, has a record that is better.

We had thought of China as a country of chopsticks and rice. But geographies did not properly emphasize the size of this vast country. There was a rice area, and a bean area, and a wheat area. And the latter was astonishing in its extent. We rarely saw rice throughout the great northern provinces. In its place was hard bread and macaroni manufactured from wheat flour. Chinese Government statisticians laid claim to an annual production of wheat in all China of more than three hundred million bushels, or approximately a third the output of the United States.

But though the farmer of Asia had, it was clear, much to teach the Western grower in point of industry, patience and simple sagacity, we found nothing to be said of his example in financial achievement. None of his virtues seemed capable of arguing prosperity. He was proverbially poor. Nowhere in China were we aware of private wealth upon the soil; nor had the tiller's reward for his faithful toil ever more than sufficed for simple wants.

The reasons, we concluded, lay grounded in no shortcoming of his own. His was the handicap of an overpopulated country. He had too many mouths to feed. Forty centuries and more of intensive farming had enervated his soil. He lacked most of the golden advantages of the American farmer—education, roads, organized marketing facilities, modern machinery, and comparatively unvitiated natural resources. We speculated upon what he might do with these things, in a country less bound than his own to hampering traditions and superstitions!

But if the Chinese farmer never had amassed wealth, he had held an honorable station among his fellows. Of the four great classes which have composed the social structure of China since times immemorial, that of the farmer until recent years stood second. The scholar was first, the artisan third, and the merchant last. Of late the merchant has crept upward in the scale, and the venerable place of the scholar has been usurped by the politician and the business man and the soldier, the latter of whom had no place at all in the ancient arrangement. Still, from an academic point of view the Chinese farmer retains his station.

The classic literature of China, we discovered, was full of evidences of the esteem in which agriculture always has been held in the Far East, particularly in remote times. Until the end of the Manchu dynasty, in 1911, every Chinese emperor annually had paid a semi-religious tribute to the tilling of the soil. He came from his palace with a gorgeous retinue of ministers, and ceremoniously guided a plow across a field that had been prepared for the royal event. By this act he assumed the leadership of his nation in the honored calling of agriculture, just as he stood on the sacred hill by the Temple of Heaven, in Peking, once each year and became high priest for his people in paying reverence to deity. Agriculture, indeed, had its temple in the Tartar capital, a great collection of tiled and dragoned structures, which, when we saw them, were devoted to an exhibit of the Peking schools.

The Lore of the Soil

THE royal example found scholarly following. Chinese writers of all ages vied with each other in putting into literary form the lore of the soil, and the science of agriculture so far as it has been known to the Chinese as such is represented in countless works which once crowded the imperial libraries.

Upon the shelves of the Royal Asiatic Society in Shanghai we found the memoirs of Li Hung Chang. He, like most of China's strong men, literati and prophets, had, it appeared, written an apostrophe to agriculture, or rather to the "Divine Husbandman," Shen Nung. This, he had modestly hoped, would take its place in literature with the works of Mencius.

Even when I was a little boy,
When my father labored,
When my mother scolded,
When there were mean times in the village,
And I was almost tired of living;
I thought of thee, Shen Nung—
And the green grain thou gavest,
The yellow corn so rich in bread,
The nodding wheat that gives color to the blood,
The vegetables that give strength to the bone.

You taught us all these things,
You made them ours,
You made them beautiful, and gave them to us.
You bade our land be fertile, the soil in which they grow.
Because you smiled, the winds blew fair,
The sweet rains came like drops of glory,
The sunshine did not hurt,
The moon told the crops to keep growing,
The stars blessed each head of grain,
The dews dropped their blessings
On the corn and the vegetables,
And made them glad,
For the people's sake.
You taught the golden sun to shine,
The night to be cool and refreshing,
The air to be sweet and to soothe,
The trees to hold back the storm,
The grain to bow its heads to meet the blast.

Thus, Li Hung Chang; and, similarly, the long line of literati reaching down China's corridors of time toward the venerable Confucius. The Sage, curiously, knew nothing of Shen Nung; that worthy's legend developed later. But Confucius wrote of the renowned Yao and Shun, emperors in the dawn of China's history, and to them, particularly to the latter, he attributed China's agricultural wisdom.

We were pleased to observe in the writings of Li and his like some resemblance to the political verbiage that may be found in the *Congressional Record*. Li and the American Congressmen are at one in their praise of agriculture. But there is a salient difference. Not infrequently, from the forest of fine political phrasings heard in the United States, some practical aid to the farmer has emerged. This, by and large, seems never to have happened in China. Statesmen have been content to let their encouragement of agriculture rest with metrical lines elegantly brushed in vermillion ink according to the best Confucian canons.

The Chinese farmer has had to shift for himself. And save for occasional famines and crop failures, matters beyond his control, he has done very well. Daily he nourishes the four hundred million, a tremendous and still growing population that has been made possible largely by his industry and ingenuity.

It came to our ears from the late Bishop Bashford, one of the most observant of America's missionaries to the Orient, that among the chief causes of China's great population was its discovery in ancient times of the superior value of a grain diet over a meat diet. He had learned, he said, that one thousand bushels of grain had at least five times as much food value and would support at least five times as many people as would the meat or milk that could be made from that amount of grain.

Farmer Wen confirmed for us this theory. He kept no cows; milk, butter and beef were alien to his larder, as they are, indeed, to the diet of practically all China.

Plowing with water buffalo in preparation for a rice crop. This land has grown a winter crop of barley. In the background a field of winter wheat is ready for harvesting.

He could, he said, get far greater food value from an acre of land by growing rape upon it and extracting oil from the seed than by pasturing a cow and making butter from her milk. His family found nourishment in the growing plant, and pickled it, like sauerkraut, for future consumption. Moreover, since it was a winter crop, it made way for two or more summer crops to be taken from the same field.

And here, evidently, was one of the reasons for China's immense productivity. Not one crop, but two, three, and often four, matured annually from a single acre. Wen showed us, for example, his rice field. It had already harvested a crop of vegetables, and was being prepared for the transplanting of rice sprouts that had been nourished for thirty to fifty days into bright green luxuriance in a minute nursery bed. There would be no rest for the soil even when rice had been harvested, for it must then undertake a winter crop of rape.

Multiple-cropping appeared to be facilitated by the practice of planting in rows. We had supposed that the wheat drill was an American invention, but Farmer Wen laid claim to it for China. It had been in use, he said, for hundreds of years. His own small field was in clean rows, almost in hills, like American corn. Between them, four or five weeks before harvest, he would plant a second crop.

Nor was Farmer Wen ignorant of the virtues of crop rotation, which not all American farmers appear to have realized even after a generation or more of agricultural propaganda. He raised wheat, barley, clover, rape and beans in successive seasons, following each with a crop of rice from the same ground. He knew the secret of the nitrogenous nodules of clover and other leguminous plants, though he had for them no scientific formula or terminology. Beside his wheat field grew a small strip of clover, and this, he explained, would either be turned under to provide nourishment for rice or made into fertilizer, by an ancient process of fermentation, together with other refuse heaped into compost pits. This knowledge had come to him, not through recent government bulletins or from peripatetic county agents, but from perspicacious ancestors whose lineage ran backward even, perhaps, close to the mythical Shen Nung.

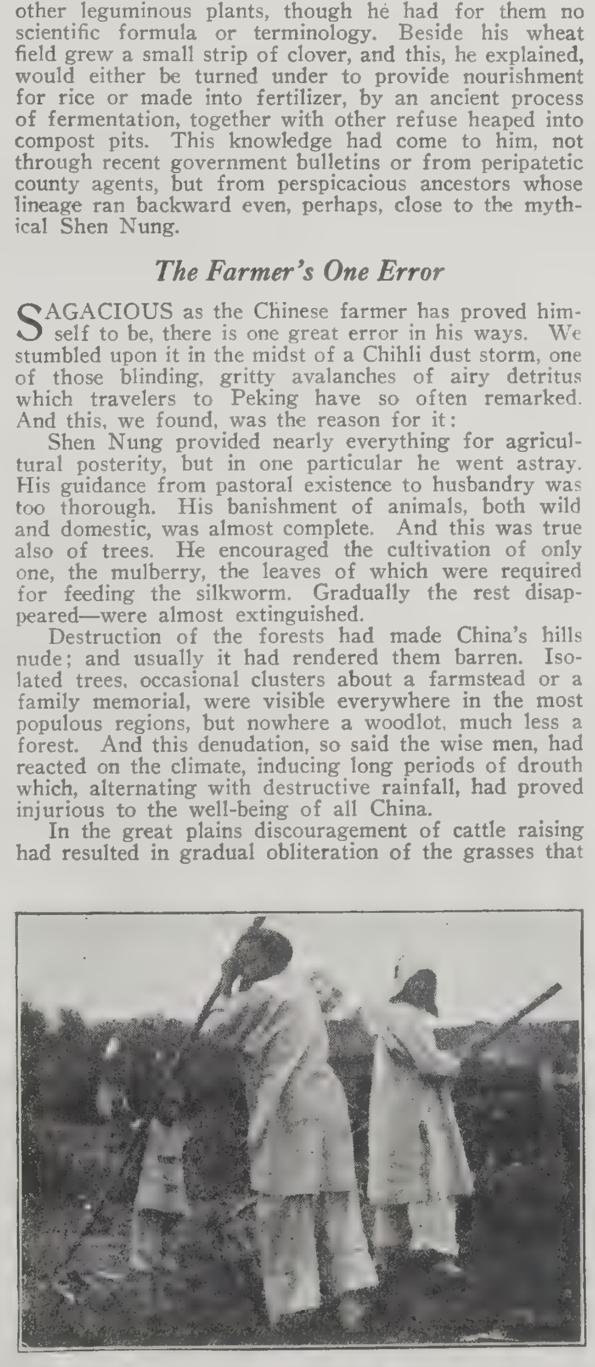
The Farmer's One Error

SAGACIOUS as the Chinese farmer has proved himself to be, there is one great error in his ways. We stumbled upon it in the midst of a Chihli dust storm, one of those blinding, gritty avalanches of airy detritus which travelers to Peking have so often remarked. And this, we found, was the reason for it:

Shen Nung provided nearly everything for agricultural posterity, but in one particular he went astray. His guidance from pastoral existence to husbandry was too thorough. His banishment of animals, both wild and domestic, was almost complete. And this was true also of trees. He encouraged the cultivation of only one, the mulberry, the leaves of which were required for feeding the silkworm. Gradually the rest disappeared—were almost extinguished.

Destruction of the forests had made China's hills nude; and usually it had rendered them barren. Isolated trees, occasional clusters about a farmstead or a family memorial, were visible everywhere in the most populous regions, but nowhere a woodlot, much less a forest. And this denudation, so said the wise men, had reacted on the climate, inducing long periods of drouth which, alternating with destructive rainfall, had proved injurious to the well-being of all China.

In the great plains discouragement of cattle raising had resulted in gradual obliteration of the grasses that once clothed them. For fuel, the Chinese for centuries had been reduced largely to the use of droppings from animals, the meager growth of wayside grasses, the roots of plants, and shrubs torn from the crumbling soil of the denuded hills. And the result was dust.



Chinese women at work in a field, using the common spading fork that does a large percentage of the work of preparing for new crops.

China's soil in the northern provinces is a light loess. Unprotected from erosion, the rains wash it away, and the streams carry it to sea, or build up their beds with it until inevitably their banks burst and flood the lowlands. Winds blow it away, for the blustery season of the year comes at the time of spring plowing, and the air becomes darkened for days at a time.

One given to statistics went to the trouble of computing for us that a spring dust storm in Chihli bears out to sea several million tons of fine soil; and, as there are several gales each year, the extent of this loss, which seems to have been going on since not long after the time of Shen Nung, impressed us as overwhelming.

The Germans began reforestation in their Shantung concession many years ago, and the idea caught on in young China. But the new republic moves slowly, and government measures in this, as in all things, are laggard. Agricultural education enters into the ambitious scheme of things at Peking, but that, too, halts before its almost implausible task. The National Educational Commission has its plans, but it will be a generation, perhaps, before they can be put into effect. In the meantime some of the provinces are said to be taking initial steps toward providing every village boy with the rudiments of technical agricultural training. Several agricultural high schools have been established in the more progressive provinces, and there are four agricultural colleges of university grade to train men for scientific research and for teaching in middle schools. One of these is located at Peking, two at Nanking and one at Canton. These institutions have either been established by the governments of the provinces in which they are located, or by philanthropic societies with government support.

Must Go On With Fight

BUT for China's farmer of the present generation, so Wen sagely agreed with us, there is no help beyond the inherited sagacity that has filtered down through the ages from the time of Shen Nung. He must go on with his struggle to feed an always growing populace upon soil long wearied of its task. He can make both ends meet, if only the arrangements of Nature are not adverse. Unfortunately his skill, his patience and his supplications to the gods are not always capable of insuring this end. Floods, drouths, hurricanes, bandits, taxes, rebel armies—a multitude of calamities—are constantly interfering with his chances for prosperity.

His acres diminish not only in fertility but in number. There is a tendency for farms to become smaller with each passing generation; for it is the custom to divide among all the heirs an inherited holding of land The estate of Farmer Wen, so he calculated, was less than five acres; and under his gray-tiled roof were twenty-four dependents. Housed by his small stable of sun-dried mud there was, in addition, a mixed trio of domestic animals—a broad-horned water buffalo whose task was to turn the mill sweep and to pull a wooden plow, a razor-backed hog by no means overfed, and a hardy goat. These, and a flock of ducks, Wen explained, consumed all odds and ends of food and fodder that could be spared. Their provender, in fact, was almost wholly refuse, or such produce as could not be made suitable for human alimentation.

It was a struggle that never ceased, Wen confessed, to keep a mortgage from his lands. Sung, his neighbor, confronted with the necessity of borrowing to provide dowry for a disastrous surplusage of daughter, had just lost his acres to a rich Shanghai merchant.

This gave us the clue to a comparatively modern development in Chinese finance, the trend toward tenancy, which was exerting its opposition to subdivision of lands. We caught upon statistics somewhere that showed no less than a quarter of China's farmers to be renters. The man of capital had found land, in the country's present condition of disturbance, his most stable security. It was natural, therefore, that comparatively large estates should accumulate and consolidate in the hands of absentee landlords.

But, as has been said, the Chinese farmer has little complaint. He tends his small plot of soil, sometimes no larger than an American building lot, with calm aloofness from the turmoil and unrest of the world about him. His is a certain unspoken contempt, mingled with Confucian tolerance, for the foolish pother of change and iconoclasm beating in upon him, futilely, from lands across the seas. He is too intent upon his honest work to give heed to innovation; his ways were his fathers', who had them from Shen Nung. His wants are few and his philosophy simple.

Hotelward, to the center of Shanghai, we came upon a temple of idols blackened with age and with incense, and were reminded that China's tillers of the soil still clung, in the main, to old traditions. Rainfall being a matter of prime importance to them, either from too much of it or too little, they had evolved through the centuries a curious fabric of superstition that was bound up with the sober elements of their craft. They still had their divinities that governed the action of winds and waters: the Goddess of Mercy, originally male but now by process of popular metamorphosis female; the Dragon God, known also as Lung Wang; and Tai Wang, who was generally incarnated in a snake.

Upon a later day we encountered one of these deities as represented in his battered, corroded, wooden image sitting hot and uncovered, under a scorching sun. He had been carried from his sheltering niche to this spot of indignity beside a village street because weeks of supplication and burned candles and smoulderng joss sticks had not brought down rain. Nothing but this violence on the part of the rural community had seemed capable of rousing him from sloth.

Thus, not even from the gods, we observed from this phenomenon, would China's patriarchs of the soil permit trifling with ancient prerogatives and established ways.

The oldest dwelling in Germany, possibly the oldest in Europe, is located in the little hamlet of Winkel, in the valley of the Rhine, and is 1,200 years old.

Non-resident aliens coming to America to lecture and write articles would be required to file a sworn statement of the purposes and intentions under the terms of a bill to be introduced soon. Its sponsor, Representative Tinkham, of Massachusetts, says, "Vast sums of money have been spent to affect color, shape or even suffocate the normal and spontaneous expression of public opinion in this country on profound political issues, economic policies, institutional principles and social problems."

An aerial survey of the land located near the present tower of I-Chow, 60 miles southwest of Pekin, indicates that the site at one time contained a city of considerable importance antedating written history.

One child in every twelve between the ages of ten and fifteen in the United States has to work, according to an investigator.

The rite of fire-walking in Tahiti as practiced by the priests is explained as follows: The stones used are basalt, of volcanic origin, porous and nonconductive. A stone heated red-hot at one end remains comparatively cool at the other. Because of this fact the native priests and their acolytes may with impunity walk over the surface of the glowing rocks.

An "animals' cenotaph" will shortly be built near Hyde Park corner, London, in memory of the birds, beasts, and fishes that died in the service of the British Empire during the war.

The most northern part of the United States proper is 100 square miles in Beltrami County, Minnesota, on the northwestern shore of the Lake of the Woods. This tract is completely separated from the state of Minnesota by the lake and cannot be reached by land without traveling over Canadian territory. It came into the possession of the United States through a geographical error in the Treaty of Paris signed in 1783, the original surveyors believing that this territory was south of the 49th parallel instead of north of it.

The Hittites were an agricultural people and famous raisers of bees. A law of 1370, B.C., provided that any one guilty of stealing bees should be punished by being stung to death.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Naval Reserve No. 1, which the government leased to E. L. Doheny's Pan-American Oil Company, lies in the Elk Hills region of Kern County, California, about twenty-five miles west of Bakersfield, oil center of the San Joaquin Valley in California. The land is semi-arid with temperatures frequently up to 120 degrees. Beneath this forbidding desert lie great pools of oil.

Four large furnaces located at Pootung, across the Whanpoo River from Shanghai, China, are used solely for the purpose of destroying drugs which have been seized by customs officials. Many thousands of dollars' worth of opium and its derivatives are burned annually.

The old saying that "man works from sun to sun but a woman's work is never done" is belied by the figures of the National Bureau of Economic Research which shows that the hired girl on the farm working by the week puts in from one to five hours less per week than does the hired man working by the month. Also the female employed by the day works about one-sixth less time than the male day worker.

A woman spoke in an English cathedral for the first time in 1,300 years when Lady Barrett recently addressed a gathering in Canterbury.

Writing to the editor of the Jewish *Voice*, Clifford P. Smith, of the Committee on Publication of the First Church of Christ, Scientist, Boston, says: "Christian Scientists would be willing to have the reading limited to the Jewish Scriptures (or to what Christians call the Old Testament) rather than have the Bible excluded from the schools."

The Pullman company is issuing a bulletin on the dangerous and increasing habit of women smoking in berths. It is said that if the custom is not curbed, smoking compartments for women will have to be considered.

The Post Office Department is preparing to make almost 1,500,000,000 postal cards during 1925.

During the severe midwinter, mountain sheep in Southwestern Colorado were forced to come down to the settlements of man for fodder. At Ouray, Colorado, hay is provided for them on their daily visits during the severest weather. The citizens are proud of the herd and defend them both from the weather and from human enemies.

An issue of silver coins to be called "shillings," equal to 10,000 present Austrian crowns, are to be minted in Vienna.

James Eads Howe, known all over America as the millionaire hobo and benefactor of the downtrodden, has forsaken the hobo life and plans to settle down and enjoy life in San Diego, California, in the land of sunshine and orange groves, according to reports.

The scandal of Teapot Dome is having a repercussion in Italy where it is said the negotiations between the Italian Government and Harry Sinclair were temporarily stopped. The Italian press hints that inasmuch as the Dutch Shell and Standard Oil companies have not competed where they have hitherto operated, there is something wrong.

The "stinging tree," a luxurious shrub, is a curious plant of Queensland, Australia. It has a peculiar odor and when touched it leaves no mark but the pain is maddening and for months afterward the affected part is tender when touched in wet weather or when it becomes wet in washing.

Bela Gross, "a young Russian," had been refused admittance to France, Germany and the United States. But a New York Jewish organization took up the case and the young "Russian" was speedily admitted to the United States.

A jazz band played "Yes, We Have No Bananas" and "Ain't We Got Fun," at the funeral of Jules Tantot, theater owner of Amiens, France. M. Tantot's will obliged his heirs to fulfill its conditions of a jazz funeral, with a full brass band, although the good people of Amiens and the surrounding country were shocked.

Arnold Townbee entered upon his duties as professor of Byzantine and Modern Greek at King's College, London, without knowing that the Greek donors who endowed his chair had stipulated certain terms of control. When his studies led him to discover and report the truth regarding Greek atrocities upon Turkish civilians during the famous retreat in the Asia Minor campaign, his resignation was in order. The London *Nation* made the following comment: "It is an invariable and almost sacred rule in all self-respecting Universities that, when once money is given to the University for scientific purposes, it belongs absolutely to the University and the donor retains no control or power of interference."

CHRONICLER OF THE NEGLECTED TRUTH

The Theater's Three Doodle Doctors and One Saint

Never Was a Prize Fight "Smoked Up" More Successfully Than Was "The Miracle"

By PETER SCHUYLER

THREE persons who are entitled to the letters D.D. after their names are just now occupying the fascinated eye of Manhattan the Wise. They are not clergymen. Their degree has nothing to do with theology. In their case D.D. means Doctor of Doodle. In order of importance, outside their own judgment, naturally, they are: George Bernard Shaw, George Michael Cohan, and Morris Gest.

The two Georges, who must not be confused with the Jewish gentlemen operating a hand-me-down clothing business under that trade name, are well known in their particular specialties. George Bernard is the recognized authority on Flap Doodle. George Michael, who was born on the Fourth of July, inevitably drifted into the practice of Yankee Doodle. So successful has he become that of all the Yankee-doodlers in the land—a not inconsiderable number, as may be noted around election time each year—he is admitted to be the Yankee Doodle Dandy. Dr. Gest is distinguished as the man who has lifted Press-agent Doodle from being considered the charlatanry of the street corner faker into the position of an exact and lucrative science.

The Definition of Doodle

IT SHOULD be stated for purposes of clarity that Doodle is a mind food prepared for the use of those who have never been accustomed to exercise the brains with which they were born. Its essential components are always the same. They are Bosh and Bunkum. Various Doctors of Doodle, however, have, as a result of their experiments, added other things to these two ingredients from which they get the best reactions. For instance, Dr. Shaw pours in large quantities of cynicism, smartaleckism, and dogmatic undogmatism. Dr. Cohan, at the beginning of his professional career, was said to rub into the essential leaven Pure Patriotism until the mass showed One Hundred Per Cent Americanism. This product was originally marketed in the form of popular songs or plays about which were wrapped miniature Star Spangled Banners or lifelike photos of Uncle Sam shaking a defiant fist at the established universe. Whether it was the package that sold the goods or the goods that sold the package no one knows. But Dr. Cohan did a tremendous business for many years and acquired a nationwide clientele which steadfastly refused all makes of Doodle not bearing his name. Some years after the Spanish-American War the amount of Pure Patriotism in the Cohan formula was reduced to a minimum and the Spirit of Dear Old Broadway was substituted. The change had no effect on the sale of the doctor's brand of Yankee Doodle and no ulterior effect on the mental condition of those accustomed to the original recipe. When the United States entered the World War the Spirit of Old Broadway was eliminated from Dr. Cohan's compound and faithful old Pure Patriotism was restored to the Doodle formula. The switch brought instantaneous results and Dr. Cohan is said to have sold the rights to one form of his prescription put out under the song title "Over There," for upward of $25,000. Since the Armistice he has retired from general practice as a Yankee Doodler, but so great is his reputation and so firmly established his prestige that he still numbers his patients by the thousands. No matter what he puts on the market, his customers buy just the same. They know that there is some Doodle in it and having once contracted the habit they don't care what kind it is.

Gest—Heir to Barnum

DR. GEST has been practicing his specialty only a short time in comparison to the years spent by the Two Georges in the service of humanity, but he is already looked upon as the legitimate heir to the mantle of the late Phineas T. Barnum, the greatest Doctor of Doodle this country has produced—to date. Dr. Gest came on the scene when Press-agent Doodle had fallen into complete disrepute. It had no exponent worthy of the name since Dr. Barnum discovered the nutritive value of Bunk and proved it in the case of The Woolly Horse of the Rocky Mountains. It is true that the publicity department of the motion picture business had given a living to some amateur operators in the field, but they had failed to take advantage of the opportunity afforded them. They had no real standing in the world of Doodledom. Their stock in trade was stolen jewels, milk baths, and shooting scrapes for the film queens. They were nothing more than quacks blissfully ignorant of possibilities. Dr. Gest learned step by step the profession of feeding the public a diet upon which he could best fatten himself. Commentators say that he began as a newsboy on the street; then he was a ticket speculator, and later a producer of theatrical spectacles. It was when he mounted to the last position that he displayed signs of his inherent qualifications for the Doctorate of Doodle. He did not wait until he was ready to open the Century Theater with "Chu Chin Chow," which had been running for several years in London, to let his patients know what was in store for them. He told them months beforehand. He discounted any possible adverse criticism after the prèmiere by flooding the newspapers before that event with laudatory notices of the spectacle, the number of people it required, the amount of scenery, animals, and costumes it employed and above all the cost of the production to Morris Gest, D.D. These details were printed day after day, night after night, in successively larger letters. Each time the show was announced as the greatest thing ever presented in Manhattan. Weeks before the opening the Doodle-bugs had it so impressed on their minds that "Chu Chin Chow" was exactly what the doctor said it was that it would have taken dynamite to blast that impression out of their minds. There was no chance of failure, as the subsequent history of the thing proved. Dr. Gest had established himself in the eyes of the knowing ones as the only producer of stage entertainment who recognized that Barnum was right. He repeated the treatment with "Mecca" and "Aphrodite," but less successfully in a financial way. Without his highly scientific treatment there was nothing for either of these cases but box-office death. His genius as a master of publicity getting and holding alone enabled him to write down for these presentations something besides a total loss. He reached the summit of importance when he "put over" the Russian vaudeville show called "Chauve Souris" and the Russian stock company known as the Moscow Art Theater. He has scaled the pinnacle with Reinhardt's "The Miracle," which is now filling the Century Theater and getting priceless space in the newspapers and the magazines every day and week. The events leading up to the presentation of this last show represent either an extraordinary chain of coincidences or a use of Press-agent Doodle which is a classic.

Masterful Crowd Groupings

THE piece is a pantomime built by Max Reinhardt, a German-Jew stage director, around an old medieval legend which had been used by Maeterlinck in his drama, "Sister Beatrice." It tells the story of a nun Megildis, who ran away from her convent with a handsome young knight. She spends five years out in the world where she drains the cup of misery to the dregs, and returns at the end of that time to the convent. All the years she has been away her duties have been performed by the Blessed Virgin whose miracle-working statue has come to life out of pity for the unfortunate nun and a desire to keep the scandal from the religious community to which she belonged. Upon Megildis' return the Blessed Virgin resumes her state as marble image and no one except the penitent nun knows what has happened. There are nine episodes in the entertainment, most of them showing what happens to Megildis in her worldly career and exhibiting the tragedy that pursues everyone who falls in love with her. The other scenes, which grow very monotonous after the second display, are pictures of ceremonies in the cathedral where the nun was the custodian. The high moment of the spectacle is the opening which shows the procession of knights, nobles, peasants, ecclesiastics, the lame, the blind, and the sick streaming into the cathedral to implore the intercession of the Madonna whose statue subsequently comes to life. This is a colorful, moving, dramatic picture full of intensity, and indicates Reinhardt's magnificent grasp of crowd groupings.

When "The Miracle" was first staged by Reinhardt, the location selected was not Germany but Olympia, in London. Olympia is a super-Luna Park and the spectacle attracted hordes of people who turned out to see it because of its size, not its intrinsic artistic or dramatic worth. Subsequently it was presented all over Continental Europe but nowhere with such a preliminary fanfare as Dr. Gest blew for the Manhattan showing. Never was a prize fight "smoked up" more intelligently and successfully. The papers were full of the fact that the stage at the Century Theater was being made over into a real cathedral. The size and number of the stained glass windows, the yardage of the felt, linen, duck, asbestos, used on the stage, the amount of cable, the weight of the electrical equipment used, the size of the pay roll for the mechanical side of the production, all were announced with a solemnity that was overwhelming in its reaction. Noah building the ark never got half so much attention as Dr. Gest did for "The Miracle." Public interest was fanned to the pitch of excitement when it became known that two noble ladies were battling for the honor of playing the Madonna. They were Lady Diana Manners (Duff-Cooper), the celebrated English beauty, and La Principessa Matchabelli, whose stage name is Maria Carmi and who had played the rôle in the original London company. Lady Diana was announced as highly indignant when it was mentioned that La Principessa was to have the part at the Century Theater. La Principessa was pictured, in the press dispatches, as determined to create an international complication if she was not permitted to be the featured actress. From day to day the newspaper bulletins read like the ringside report of a prize fight. Needless to say when the time came for the stage acting the warring ladies halved the performing rights, the followers of their respective trains were delighted, and the curious mob naturally determined to see both celebrities act out for the purposes of making comparisons and conversation. In addition to these two inter-oceanic drawing cards Dr. Gest provided an American society girl, a member of the Pinchot family, to portray the character of the nun Megildis, with much valuable newspaper space about the lady's social standing and stage capabilities ensuing. Strange to say, all three have proved satisfactory in their characterizations though there is nothing in the histrionic content of any or all of them to warrant any large share in the expenditure of $15,000 for wireless messages, and cablegrams which Dr. Gest is reported to have spent in dickering with "foreign artists, musicians, and makers of scenery." The net result of all this Press-agent Doodle has been to pack the theater for what is summed up, nothing but a dignified torchlight procession in a stage church.

Gets P. T.'s Walking Stick

DR. GEST has been presented with a walking stick, once the property of P. T. Barnum, by a group of stage folk who admire and appreciate at their proper value the possession by Dr. Gest of the same talents which made Barnum "the king of showmen."

Dr. George Bernard Shaw, as already stated, uses a slightly different formula when making up his brand of Doodle. "St. Joan," which had its world prèmiere in Manhattan under the sponsorship of the Theater Guild, contains more than the usual good measure of Shavianism. Joan of Arc was for centuries the inspirational name in the national life of France. Even the mad fanatics of the anti-religious political element in that country were wise enough to keep their desecrating touch off her. Plays, novels, essays, and psychological analyses by the score have been made about her. That incorrigible satirist, Mark Twain, wrote a life of her which pulses with genuine reverence. The Catholic church after hundreds of years of investigation, through the successive stages of venerability, beatification, and canonization, has enrolled her name on its list of saints. It has remained for Dr. Shaw to make her the target of his ribald attention. He has given us a saint with her halo cocked rakishly over one ear, as gabby as a barmaid, and as slangy as a Broadway "hick." She calls the English "goddams," she barges like a fishwoman at the lollypop-sucking youth she is ordained to place upon the throne of France, and behaves herself generally as any saint of Dr. Shaw's making would be expected to do. This effort at humor cannot help but fill with irritation those who have a respect for decent tradition and the established facts of history. Scholars generally concede that Beauvais, the rascally French bishop who ordered Joan burned at the stake, did so at the insistence of English politicians who demanded her removal as a trouble maker, and that the religious tribunal was used as a means to an end which, while it brought the death of The Maid of Orleans, resulted in Beauvais' excommunication and punishment by his ecclesiastical superiors.

A Shaw Standard Set Up

HISTORIANS, irrespective of religious inclinations or lack of them, long ago found out that Beauvais belonged to the species we have with us today. He was a crooked judge acting as a tool for unscrupulous interests. Dr. Shaw, however, making up his Doodle, has decided that Beauvais was an honest fanatic who ordered Joan burned because he discovered in her the first Protestant and because he believed he was performing an act for the good of the Church when he ordered the match applied to the faggots.

No doubt the patients of Dr. Shaw are quite satisfied with the various wallops he has taken at all the accepted traditions connected with what he would probably describe as "the Joan of Arc myth." He has set up for their satisfaction an entirely new standard whereby candidates for

(Concluded on page 14)

The Mexicans: Sickest People in the World
Help Should Be Offered to Our Neighbors

Handicapped in Race for Life Because of Climatic Conditions; Nevertheless There Is Much That Can Be Done to Aid Nation

By HELEN BOWYER

SICK people are likely to be capricious and explosive and sensitive to a degree that makes it difficult to deal with them. And if we have found the Mexicans all of this, I wonder if it would not be well to look for the causes further back than Villa raids and gob arrests and Article 27 of their new constitution. Back of constitutions, back of banditry, back of all the conflicts of their ideas with ours and those of other nations, stands the state of the health of their people, a state of health so pathetic that not only "to understand is to forgive,"—it is to want, and want desperately, to do something about it.

Think of a national vitality so low that not half the children born ever live to see their seventh birthday. Think how rampant is disease when the average length of life is only fifteen years. And what kind of statesmanship can we look for from a people scarcely one-fifth of whose men and women reach the age of forty years?

International

This is an outdoor restaurant in Mexico City. Note the ragged, barefoot peons on the right eating their allotted portions from the big pot shown in the center.

Typical Mexican Indian.

Nature has been kind to the Mexican. And she has been cruel, insidiously cruel, Delilah cruel. In that great sun-drenched central valley whose blue walls enfold half the fifteen millions of him, she has lulled him with lotus dawns on lotus dark to an apathy where disease and dirt and vice and ignorance meet but the puniest resistance from him. For the *Valle de Mejico* not only fails to give man that range of changing heat and cold he needs for energy —it holds him at a level of a mile and a half above the sea, 5,000 feet higher than the upper limit at which he functions best. So the Mexican is handicapped in the race for life and health, but not so handicapped but that with our help he could attain to them.

We cannot change the altitude, we cannot change the sameness of day and night, of summer, winter, spring and autumn. But given public sanitation and personal hygiene, given more food and less *pulque,* given vaccine and quinine, he can stand the altitude and the monotony of climate and be so happy and so lovable, so loyal and so capable that it becomes a tragedy that he should not be in condition to be so all the time.

First among the ills with which the Mexican is sick are those of the digestive tract. Among the upper and middle classes, the *estomago* is a never-ending topic of conversation. Among the poor they die of it like flies, especially the children.

"And what had the *niño*" we would ask the barefoot mother of the dozen peasant villages through which we gathered data on child mortality.

"*Enfermedad*—sickness," she would answer, drawing her blue head shawl still closer, still more smotheringly over the face of the dead babe's tiny brother and pressing it yet deeper into the hot pillow of her breast.

But it took very little questioning to discover that in four cases out of five the *enfermedad* that had killed the child was some form of stomach trouble.

It was incredible, it was appalling, it showed a level of maternal mal-practice beyond anything we could have expected. For the babes in these peasant villages were all mother-nursed and in our country, mother-nursing practically insures a babe against death from digestive disturbance. But against that *reboso,* that lovely, dirty, germ-laden shawl, prisoning him hour after hour against an idolizing bosom, cutting off the light and air so vital to assimilation, there could be no insurance for the child of any race. Nor could there be insurance against the smoke of the household fire. The Mexican household fire is unbelievable, primitive to a degree one could not dream of outside the South Sea Islands and deadly to the verge of suicide and murder. A clutter of stones on the bare earth floor of an adobe hovel, a few smoldering sticks, a litter of earthen cooking jars, often crudely beautiful, a woman squatting among them, pat-pat-patting *tortillas*—the immemorial maize bread of Mexico—between her slender hands, a man, a child, perhaps an old father squatting near her, munching the thin disks as she takes them from the fire, and above, swung by the adoring hands of one or other of them, the *niñito* in his *cuna,* in his dirty little canvas hammock, slung from wall to roof prop in the thickest of the smoke. It is perhaps nine in the morning, in the halcyon Mexican morning, and from mountain wall to mountain wall the land lies flooded in the light and warmth of the life-giving sun. But in that adobe tomb where no ray can penetrate save through the chinks in roof or wall where the smoke is vainly trying to escape, one shivers with dank chill and backs out through the torn door curtain, choked and blinded, and wondering how it is that *any* child survives.

In our country when a mother has brought her baby through his first hazardous twelve months, she may draw a long deep breath; statistics show her that the worst is over. But in Mexico the worst is just beginning. For the child who has survived the *reboso* and the smoke of the nursing period has in store the *tortilla,* the *frijol,* the *chile* and the *pulque* of post-weaning days. Whether —if they could get enough of them—cakes of maize and water and beans cooked with grease and tongue-destroying peppers, would make an adequate diet for Mexican adults, may be a moot question, but the answer as regards the children is written out all over the republic yearly in thousands upon thousands of needless little graves. The death rate in the second and third year dwarf even the appalling figures of the first twelve months of life. All told, the child mortality throughout these dozen peasant villages averaged fifty-three per cent. And this region ranked among the most salubrious in Mexico.

And the survivors? What of those whom neither the *reboso* nor the smoke nor the national diet could kill off? It would seem that children tough enough to live through them could live through anything that might come later. But the tragedy is that they have *just* lived. The ordeal that killed their brothers has left them depleted, easy victims to the next onslaught of death. In the region of our tour, death comes in the form of malarial fevers. In one village every house at which we called had one person, child or adult, down with it. In the *Valle de Mejico,* the great scourge is disease of the respiratory system—there the death rate from pneumonia is probably the highest in the world. Tuberculosis is everywhere, everywhere is the pitted face of smallpox, and in the last villages, those that led downward to the "hot lands," began the colorings and the growths of strange tropic sicknesses for which we knew no names.

Ill health among ourselves is far more prevalent than it should be. But after all it is the exceptional thing, for we are well enough to be daily at our business. In Mexico it is not so. Ill health is taken for granted and life, a maimed and half-geared life, drifts on in the expectation that it will be delayed and checked and frustrated by disease. Your most pressing affairs are held up a maddening length of time because the government official whose signature is necessary is at home in bed. The children in the public schools repeat their grades to an extent that would bankrupt our boards of education, and mostly because of weeks lost through illness. And even in the evening classes for *señoritas* you cannot exact punctuality, because when Concha or Angelita gets home from work she is likely to find her mother sick and to have to stay a while to care for her.

On the streets the evidence of this universal morbidity sickens you at every corner. Distorted features, twisted feet—the horrible results of early malnutrition—the face of childhood blotched with loathsome sores, the sightless eyes of babes . . . there is no attempt to hide them, Mexico has not yet reached the point where she is consciously sensitive as to these things. But subconsciously she reacts to her ill health with a sensitiveness that is tragic, that will destroy all that is big and fine and gracious in her unless she can conquer it. That secret sense of inferiority toward the foreigner, which is at the root of her defensiveness in matters international—how much of that may not be due to her lack of mere animal well-being? The foreigner comes to her well-fed, up-standing, with clean blood, with steady nerves, and with health habits that enable him, even in that unaccustomed climate and at that unwonted height above the sea, to work all around the Mexican and win from him everything not fenced in by protective legislation or anti-foreign propaganda. Is it any wonder that he puts up fences? But how much better it would be for him and for us and the rest of the world, if, instead of hiding his inferiority complex behind defensive bars and defensive explanations, he would face it . . . . and eliminate the causes of it. And that the cause which dwarfs all other causes is this universal, will-drugging, energy-destroying ill health, few who have entered into Mexican life will be found to question.

Is Mexico herself doing nothing about it? Yes, the Department of Education is providing breakfast for ten thousand underfed school children in the Federal District. The Departments of Health and of Public Charity maintain various hospitals and services and the Department of Agriculture sent out the expedition through the peasant villages spoken of above. There are private foundations, too, which operate hospitals and clinics, one of them still functioning under the will of Herman Cortes. But never, never, never, will work along just these lines meet the situation. Nothing short of a crusade will do it, nothing less than a campaign based on a well-planned survey and organized to call into co-operation "every Mexican of good faith."

Such a crusade the Mexicans cannot organize unaided, not yet, at any rate. They have neither the experience of their own, nor the trained minds—trained along this line, that is—to utilize the experiences of other peoples. But we have the experience and we have the experts. And, in case of need, we have the money to set them to work.

We are pouring it out in Europe, in China, everywhere except among the people who are sick and hungry and disheartened right on our own border. "Adventures in international friendship" we call the gifts—the gifts of bread and shelter, schools and leaders—we are sending to the peoples far away. And an adventure in friendship indeed, perhaps the biggest of them all, would be that which would bear the gift of health to the neighbor at our door.

Co-operation in the Baltic States and Poland

Drift in Four Republics Visited Declared to Be in Favor of Organization

By HUSTON THOMPSON

WE WERE leaving Finland. Our small vessel steamed out of the rockbound harbor of the city of Helsingfors, pointing its nose toward the south, across the Gulf of Finland, where lay Esthonia. Of that country I had perhaps no more knowledge than Stanley had of "darkest Africa" before he entered it.

Approaching the sandy shores of Esthonia, we saw to the left of us in the haze three massive British cruisers. They were perhaps keeping guard over little Esthonia in the event that the Russian Bear should determine suddenly to try to swallow this new nation.

Esthonia, Latvia and Lithuania are pyramided one upon the other in the order named and rest on Poland. They offer a laboratory to the world where men may now go to study and learn what is being evolved out of the recent chaos. The peoples of these nations are waging one of the most interesting economic battles that have ever taken place. In their struggle they are using the co-operative societies as one of the great instruments by which they hope to bring about a victory.

The contest is one that has been fought out from time immemorial. In fact, the ancients have embodied it in one of their mythological stories in which the chief character was Antaeus. He was a giant who compelled all strangers to wrestle with him. When thrown, he received fresh strength as he touched Mother Earth. Victory was his until Hercules, discovering that he lost his strength when off the ground, lifted him up and strangled him in mid-air.

Land Barons Driven Out

HUMANITY has often been taught the lesson that man dies when taken away from the soil but has seldom profited by it; less so perhaps in modern times than ever before.

The war also gave these peasants the opportunity to drive out the German land barons, who though few in number had in the distant past separated the peasants from their title to the land until the barons controlled more than fifty per cent of it. Despite the fact that Russia carried away most of the farming machinery and destroyed farm buildings on retreating from the German army, and the Red army had mopped up what was left, the peasants of these nations, through the assistance of the co-operative and their governments, are going back to the soil and are erecting a new civilization on a "shoe string" with a land hunger that is almost ferocious in its intensity.

We have often heard it debated as to who won the war. After seeing the Baltic republics I am prepared to hazard the statement that the farmer, and the city toiler who is now becoming a farmer, were the victors in the Baltic.

Just as Denmark won its armageddon when, on finding it could not compete with American farmers in the production of grain, it turned to dairying and fed its cattle with American grain, so these new countries with their industries destroyed are not turning back to industry but are going out to the soil. The city of Riga presents a case in point.

Previous to the war, Riga had 93,000 artisans occupied in her very active industrial plants. She was the center of the production of rubber footwear for Russia. The Russian retreat denuded the city of every manufacturing plant. All machinery and metals, even the church bells and bronze statues, were carried away. The city shrank from its pre-war population of more than 700,000 to approximately 350,000.

At this juncture there took place a remarkable occurrence in this great economic laboratory. Sixty-two thousand artisans left the city and were given farms of approximately fifty acres each. The authorities told me that not to exceed ten per cent have returned to the city.

I was told by officials that they were not encouraging the thought of industrialism, but were turning their minds toward making Latvia an agricultural nation after the pattern of Denmark.

The Return to the Land

REMEMBERING that thirty years ago seventy per cent of our people lived on the farms or in very small towns, and that today only forty-eight per cent live on farms or in towns of less than 2,500, I could not help contrasting our situation with this Northern European condition where the whole mental processes of a nation are directed back to the farm.

As I watched these people struggle to get back to nature's first principles, with practically nothing to begin on and plenty of obstacles to surmount, the story of the Tower of Babel continually recurred to me.

The moral of this story is that the Creator did not want all of his people to think along identical lines, for that would mean the end of individual and group aspirations. Those ancients performed according to prognostication. Having congregated in a city they started to build up to the heavens instead of spreading out and retaining a hold on the soil, and as I am writing this the thought comes to my mind that the greatest commercial city of the United States is reproducing a picture in its growth.

When the Latvians saw the destruction of the industries of their beautiful city, they did not try to restore their Tower of Babel, but scattered out over the soil of their native land. Undoubtedly in the future they will manufacture in the cities only those things which are necessary for the people of their nation, for the consumers' co-operative movement in Europe which now has such a hold there does not lend itself to local overproduction.

The same situation will prevail in Esthonia and Lithuania. There has been a slight drift toward industrialism in Esthonia, but the population is so predominatingly agricultural that such a movement has not approached the danger point, while Lithuania is almost exclusively agricultural.

One cannot escape encouraging signs in Esthonia and Latvia where reconstruction is certainly on the way. It has been seriously halted in Lithuania because of the disputes over territory between Lithuania and Poland. In both the latter countries there is the additional handicap due to the fact that the percentage of illiteracy is higher than in countries like Denmark where it is practically non-existent and because of which co-operation has been so successful.

In Esthonia and Latvia they have attacked the land problem with great energy. With the German barons driven out of the country, they have been busily engaged in staking out their fifty-acre farms and, just as rapidly as it is possible, the lands are being taken up.

In Poland with so many of her male population withdrawn from the farms and industries into a large standing army on the one hand, and her population shot through with propaganda of various kinds, the co-operative movement, which was dealt terrific losses during the war, has been greatly handicapped.

Nevertheless, one of its leaders, Leonard Dembinski, states that since the independence of Poland was declared co-operation has gained rapidly. There are about 360,000 families belonging to the consumers' societies. This would mean 1,800,000 persons are obtaining their necessities through the co-operative organizations. In a sense this movement has been acknowledged by the nation since the people have elected to the presidency of the republic M. Stanislaw Wojciechowski, a pioneer of the Polish co-operative movement, who was, at the time of his election, a director of the Polish co-operative union.

I was in Poland at the beginning of the harvest season. Nowhere in Europe, nor for that matter in America, have I ever seen finer crops. I was told that they had splendid up-to-date machinery on the great estates, with which they harvested their crops. All the harvesting I saw was being done with a scythe, the men cutting the grain and the women following behind and bundling it into sheaves.

Peasants Hard at Work

THOUGH it seemed to me that some of the city population was not doing much work except in the factories, I was impressed with the hours of the peasants whom I saw at work at daylight and continuing during the long twilight. The male peasants frequently wore shoes, but the women never did. The cottages in which the peasants resided were frequently in as bad condition as the poorest thatched roof homes that I saw in Ireland.

Poland has some splendid laws covering agrarian reform but I was told that owing to the conditions confronting the nation, there has not been great progress in the administration of them. Until there is a peaceful state and a return of the soldiers to the soil, the co-operative movement as well as all other business will advance slowly.

Independence of thought in the Baltic republics reveals itself in many interesting ways. As in Finland and Sweden, their parliamentary bodies are composed of from ten to twenty different blocs, such groups being made up from all classes.

It is difficult to imagine where these Baltic nations would have been today were it not for what the co-operative movement did in the crucial hour, and has continued to do. As in Latvia, so in Lithuania and Esthonia, most of the wagon bridges were destroyed so that traveling any distance by automobile was impossible; the roads were fearfully rutted; the cattle carried away by one or the other of the invading armies; railroad bridges blown up; farm machinery practically wiped out; many farmhouses razed; industrial plants completely ruined and food at a famine stage.

In Latvia there was no other means of distribution in sight upon which the American representatives could depend. So when the supplies which were sent up from our army stores in France, such as shoes, clothes and flour, arrived, I was told by Mr. P. Seezeneek, the Director of the Central Consumers' Society at Riga, that they were turned over to the co-operative organizaions for distribution. It must be kept in mind that these co-operatives had suffered just as much if not more than other organizations, for their property, too, had been destroyed, their stores burned down and their officials driven into exile in foreign countries. But there was still the spirit of the organization and its machinery left.

Director Seezeneek informed me that the American supplies were the only thing that saved Latvia. He added that they also saved the co-operative organizations, for the reliance placed upon them by the Americans acted like an electric tonic, since it put the stamp of approval upon them before all the people as the agency of reconstruction.

All three of the republics have splendid forests and reasonably fertile soil. Esthonia has exported, in the past, flax, butter, potatoes, cement, alcohol, metals from mines, and it manufactures cotton goods, paper and furniture. Its artisans are known in Northern Europe to be unusually skillful and because of this and the fact that they are not numerous, there is very little unemployment.

A large proportion of the commerce of this small nation, which is about the size of Massachusetts, is carried on by the co-operatives. In fact, during the years 1921 and 1922 fifty per cent of all the goods sold in Esthonia was handled by co-operative societies. The societies which sell the farmer's produce and also handle the articles which he exports are of a similar strength. The Esthonians have no trouble bridging the chasm which seems to exist in some other countries between the Consumers' Co-operatives and the farmers' distributing co-operatives.

Their consumers' wholesale society has 255 local societies allied with it. These have 94,732 members and in addition there are other allied societies which make a total membership of more than 100,000. If we follow the customary method of considering that each member represents a family of five, then practically one-third of all the population is in consumers' societies, for there are only 1,300,000 persons in Esthonia.

Co-ops Own Distilleries

IT IS interesting to note that the credit and savings banks of the farmers' co-operative movement have come through the recent chaos with considerable credit to them since the co-operatives' money having stayed invested in the country was to a great extent saved, while much of the nation's money that had been invested in Russian state banks was lost.

I commented in my article on Finland on its being a dry country. I cannot say the same of any of the three Baltic republics nor Poland. The potato industry of these peoples derives much of its impulse from the fact that it is used in making vodka. A number of co-operative societies and farms have distilleries. They are almost as frequent as silos on American farms. The farmers band together in co-operative groups for the purpose of manufacturing this oily white fluid which "biteth like a serpent and stingeth like an adder" as it slips down the throat.

Latvia's co-operative societies show perhaps even greater advance than those of Esthonia. In their national consumers' society, to which many farmers belong, there are three hundred local organizations located throughout the nation.

This little country containing approximately 24,000 square miles has eighteen agricultural schools, similar to those in Denmark, strategically located. In them courses are given during the winter. The co-operative associations have built their plants but the government pays the salaries of the teachers.

The co-operatives are copying Denmark even to the point of importing the Danish red cattle, a number of which we saw through the country.

Just as in the early pioneer days of America, a farmer's friends set aside a day in which to help the newcomer to raise the frame of his house, so the farmer members of the co-operatives assist each other in the construction of their houses. They get part of their funds for building through the co-operative societies which in turn are assisted financially by the government.

Machinery is so expensive and there is so little money among the farmers that they come together in groups of twenty and combine their resources. When they have secured from twenty to forty per cent of the value of the farm implement they desire, they approach their co-operative organization. It advises them of the type of machinery they will need and advances them the additional amount required for its purchase. The same method is duplicated in the purchase of other needs of the farm.

Diversified Crops Tried

THE land of Latvia which has been wrested from the barons and subdivided into small farms has produced a very significant result. Instead of clinging to the idea of one or two types of crops, the small farm has brought about a diversity of occupation. Where formerly only a corn crop was raised, the peasants have gone also into cattle, poultry, pig raising and other farm occupations.

Representatives of the three Baltic republics, so we were informed, have already been holding economic conferences and trying to formulate plans for an interchange of business. But the instability of the value of their money has been holding them back. The co-operatives, nevertheless, are interchanging information. It would not be surprising to see the societies of the three countries eventually form a single organization for the purchase of their necessities, such as has already been formed by Sweden, Norway and Denmark.

Meanwhile, the drift in all of these countries is toward the co-operative method of buying on the part of the consumers and selling on the part of the farm organizations. Dire necessity has forced the situation and will accelerate it for some years to come. Effective co-operation is with them first a matter of spirit and then one of business. To see these people in their parks in the evening listening to excellent music from bands or engaged in pleasures of a simple character such as dancing on the ground in front of the band stand with a lack of self-consciousness that is delightful, or coming together from all parts of the nation by thousands to their capitals to hold great song festivals where they render magnificent choruses and give utterances to all of their folklore in songs, bespeaks a spirit of true social co-operation.

Lumberjack Poet of the Pines Once Painter and Salesman

Enos F. Hayward Turned Settler to Satisfy Love of the Wild

By FRED L. HOLMES

THE poet of the North Woods, who had hewn a home out of the wilderness, sat by his fireside musing and writing the words of his songs about nature and man. Winter had settled over Northern Wisconsin and Michigan. From the windows of his log homestead stretched an expanse of cut-over acres, sheeted in snow, crusted and touched to glaring, dazzling, reflecting brightness by a sunlight that sparkled and blinded in the crisp midday air.

The thick undergrowth that furnished an endless vista of dark greenery in the summer, lay snug under the spotless mantle. Along the roadside the snow had been piled into heaps by the winds. Deformations of landscape, matted bushes and the rotting carcasses of fallen trees had been turned by their white coverlet into ugly and grotesque forms. Tall, leafless trees, with stubby, broken branches—scarred sentinels of a burnt-over area—towered in decaying loneliness over the verdant second growth of interlocking hemlock and pine boughs. Far away in the forest the measured stroke of woodmen's chopping reverberated like the incessant drumming of the partridge that make their home in the chaparral in summer. The northern woods once had their aristocracy, but the axe of the lumberman has laid them low. The lords of the wilderness are fast disappearing.

Only along the roadway, or on the waters of the lakes, a few rough settlements have gnawed slight indentations into the expanding horizon. A little farther inland dismal clearings have been made about the lumber camps, letting sunlight into spots that have stood in the shadow time out of mind.

Enos F. Hayward, hailed by his fellow pioneers as the lumberjack poet, lives in this solitude vastness. He likes the life in Northern Wisconsin:

> "I love the winter's chilly blast,
> The snow and sleety storm;
> But love them most when they have passed
> And it is nice and warm."

"The last house in Northern Wisconsin on State Trunk Highway No. 32, six miles from the Upper Peninsula of Michigan," was the direction which Mr. Hayward gave me in his letter of invitation.

More than twenty years have passed since he chose the location. Roads have come in the meantime, turning the narrow trails through the brush into highways; tourists have swarmed to the lakes in summer; lands have been cleared and acres planted to crops.

"Being a nature lover and instinctively a pioneer, I chose my present location as an ideal place to live and die," declared Mr. Hayward. "In 1901, I homesteaded eighty acres of jungle two miles north of Conover. I have cleared about seventy acres and all was hand work; fenced all and built several cottages and other buildings, mostly alone."

Mr. Hayward follows the instincts of his parents in their career as pioneers. They came from the New England States to settle on the prairies of Iowa in 1855. It was in La Fayette County, Iowa, that the future poet was born, August 21, 1866.

"I learned the trade of painting and decorating at 18 and followed it for several years," explained Mr. Hayward. "Following this I took a position as a commercial traveler, which I held for a number of years. It was while making the small towns in the northern country that I determined to find some spot which would make me an ideal home. After I had located it, I did not give up the road, but spent such spare time as I had clearing the land and erecting log buildings."

In 1905, when he met with an accident that required a protracted rest from traveling, he quit the road and has made Haymeadow Farm his permanent home since. He had already been dabbling in poetry and a little booklet, "Two Bits," had enjoyed a sale commensurate with most books of poems. While recovering from his injuries, he translated his wilderness experiences into other poems, with the result that "Philosophy in Rhyme" was issued.

There is a grim determination in his homely philosophy. The homily of admonition is there. Here are some straws found floating in the poetic stream:

Crowd into your life the goodness that is within you.

Of your promises be sparing, they are hazards at the best.

Do not give up hope and plead ill-fate.

Your conscience is like a faithful old dog. It follows wherever you go.

Troubles and hardship may help win the race.

Never admit you are down and out.

Strength will be the gain and friends, too.

The bravest heroes in the world are those who fight alone.

Another day may bring relief and you'll be glad you waited.

The tempter lurks on every hand to try and thwart your plan.

The cravings for applause and fame are won by some with little effort, while others meet only disappointment.

Don't count the cost of things you've lost but prize the things you've won.

The darkest night can only stay at most a little while.

Kind words and good acts are seeds which will pay.

One of his own short poems may illustrate his viewpoint of life:

HELLO—GOODBYE

"Life is like a railway station,
With its busy hustling throng;
Full of life and animation,
Hope and sorrow, tears and song;
Some are waiting, watching, praying,
For some loved one to appear;
Others sad farewells are saying,
To some friend, who's leaving here;
Some are coming, others going—
Some will laugh while others cry;
His emotion each is showing,
Caused by Hello, or Goodbye."

Through his poems will be found a philosophy of kindness and cheer; a longing for simple and "old-fashioned faiths." "Back to Nature" is one of Mr. Hayward's shorter poems in which he says:

Above—The lumberjack poet as he appears on his farm.

Left—The home of Mr. Hayward on Haymeadow Farm, where his poems are written.

"I love to dwell in forests wild,
Where giant pine trees pierce the sky;
A beauty spot where Nature smiled,
A fitting place to live and die;
Where lake waves kiss the sandy beach,
The native haunt of timid deer;
A sermon only God can preach,
But every Human Soul may hear.

"The book of Nature opened wide
Each page some wondrous joy unfolds
To him, whose conscience is his guide.
He learns the secret Nature holds.
I've played my part in life's strife;
So let me put aside my cares,
And live the quiet, simple life."

ENOS F. HAYWARD

HELLO, SPRING

By E. F. Hayward.

Hello, Spring! I've been a wishin'
You'd be amblin' 'long this way;
I'm jes itchin' to go fishin',
Benn a watchin' ev'ry day.
Knowed you'd come along to cheer us
Like you always used to do;
Pitch yer tent an' camp right near us
Fer we're mighty fond of you.
Jes' lay off yer Easter bonnet,
Make yerself at home right here.
Whar's that fish-pole now, doggone it!
That I put away las' year?
Never mind, I'll cut a willer;
'Taint no time to fool around.
Ketchin' trout is sure a thriller
Fer a real ole' fishin' hound.

Many have been the cares and worries of the poet of the pineries. For nineteen years much of his time has been given to the care of an invalid wife, to whom his recent book, "Poems of the North Woods," was dedicated. The volume was issued a short time before her death. Until the publication of this book little had been realized by him from the sale of his writings. He has been living the life of a real pioneer, depending entirely upon hunting, fishing, berrying, wood chopping and the operation of his farm, to furnish a livelihood. Vilas County, where his clearing is located, is fruitful in midsummer with luscious blueberries. The Indians, who are expert pickers, make a part of their living that way.

"I am considered a pretty fair picker, even by the Indians," Mr. Hayward laughs. Last year he picked and shipped more than 1,000 quarts in addition to 300 quarts of other wild berries.

A part of his time during the winter he spends in hunting. A year ago he shot foxes and wolves, and the bounties offered by the state and sale of the furs brought him more than $200. He roamed 1,300 lakes and threaded the ice sheets of nearly 300 streams for bear, wild cat and similar fur-bearing animals.

Also there is wood to be chopped and sledded to market. Every year he cuts and hauls a distance of about six miles two or three carloads of spruce logs. During the winter months he hikes hundreds of miles. The North Woods are a dooryard to him.

"There is seldom a day," he says, "when I don't walk at least ten miles, and most days I walk much more."

With the opening of spring come the tourists. He has put up a little cottage on Stormy Lake, which is widely patronized. He calls it "Honeymoon Lodge" and built it, he says, "for newlyweds who wish to hide away from charivari parties." Some of his time in the summer is spent guiding the tourists to the scenery of the northland, showing them the best fishing holes.

After a hard day's work he sits down in the evening when the chores have been done to ponder some thought and fashion it into poetic lines. Most of his writings have been done in the winter months, when the cares of the farm and the calls of the wild are less compelling.

The success of his recent book of poems came as the result of a chance acquaintance. William F. Zimmerman was for eighteen years president of the McClurg Publishing Company. Except for a few weeks in the summer he spent his time in Chicago's printing establishment. Weeks in July and August were spent in Northern Wisconsin. One day Mr. Zimmerman noticed a poem in a local paper. It was not the scholarly verse, but the homely philosophy, breathing the scent of pine trees and the aroma of lakes and cut-over lands, that held his attention.

"I want to meet that man," said the publisher. "Where does he live?"

A few days later the Chicago man found the Hayward log cabin. No one was at the house, but there was a "Welcome" mat on the doorstep.

So he waited. An hour later a man rounded the thicket into view. Across his shoulders was a spar, on which hung two buckets such as a Holland milkmaid

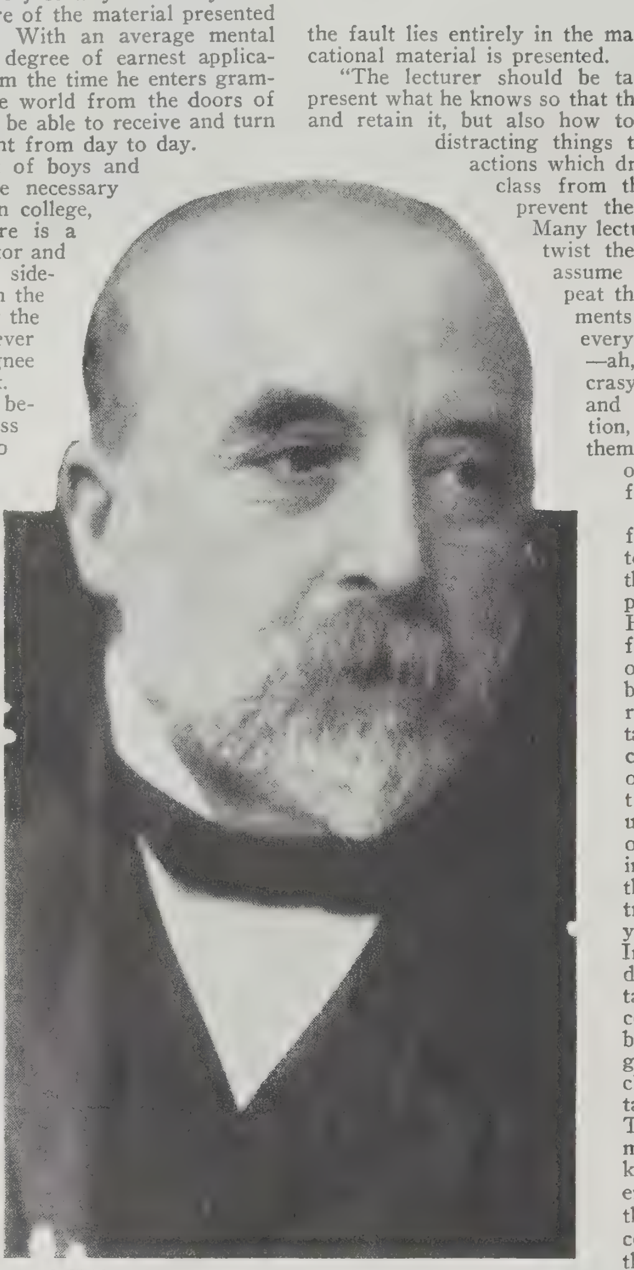
Teaching the Professor How to Profess

Teachers Must Be Taught How to Teach as Well as What; Responsibility for Heavy Percentage of Flunkings Up to Instructor

By HARRY H. DUNN

THE majority of American parents have wondered more than once during the educational years of their sons and daughters just why these boys and girls were not absorbing more of the material presented to them by their teachers. With an average mental equipment, and with a fair degree of earnest application, the American youth from the time he enters grammar school until he faces the world from the doors of his chosen university, should be able to receive and turn to use that which he is taught from day to day.



DOCTOR JOHN ADAMS, M. A., B. Sc., LL. D.,

Professor of Education at the University of London, and Emeritus Principal of London Day Training College.

The constantly growing list of boys and girls who fail to make the necessary grades in high school and in college, however, indicates that there is a vast loss between the instructor and the pupil, a sort of mental sidetrack, as it were, down which the trains of thought sent out by the teachers are shunted, and forever lost to the pupil—the consignee of their cargoes, so to speak.

Education experts are beginning to believe that this loss is not entirely chargeable to the pupil; that at least part of it is the fault of the teacher. From this is growing the thought that perhaps our teachers—from the normal school graduate who handles the primary grades to the lecturer on the college and university platform—are failing to get over to the boy and girl the lessons they are aiming to teach. Men and women who have made a lifelong study of education have come to the view that the teacher must be taught *how* to teach, as well as *what* to teach; that some who are lecturing should be teaching classes; that some who are teaching should be doing research work, that is, providing material for those better adapted to transmit it to the pupil; and that many who are teaching should themselves take a comprehensive course in methods of presenting ideas to the classes which come before them, so that each pupil may grasp and retain exactly what is offered.

This is a serious situation. It probably is responsible for the "flunking" of thousands of boys and girls from our high schools, colleges and universities, and while we in America are only beginning to consider that all educational failures are not the fault of the pupils, some British educators have been working on the problem for years. In one of the colleges of the University of London, even before the war, time was devoted to the teaching of young would-be professors how to teach. From that university this year, one of its professors, Dr. John Adams, is traveling slowly around the world, lecturing in many universities in each country he visits, on education in general, and specifically on the teaching of teachers how to teach.

Knowing and Teaching Different

"IT IS one thing to know and quite another thing to teach," said Dr. Adams, who, by the way, is also Emeritus Principal of the London Day Training College. "That remarkable man, Lord Kelvin, whose knowledge was as wide as the world and as deep as the sea, was not a good teacher, in spite of his knowledge, and I speak from experience, as he was my own teacher. We who studied under him learned in spite of his methods of teaching, rather than because of them. In other professions, the apprentice serves a long term of training before he steps out into his life work, yet the professor, immediately on graduation, begins to profess, steps immediately into his chair as professor of this or that, when, often, he either has no training or experience in teaching, or is far better fitted for research work than lecturing or teaching.

"Mere scholarship is not enough to make a successful teacher. The born teacher, the men and women with natural ability to impart to others what they have learned, form only two and one-half to three per cent of our teachers today. The ordinary man who essays to teach may, and very often does, begin by spoiling his first class, and continues by getting his own training at the expense of the students under him, so that these early students are considered incompetent because they do not absorb mentally his teachings, when, in reality, the fault lies entirely in the manner in which the educational material is presented.

"The lecturer should be taught not only how to present what he knows so that the pupil may comprehend and retain it, but also how to eliminate the curious, distracting things that many lecturers do, actions which draw the attention of the class from the lecture and actually prevent the pupils from learning. Many lecturers twirl their pencils, twist their fingers, move about, assume awkward positions, repeat their statements, or fragments of them, begin or end every statement with 'ah—ah—ah,' or some like idiosyncrasy, which at once attracts and holds the pupils' attention, and eventually makes them restless, and puts them out of all frame of mind for learning.

"The prospective professor should be taught to profess; to explain, by the actual process of exposition and illustration. He should be fully informed as to the order of presentation, so as best to aid the student in remembering what is taught. He should be conversant with methods of illustration, so that each illustration used remains in the mind of the student, picturing clearly the idea that the lecturer or teacher is trying to impress on the young minds before him. In the University of London, I have for years taught a class for young college lecturers. The brilliant students in this group at first were inclined to resent being taught how to teach. They fell into the common error that mere knowledge of a subject enables a man to teach that subject. In this course, however, we have the young men give lectures to each other, these lectures being criticized by the other members of the class. This criticism corrects mistakes made by the lecturers; enables them to see and eliminate annoying habits while speaking, and informs them directly whether or not they are handling their subjects in such a manner that it is intelligible as well as interesting to their hearers. The young lecturers take criticism in a friendly way when offered by their fellows, though they might resent it when coming from an outsider. From this class have gone out some of the best college and university lecturers I have ever known, not only because they knew their subjects, but because they knew *how to impart their collected knowledge to others.*

"It is a fact not commonly known except among educators that a man who knows comparatively little or nothing about a certain subject can teach experts in that subject how to impart their knowledge to others. For example, during the war I was at the front lecturing to officers in schools of gunnery, engineering, aviation and other branches about which I knew very little, my business being to teach these expert officers how to transmit what they knew to other men. Bernard Shaw has said, 'He who can, does; he who cannot, teaches.' But Shaw does not realize that teaching is an art, a business, a profession, in itself. Therefore, why should not the teacher be taught how to teach. Without being able to shoot or build bridges or fly, I was able to show gunners and engineers and aviators how to teach what they knew and I did not.

The Old Days—and Now

"IN THE old days, 'M. A.' meant 'qualified teacher,' in Oxford, in Paris, and at Bologna. The degree conveyed the *jus ubique docendi*—the right to teach in any university in Christendom. The man seeking a degree became professor by professing. He prepared a verbal thesis, delivered it, and maintained that thesis all day in argument with all comers. He was taught not only his subject, but how to defend it, how to argue for it, how to transmit it to others. Today, the graduate writes his thesis, possibly reads it, does not have to defend it, or even to impress it on his hearers, but can step directly out of the halls of study into a lectureship or a professor's chair, altogether untrained in compact argument.

"The truth is that the successful teacher or lecturer must be able to sit at the same time in the professor's chair and on the student's bench. He must be able to put himself into the other fellow's place, and to realize that he is telling the other fellow something the other fellow does not know. He must convince the student, and to do that he must be able to think as the student thinks. He can obtain this ability only through the study of methods of teaching. It is as important that the professor be taught how to teach as it is that the pupil be taught how to study.

"In many cases, the teacher or the lecturer is 'shooting over the heads' of his students in the course. There are three things the teacher must learn if he wishes to hand on to the next generation the accumulated knowledge of his own:

"First, he must get the mental background of the student. The professor is not necessarily brighter than his students; his mind merely is more mature and has achieved a greater mental content. He must present everything to the students against the mental background of their minds, and to do this he must be able to put his own mind in the place of theirs. Minds are rigid, fluid, or plastic. The rigid mind is incapable of change; the fluid is always wobbling about, from subject to subject and from thought to thought; the plastic is fixed, or becomes fixed, in an opinion, but can be changed by argument, just as clay can be molded, and, once molded, retains its shape. The plastic mind is the best and easiest of all to teach.

"Second, the teacher must learn to present his facts in such order as to appeal to the pupil, and to arouse and maintain his interest. This need not be the 'logical order,' but such sequence as will make the greatest and most forceful argument with the pupil. The lecturer cannot lay down his statements as the laws of the Medes and the Persians, because change in the world is continuous, and the lecturer, the professor, the teacher, is merely the intermediary between the subject matter and the pupil.

"Third, and very important, comes the matter of illustration, the driving home of important points by apt analogy, comparison, elaboration, detailed description, exemplification and contrast. Stories told occasionally in a lecture, provided they have a definite reason and purpose, will furnish the student with projecting hooks on which to hang memories of the facts in the lecture. The danger of derailing or sidetracking interest by stories which, of themselves, are more interesting than the subject matter of the lecture, however, is great, and illustrations used in a lecture, or in teaching a class, should be given the closest and most careful analysis and study before being applied.

Test for the Instructor

"WE ARE approaching the period wherein all professors will be trained to *teach.* It is not enough that the professors should be brilliant 'doers' in their subject, after the manner of the old masters of painting, who delivered no lectures, but painted continuously and allowed their students to copy their work, or even to paint in the details on the original works of art of the masters. Sending out a teacher who has had no training in teaching is like giving a boy a course in an art school and expecting him to paint a masterpiece immediately. Our mental scene-shifting today is too hurried. We rush from one subject to another in a hectic haste to get results in too brief a time. Lecturing to students is quite different from general public lecturing, primarily because the lecturer to students is not there to entertain them, but to retain their interest, and, at the same time, instruct them.

"The test of the lecturer, or expositor, then, is: Does he produce in the mind of the pupil the impression he desires to produce? Literary style is sometimes tested by the clearness with which it conveys the author's meaning. But sometimes the author may not desire that his meaning be understood. He may want his words to convey one meaning to one set of readers, and quite another meaning to another group. From this point of view, the test is: Does he convey the meaning to each that he intended to convey? Style is not so much a means of making another know what we think, as it is a means of producing a certain effect upon the mind of another. So, in the case of the lecturer, whether he be honest or dishonest, the result of successful lecturing must be that there now exists in the mind of the hearer a combination of mental elements that previously existed in the mind of the lecturer.

"This transmission of ideas can and should be taught to the lecturer or the professor before he mounts the platform or takes his seat in the professorial chair. It is not always the fault of the pupil that he does not understand the lectures he hears, or the lessons he is taught; quite as frequently it is the fault of the lecturer, who cannot put his mind in the place of the pupil's mind, or of the teacher who cannot realize that the student does not know as much as he, the teacher, knows of a certain subject. Surely, if our youth are to devote eight to twelve years to the laying of mental foundations for their lives, they are entitled to teachers who not only know the sort of structure they desire to erect on such a foundation, but how to build it after they have gathered the materials."

Has the Single Tax Theory Made Progress?

Denmark Declared to Be First Nation to Impose National Land Tax

By JOSEPH DANA MILLER

Editor's Note—Mr. Miller is editor of Single Tax Review and gives here a record of the present status of the Single Tax idea.

WHEN Henry George died in 1897 at the close of a dramatic campaign for mayor of Greater New York, it was felt by many that the progress of the cause to which he had given his life, and in the advocacy of which he was so impressive a personality, had suffered a serious interruption.

The years immediately succeeding must have seemed to justify such impression, for a period of inactivity followed, and the Single Tax ceased to be talked about as it had been in the lifetime of the author of *Progress and Poverty*. But the persistence of the agitation was nevertheless a fact, and its revival has kept it constantly if not prominently before large numbers of the people in almost every country.

What is the essence of that teaching? It is that the rent of land, or land value, belongs to the people and should be taken by the taxing power in lieu of all taxation on improvements and other products of labor. What progress has been made in the carrying out of this principle in legislation?

Perhaps no event in the direction of the Single Tax has been more notable than the new law enacted by Denmark on August 4, 1922, taxing land values at the rate of one and one-half mills on the dollar for national purposes. Heretofore there had been a real estate tax (that is, on land and buildings) of one and one-tenth mills. This tax is continued on improvements over ten thousand kroners. Thus the effect of the new law is to exempt improvements under the value named, while improvements in excess of that value will be taxed at a rate which is approximately only two-thirds of the rate levied on all land values, large or small.

We think we are right in saying that Denmark is the first country in the world to apply a national land tax, and with its exemption feature this act is therefore the nearest approach made by any nation as a whole toward the Single Tax. The government which has just passed this bill for national taxation has announced its intention to enact legislation for local purposes in which similar discrimination will be made between land values and improvements.

It has been thought that the farmers constituted the greatest bulwark of defense against any proposal for the taxation of land values. But it is to be noted that Denmark is a country of small farmers, and that the greatest organized force working for this reform was the band of 120,000 small cultivators who have been demanding this legislation in their conventions since 1902. For twenty years the resolutions passed at these conventions have been a bold embodiment of the Single Tax philosophy, and on this they have based their demands.

Turning now to our own country, there is today perhaps in every state in the Union, and certainly in the greater number of them, a larger proportion of land values taken for public purposes than at any time in our history.

Single Tax Teachings

LET us now take some of the states in which the more notable instances of progress may be indicated. Twenty years ago, during the administration of Mayor Low, real estate assessments in the city of New York were put on a full value basis and for the first time vacant lots were assessed for what they would bring, "as between a free buyer and a free seller." Later the department of taxes and assessments of the city had as its president the Hon. Lawson Purdy, and during his incumbency the tendency was to take an ever-increasing amount of land value through the strict and honest appraisal of the very valuable land of New York—the most valuable land in the world save London.

In September, 1920, confronted by the severe housing shortage, the lawmakers of Albany borrowed a leaf from the book of Single Tax and passed a permissive act by which new dwellings might be exempted from taxation for a period of ten years. New York City and six other cities of the state immediately availed themselves of the permission. Of course, there is little in common between the Single Taxer's proposal to take all the rent of land, or even as much of it as is needed for government expenses, and a measure which seeks to relieve the housing shortage by the exemption from taxation of new dwellings. Still Single Taxers were encouraged by the practical recognition of so much of their teachings, and were glad to welcome an illustration in the great city of New York of the stimulus afforded to one great industry by decreasing the tax burdens.

The effect of this exemption has been marked. The *Real Estate Record and Guide*, of New York, is authority for the statement that "More construction is now under way than ever before in the history of the city." Reports of the superintendents of the building bureaus show that on June 30, 1922, there were under construction in the city of New York 7,504 one-family houses, 6,366 two-family houses and 998 apartments to accommodate 23,791 families; a total of accommodations for about 40,000 families, capable of housing the entire population of a city the size of Atlanta or Omaha. These totals do not include dwellings built as a result of the stimulus of tax exemption and completed after assessment day, but before June 30.

The Pittsburgh half rate on improvements, which was inaugurated with a ten per cent exemption that has now reached thirty per cent and is to continue until a fifty per cent exemption is reached, is another notable experiment on Single Tax lines. The Pittsburgh Chamber of Commerce and the Allied Boards of Trade of that city have given it unqualified endorsement.

North Dakota in 1917 provided for the assessment of land at thirty per cent of its value, and improvements on farm land at five per cent of their value, which would result in such improvements paying only one-fifth of the tax paid by land of similar value. Cities were permitted to adopt a similar plan if they choose. In 1919, however, a new law was enacted, providing that land, railroads and other utilities and business buildings should be assessed at one hundred per cent of their actual value; buildings used for homes on city lots, live stock, personal property and farm machinery generally, to be assessed at fifty per cent of value, while farm buildings and improvements are exempted entirely.

Vancouver Not an Example

IN OTHER states there have been advances which have passed almost unnoticed by press or persons outside those states. Minnesota is a case in point. From 1881 to 1897 the valuable iron mines of that state paid nothing in taxes for local or state purposes. But in the latter year these lands were subjected to taxation by unanimous vote in the house and only four negative votes in the senate, despite the efforts of a powerful lobby. Since then they have paid several millions for schools, roads, township, village, county and city improvements. In 1921 the legislature passed another bill that will give to the state an additional four million dollars—all land value, no tax on capital or mining operations, but just the land value in the ore.

Mention should not be omitted of the method by which the maintenance and operation of the irrigation systems in California are paid for. The irrigation law of the state, as orginally adopted, provided for the taxation of both land and improvements. But in 1909 the law was amended limiting assessments in all new irrigation districts to land values only, and permitting the five irrigation districts then existing to adopt the new system by a majority vote of the resident land holders. Today more than 1,500,000 acres of California land located in the most fertile valleys and the richest section of the state, is operated under the Single Tax system. This is so extensive an application of the principle of land value taxation and exemption of improvements (the Single Tax) that it deserves more attention than has been given to it.

Crossing the border into Canada, we find that that country has made many important advances toward the Single Tax. In 1911 the city of Vancouver, British Columbia, abolished taxes on improvements. This was heralded far and wide as the Single Tax in operation. Of course, it was not. The low taxes on land values still permitted speculation in land, and the exemption of improvements caused a building boom which further increased land values. The war called for additional revenue, and the Vancouver council then resorted to the taxation of improvements, though a partial exemption still continued.

The Vancouver experiment has been pointed to as a failure of the Single Tax in practice. But this is a superficial view of what was done. The building boom that resulted from the exemption of buildings was, in fact, a demonstration of the stimulus given to industry by the removal of tax burdens. Had there been any real knowledge of the effects of this mode of taxation, or any disposition based upon such knowledge to make an adequate trial of the system, the result would have been different. As it was, it left us with no available data on which to base conclusions.

But happily Canada did not need such evidence. The city of Edmonton had already made somewhat halting advances toward the same system; Victoria has abolished all taxation of improvements; the smaller cities of the Alberta Province, Medicine Hat, Alberta and Lethbridge entirely exempt improvements and levy taxes for local purposes almost entirely on land values.

Municipalities in Manitoba obtain their revenues mainly from a tax on land values. In Winnipeg land is assessed at full value and improvements at two-thirds value. The cost of its water supply, more than $15,000,000, is made up by a special tax on land values.

In Alberta and Saskatchewan provinces the rural municipalities derive all revenues for local purposes from land values alone; the towns, cities and villages derive some revenue from improvements, but mainly from land values.

The principle of the Single Tax has been recognized in levying taxes for purely provincial purposes. Manitoba exempts farm stock and improvements; Saskatchewan levies an "unearned increment" tax; Alberta, in its first charter, provided for a general tax on land values to the exclusion of improvements, but modified by business and income taxes. These last have been abandoned, leaving the land tax to provide the necessary provincial revenues.

When the war came, and new sources of revenue seemed to be needed, there were instances of the return to the taxation of improvements. But these were not many nor important. And in no case was the full assessment of improvements restored. That system is dead in Canada. The whole course of her legislation is heading toward the complete liberation of industry, and Single Taxers of the Dominion believe that the goal to which they are traveling is almost within hailing.

Looking toward Australia for examples of Single Tax progress, we find Sydney, with a population of 800,000, and called "the New York of Australia," comes first in importance. This city wholly exempts improvements, nor is there any tax on personal property.

The movement in New Zealand received its early impetus from Sir George Gray, first governor of New Zealand, and one of the most remarkable men of the century. Sir George was deeply impressed on reading "Progress and Poverty," and he fathered legislation designed to prevent land speculation. Succeeding administrations repealed much of this. Graduated land taxes intended to break up the great estates were only partially effective, since "dummy holders" were easily substituted.

In its local taxation New Zealand has made the greatest strides toward the Single Tax. More than 167 local authorities "rate," as they say, on land values.

In Queensland since 1902 the policy of land value "rating" has been in full operation, in South Australia in thirteen municipalities for about ten years, and in the Transvaal in most localities since 1916.

The Argentine is one of the few countries where the Socialist leaders accept the Single Tax as the basic reform, the settlement of which is regarded as a prior condition to the development of any plans for a reorganized society.

Land Tax in the Argentine

IN THE province of Cordoba, in the Argentine, the bulk of the state revenue is collected from a land value tax. For many years the "real property tax" in Uruguay, outside of Montevideo and other municipalities, has been levied on land values exclusively. In Montevideo itself an admirable system of property valuation exists under which land values and improvement values are kept distinct. Under the late government a bill was brought in with official support exempting improvements entirely. The present president is credited with the intention to revive this proposal.

The state of Rio Grande do Sul, Brazil, claims to have been the first instance of the municipal Single Tax in operation in South America. Exemption of improvements exists in the city of Garibaldi, in that state.

The state government of Sao Paulo, Brazil, has initiated at the request of the Sao Paulo Agricultural Society, the study of the methods of assessment and taxation of land values in Uruguay, with a view of adopting measures necessary for the shifting of taxes from improvements to land values exclusively. The president of the state of Sao Paulo is a Single Taxer.

I have purposely made this article a record of achievement. The time when the entire rental value of land will be taken for public purposes is yet a long way ahead, but events are crowding one another and nearly every country in the world is making some favorable gesture toward the principle.

It should be noted that the new constitution of the German republic declares that "All the increase in land values not due to the expenditure of capital and labor must be used for communal benefits." This clause, going beyond a merely permissive declaration, is the first instance of such a statement in the organic law of any nation. No step has yet been taken to make this declaration operative.

The President Is Right

PRESIDENT COOLIDGE displayed wise statesmanship in refusing to state whether he would sign the Longworth compromise revenue bill, should the Senate pass a measure agreeing in its essentials with the one enacted by the House of Representatives.

There were many attempts to place the President on record on his future course on tax reduction. Some of the members of his own party were desirous of learning whether he would accept something short of the plan recommended by Secretary Mellon. Radical Republicans and Democrats would have liked Mr. Coolidge to have displayed a sign of weakness. But, in commenting on the action of the House, the President took occasion simply to reiterate his support of the tax reduction plan originally proposed by the Secretary of the Treasury, and declined to state his position regarding a purely hypothetical situation.

The President's stand will be approved as the proper one. It is the Constitutional duty of the Chief Executive to recommend legislation; it is also his duty to approve or disapprove of enactments of Congress. But it is no part of his duty to take part in the debate, the discussion, and the political maneuvering which accompany the process of getting a bill passed by the two Houses of Congress. And a flat statement, such as was sought of the President on the Longworth compromise, would obviously have been a part of the political maneuvering in connection with Congressional action.

Most legislation, when finally passed, is the result of compromise. Ideal measures must run the gauntlet of practical obstacles. The Mellon plan was proposed by the Secretary of the Treasury as one which would give a measure of tax reduction, encourage business and provide sufficient revenue to run the Government. The Garner plan was a proposal satisfactory to Democrat leaders who cling tenaciously to the surtax policy while the Frear proposals represented another point of view. For the President to have expressed hypothetical support or opposition to these plans while they were up in the House would have been unwise. It would have been just as improper to have expressed irrevocably opposition or support of the Longworth plan after its passage. And it would be unwise for him to take a stand, which commits himself finally, during the consideration of the problem by the Senate.

The time for the President to consider a measure other than the one he originally recommended is when that measure is before him after final passage. Then he will examine it from various viewpoints. He will decide first whether it provides sufficient revenue to run the Government. He will decide whether it affords real tax relief to the public. And he will decide whether lifting of the taxation burden has been made on sound or unsound theories. Then he will act.

True Mercy

IN TURNING loose from prison and restoring to American citizenship 100 men who deserted from the Army and the Navy after the termination of hostilities and before the formal declaration of peace, President Coolidge performed a humane and commendable act.

These men were punished as deserters. Technically, they left their posts of duty in war-time. Since the earliest times when man began to glorify war and courage, the flight from a post of duty in war-time has been deemed cowardice, and as such punished with the utmost severity.

The men whom the President freed belonged to this technical category. They deserted in war-time. In truth, of course, they were not cowards, because their flight came after the war had become a mere paper war. In releasing them and restoring them to citizenship, the Chief Executive recognizes that the war-time standards have ceased to govern.

Indeed, there is ground for strong argument that the President's clemency should go still further and be extended to those now in prison, who were sentenced for long periods for actual flight in battle. Fear, the highest authorities say, is an uncontrollable impulse, due to the state of mental and physical health which the individual possesses.

Courts-martial in war-time, on which sat some officers who never saw the Front and who knew nothing of battle conditions, imposed severe sentences on men who succumbed to hysterical fear and fled. Some of the men who were sentenced as cowards are said to have displayed a high degree of gallantry in previous fighting and to have finally fallen victim to a pathological condition over which they had no control. The release of such men from punishment at this time could not be harmful to the principle of military discipline in war-time. And it would be an act of Governmental mercy which would be generally applauded.

Just Noise, That's All

THE hubbub raised against the Johnson immigration bill is growing deafening.

In all parts of the country, mass meetings of protest, fostered by alien influences or selfish interests, have been held. During the past few weeks, the same old arguments that have been raised against further restriction of the alien horde have been reiterated.

Secretary Hughes, desirous of keeping the friendship of certain foreign peoples, issued a statement, pointing out certain provisions in the proposed law which he thought should be changed. His statement was taken by the advocates of unrestricted immigration as a text, around which they wove all sorts of arguments and demands for the killing of the entire immigration bill.

In the Senate, the Committee to which the immigration problem must go, has begun consideration of restriction based on quotas fixed under the 1910 census, as at present. The clamorous crowd which leads the movement for unrestricted immigration is inclined for the moment to favor the Senate Committee idea. But the favor is extended, confessedly, because Congress has shown a determination to tighten the safeguards against continued infiltration of the foreign elements which cannot and will not assimilate.

Certain portions of the press have taken up cudgels against the Johnson measure. Other newspapers, which will not openly oppose this measure, have given much space to the reporting of the meetings of protest. This policy has resulted in an appearance of great opposition to the selective immigration plan.

The truth is that this appearance is contrary to the fact. The opposition is noise and clamor, not substantial feeling. The great body of American people is by tradition, inheritance and training, a quiet one. It does not spend its time shouting its desires from the house-tops. It is inarticulate because it does not seek special favors. But the great mass of the American public possesses views and opinions, despite the fact that it does not hold mass meetings in which to express them.

Congress took action four years ago to limit immigration. That action was in response to an upheaval of real American sentiment. This limitation of immigration was admittedly a stop-gap, not permanent legislation. The American people expected that it would be followed by wise restrictive legislation, which would limit immigrants to this country to the kind of people who are willing and able to become Americans. Congress will do well to proceed calmly to the accomplishment of that purpose and not permit the volume of noise from alien elements to cloud the issue.

Knowing the Ropes

THE Governmental investigations at Washington disclose that a knowledge of the official ropes is a valuable asset to an individual seeking a fortune.

Certain Government officials, ranging from the Cabinet to humble clerks, have stepped from modest salaries to a degree of affluence, when they resigned their service of the people to take up the service of the private individuals or private corporations who are constantly seeking Government favors.

No absolute rule of condemnation can be laid down regarding the persons who have used their experience, knowledge and acquaintance, acquired in public employ, for subsequent private profit. Several Government departments wisely forbid their retired employes or officials from arguing private causes until a reasonable period after leaving office has passed. Obviously, however, this regulation is only relatively effective. Such employes may appear by partner or agent, and thus utilize their Government knowledge for private benefit.

The public cannot expect that it will retain indefinitely all its valued employes, when opportunity for greater remuneration presents itself in private employment. And it is clear that no man, retiring from the public service, can divorce his mind entirely of the knowledge obtained while in such service. Even the highest standards of ethics would not command that all persons, once in the public service, shall forever be disbarred from appearing in a professional or business capacity before Government departments.

The present turmoil over the dubious relationship between public officials, public business and retired public officials and quasi-public business will probably result in insistent demands for drastic regulation. It is doubtful whether any prohibitory legislation will be of much service in this regard, as the secret machinations which might ensue would be more harmful than the present situation. If a requirement of publicity regarding the identity of all persons and interests, requesting Government assistance or favor, could be enforced, it would better conditions measurably.

But the public's chief reliance must remain in the ethics of its officials. Just at present, the disclosures at Washington have provoked unjust cynicism over this question of ethics. The disclosures must be accepted as dealing with a temporary condition. The deep faith which American citizens entertain in their institutions cannot be uprooted by evidence that a few, a very few public officials, have been false to their trust.

Doesn't Mean Anything

FIFTY-EIGHT varieties of American statesmen have introduced into the House of Representatives identical bills providing for the modification of the Volstead Act to permit the sale of beer and wine.

There is little of note regarding the Representatives who thus succeeded momentarily in getting their names in the public prints. Aside from Representative Victor Berger, Socialist of Milwaukee, and Representative John Philip Hill, the perennial wet advocate of Maryland, most of the 58 are men of whom the nation at large had never heard before, and probably never will again. They are representatives from districts composed largely of alien stocks. New York City naturally had the largest quota.

None of the 58 bills has a chance to be passed by the present Congress. Each of the 58 national legislators knows this. Yet, each was eager to participate in the gesture of hatred to the Eighteenth Amendment. Their accomplishment will probably go down in history as the height of uselessness.

Naturally, those who profit from bond brokerage can see only danger in the cancellation of interest-bearing public bonds through the issue of legal tender, a non-interest-bearing obligation. There would be no dispute as to tax exemption if the public debt could be used as currency.

Every time usury is denounced, the attack is claimed to be on banks. In view of the many Bible texts against lending on usury, meaning interest, the question naturally arises as to how those who practice it can claim to be religious.

Legitimate banking is subject to the same injury from money monopoly as is every other business. Yet bankers fear attacks on money monopoly as leveled at legitimate banking. The honest banker has nothing to fear except money slavery to monopoly.

Bureaucratic Incompetence Hurting Germany

"Democracy of Peace" Has Failed to Aid Recovery of War-torn Nation

By SAMUEL CROWTHER

AN OFFICER of one of the large insurance companies said to me not long since:

"Why should not Germany be in good condition? She has no internal debt. That has been wiped out by the depreciation of the mark. So why all this fuss? Why is not Germany up and around and at work?"

The question was not one that I could answer within the limits of an ordinary conversation. It is not a question that can be fully answered by anyone. National and international questions are not open-and-shut affairs. And particularly is this the case with Germany.

Nobody in Europe is much interested in the truth. For instance, the reparations question does not concern Germany's ability to pay. The question is almost wholly one of human nature. The French and the Germans are probably least of all concerned with Germany's ability to pay. The French would like to have a continuing claim which they can use to prevent Germany from ever again becoming a military power. The Germans are concerned only with gaining assent to the smallest possible reparations. And it is rather difficult for a purely pro-American observer to pick out what he thinks is the truth. Our newspaper correspondents cannot cable the truth. They are compelled by force of circumstances to cable only the news. The news from Paris has to be pro-French; the news from Berlin has to be pro-German. One day we hear via Paris of the overflowing prosperity of Germany. The next day we hear via Berlin of harrowing destitution. And so it comes about that the ordinary newspaper reader, finding it wholly impossible to reconcile the various reports, gets himself into a state where he is ready to believe anything or nothing.

Work to Find Solution

WHAT brings us into quite a deal of our difficulty is centering the thought on Germany's ability to pay whatever indemnity may finally be decided upon as due under the Versailles Treaty. It will be recalled that the original indemnities were settled upon without regard to their payment. An election was coming on in England and Lloyd George promised the voters that Germany would pay all the costs of the war. Clemenceau said about the same thing to the French people. And the indemnity payments were arrived at purely for the benefit of the folks at home. Since then the payments have been scaled down and down. The English have wanted to have a sum agreed on and the thing over with. The French have been mainly concerned in rendering Germany impotent. Now, an unofficial committee, consisting of three exceedingly able Americans —General Dawes, Owen D. Young, and Henry P. Robinson—are working night and day to find some solution which will make out of Germany a productive unit in the world's economy. No settlement can be satisfactory, but if the American committee succeeds in reaching a series of conclusions, which both the French and the Germans will denounce as outrageous, then we can take for granted that their conclusions will come close to the truth. For nothing is more objectionable to either France or Germany than the truth. That is the background.

I traveled rather thoroughly from one end of Germany to the other in the early part of 1919—that is, just a couple of months after the Armistice. My recent trip took me all over Germany, and I had an opportunity to see what had been accomplished in four years. I find Germany today in most respects worse off than immediately after the end of the war. After the war came uncertainty, but with it was hope. Now there is uncertainty, but it is accompanied by despair. Or, to put it another way, Germany was then a factory in the hands of a receiver but which the workmen expected would soon open up again. Now it is a factory which failed and opened only to fail again. For the cruelest portion of this whole thing, as far as the plain citizen in Germany is concerned, is that after the deprivations of the war and the wearing period of the early peace he found himself in a period of a kind of prosperity induced by the inflation of the currency only at last to come to nothing whatsoever.

When Value of Mark Went

THE before-the-war German was thrifty. It was a rare thing to find a family without a nest egg. Now every savings account, every bond, and every mortgage has been wiped out. The returns from rented property are so insignificant that practically everyone lives rent free. For instance, in Dresden I met a very respectable, well-educated young man hawking chocolate bars. He told me that before the war he and his old mother received twenty thousand marks a year from rentals of property. That meant five thousand dollars, which was quite a respectable income. Certain increases in rentals had been permitted, so, at the time he talked with me, they were getting two hundred thousand marks a year from their property—which was exactly the price of a single bar of the chocolate he was selling!

Perhaps in the long scheme of things the wiping out of the internal indebtedness of a nation is not an affair of much consequence. It is just a bookkeeping game in which the debtor wins and the creditor loses. The actual productive wealth remains the same as it was before. But it does make a tremendous difference in the morale of the people; for here we find a man, a debtor, who is getting something for nothing by having currency depreciation practically destroy his indebtedness; and here we find a man, a creditor, who has just had that which he has worked through the years for taken away from him. Neither is in the mood for work.

The big asset of old Germany was skilled, willing labor. That asset has gone. Many of the older workers were killed in the war. Those who survived cannot adapt themselves to circumstances in which neither thrift nor industry counts. The younger workmen of Germany are not skilled. They were in the army when ordinarily they would have been serving their apprenticeships. The youngsters who would be apprentices today, if there were anything for them to do, passed their formative years during the war and immediately thereafter, when food was scarce and dear. The German youth of today can hardly remember a time when he had enough to eat. The whole working population, which ate so heartily before the war, has not eaten for a long time. It is today undernourished.

At the close of the war the German workman was not undernourished. There was great talk of "lebensmittel" in Hamburg, Berlin, Breslau, Leipzig, and Dresden, and conditions undoubtedly were bad in most of these cities and especially in Hamburg. But I did not find the workmen of the Ruhr looking underfed. Neither were they underfed in Silesia or in Saxony or in the industrial plants I visited along the Rhine. The government had been able to get food to them that they might carry on for the war. But a few months ago things were very different. Never have I seen a waner, paler, more dragging lot of men than filed out of Krupp's, at Essen, one noon hour.

Everywhere in Germany, except on the farms, food is scarce. It is scarce because Germany has never been able to raise enough food for her population. She has always had to export goods to buy food. She has not been able to export. But I found food scarcer than it really ought to be because of the tangled mass of red tape which today goes by the name of a government in Germany. Everything is regulated. A housewife spends at least five hours out of every day standing in line to buy the necessities of life at some government-regulated shop. We used to joke about the "verboten" signs of imperial Germany, but the imperial officers were mere amateurs in the "verboten" business compared with the republican officers of today.

The only industry which has really thrived in Germany since the revolution of 1918 has been the government industry of creating bureaus and officers. The railroads and the public offices are so loaded with men that they could not work if they wanted to. It is quite impossible to get at the figures, but I believe the civil list of Germany today is more of an expense than the army used to be. Certainly it is more of a nuisance and even if industry were thriving in Germany—which it is not—it could not begin to make goods enough to feed the mouths of the non-producers.

Has Suffered Acutely

THE indemnities question is a considerable one, because of what might be called its moral ramifications. But the main question in Germany today is not indemnities. Nor is Germany recovering from the war. The principal recovery will have to be from the democracy of the peace!

For Germany, like most of the countries of Europe, has acutely suffered from the Socialist wave which starts out to give a living to everyone without work and ends up by creating a mass of useless officials who prevent work and expect to be supported for doing so.

The Germans are not accustomed to self-government; under the kaiser they had the forms of self-government, but most matters of importance were decided from above. In the critical period since the war, a firm and skilled government has been needed, for the country had lost both men and wealth. The big thing was to repair the losses. In addition was the indemnity; any indemnity to be paid will be a burden on production. The money will have to be paid out of production in the future. Wealth in such vast quantities does not exist ready at hand in movable form, so the task was to devise a productive scheme which would both repair the losses of the war and pay on the indemnity and at the same time give to the people a respectable living. No country has ever been called on to make such a struggle in peace. It was a time for government economy and for industrial efficiency. The way was made all the harder because the most lucrative markets of Germany in the past had been suspended during the years of the war and many of them had after the Armistice erected special customs barriers against German goods. Cheap, well-made goods will, however, overcome any customs barrier. Citizens of no country will pay more for home goods than they will for foreign goods; that has been proved over and over again. The slogan "Buy home products" was invented by sellers and not by buyers.

What happened? The Revolution broke down the machinery of the imperial government. The new government started an immense program of reforms. It gave doles to the unemployed and it paid billions of marks to the owners of property in Alsace and Lorraine which had been lost under the Treaty. It made the eight-hour day compulsory, in spite of the fact that the plant and equipment of the country were in bad condition after the strain of war. Hours and wages are the results of production; to cut hours and to increase wages without keeping up production is to assume that wages come from nowhere—that there is an Aladdin and a lamp to bring them into being.

The government kept all its war controls and sold food at less than it bought it for. The mark still had a considerable value—in the early part of 1919 we valued it at roughly ten cents. The outside world, and especially America, thought that the mark would recover and bought marks for speculation.

All Expenses Increased

THE government increased every item of expense and it had almost no revenue because it had no production to draw upon. Therefore it began to print marks in fairly large quantities. The printing of money that has no backing at all can go on for a considerable period, because people through long usage become accustomed to taking a paper bill at what it purports to be. What we call inflating the currency is a system of taxation. The volume of money to a large degree determines prices. If one hundred million marks are out and the government prints another hundred million without value, prices in marks will gradually be doubled and the government will have taken to itself half of the value of the outstanding currency. This process can keep on until the people become afraid of the money and dispose of it as quickly as possible after it reaches their hands—workmen began to ask to be paid in the morning instead of in the afternoon. It is then that prices rise by the hour and money becomes scarce; the mark depreciated slowly for a while and only last year did it take the plunge.

Ever since the Revolution the government has been paying its expenses by printing marks instead of by stimulating production. No single man has been strong enough to come forward with a plan in which work and thrift would be supreme; no party has been strong enough to stem the tide. For if the government withdrew its doles and cut down its staffs, another revolution would surely have taken place and probably it would have been a Bolshevik revolution of desperation.

Just what all this means—how it has thrown Germany into the hands of a few men, how it has impoverished the worker and so cut down the productive power of the country that it will be many years recovering—will be outlined in the next installment.

Lumberjack Poet of the Pines Once Salesman

Concluded from page 5

carries. In his hands were two pails overflowing with blueberries. He had been out since early morning.

"Such a day will net me fifteen dollars, and that will help to pay some of the doctor's bills," explained the woodsman poet.

"I came to talk with you about your poems," explained Mr. Zimmerman. A light suffused the face of Hayward. For twenty years he had been striving for recognition. At last his rugged verse, written from his wilderness retreat, had attracted attention. A stranger had found him in the remote wilderness.

For more than an hour Mr. Zimmerman listened to more poems, simple and sincere, quaint and fanciful in rhyme, but as throbbing with love and sentiment as the near-by woodlands were pungent with the odor of pine-scented, budding, blooming fields. The bookmaker came seeking the author, and the publication of "Poems from the North Woods" was the result of his visit.

The hair of the lumberjack poet is turning gray. But his face is pleasant and the tone of his voice is resonant and musical, with the deeper harmonies of a settled, peaceful, restful world of seclusion.

Twilight was stealing across the snow-shrouded countryside. An uncompleted verse lay on the table. He arose from his talk, stirred the dying embers on the hearth. The glow lighted up the room. Now he appeared different. He was strong and muscular, garbed in a large, checked flannel shirt and heavy wool trousers, a necessity in this rugged climate. The wife with whom he had planned and worked, whom he loved and cared for for more than a quarter of a century was now missing from the log cabin home. A touch of sadness deepened the lines in his kindly, pleasant face, like the shifting of another scene. He was lonely.

"I sometimes feel that I should also be preparing for the long lonesome trip—we have always been together," he almost whispered. A second later, a more ennobling thought animated his face, lighting his eyes, robbing his countenance of all sentiment of fear and compassion.

"I guess that poem I wrote about 'The Summons' will best express what I wanted to tell you," he remarked, as we parted. I found it in the little green-covered book of poems, illustrated with log-cabin scenes and pictures of lakes and north woods, which I carried away under my arm.

THE SUMMONS

"I'll stand bravely in line while the numbers are called,
When at last I hear mine, I will not be appalled;
But respond to the voice calling softly and low,
Which would give me no choice, if I wished to say no;
Tho' I'd linger awhile midst the pleasures down here,
With a tear and a smile, I will go without fear;
I've been taught from my youth that this summons must
  come,
Then I'll know as a truth, it is calling me home—
Where another career with others I'll share,
Leaving earth friends down here, for the ones over
  there."

Why Don't Women Investigate Propaganda?

Vigorous House-cleaning to Prevent Further Duping of Organizations

By An American Citizen

IN SAMUEL SOLOMEN'S book, "The Red Destruction of the Family," are hundreds of quotations from Socialist and Communist authorities proving that those who adhere to its principles are bent upon the destruction of the family, and of morality as we now interpret that term. Most of the women working for disarmament and allied radical plans are unaware, and indeed deny that the facts set forth in Solomen's book are true, but listen to the advice given in the Washington conference and it will be clear how well the Pacifist-Radical understands the necessity for camouflage: *"We want also to look like patriots in everything we do. We want to get a lot of good flags, talk a good deal about the Constitution and what our forefathers wanted to make of this country, and show that we are the folks that really stand for the spirit of our institutions."* (It is to be regretted that a full report of this convention cannot be given in this article.)

The reappointment of Lucia Ames Mead as chairman of the committee on Permanent Peace in the National Council of Women came as a surprise to the majority of council delegates. Even those who previously voted for her appointment thought it wiser to have someone less radical, but just as the matter was up for discussion before the board, Mrs. Mead herself appeared and the discussion ended. We must remember that most of the board are personal friends of Mrs. Mead's and were embarrassed by her presence. Thus was Mrs. Mead's appointment referred to the executive committee where she was sure of her majority vote.

The episode calls attention to a condition that probably could not exist outside a woman's organization. Until it is made unconstitutional in the council for officers and chairmen to be present when they are being discussed as candidates it becomes comparatively easy to control appointments.

The reappointment was given Mrs. Mead conditioned upon her assurance that she would not use the same propaganda methods in the future that she had in the past.

Mrs. Lucia Ames Mead introduced a resolution that provided that the National Council of Women should affiliate with the National Council for Disarmament. At the board meeting of the National Council at Des Moines last year Mrs. Mead endeavored to get the National Council of Women to pass a similar resolution. The chief opponents of this proposal were Mrs. Thomas G. Winter, president of the General Federation of Women's Clubs and Mrs. Flo Jamison Miller, corresponding secretary of the Council.

Declared a Menace

WHEN Mrs. Winter was associated with the Disarmament Conference she became aware of the danger inherent in pacifist organizations, and at the Des Moines meeting, among other things, said, "I believe Frederick J. Libbey and his organization, The International League for Peace and Freedom, are a national menace." Mrs. John Sherman represented Mrs. Winter at the Decatur convention. Mrs. Sherman voted against any affiliation with the Disarmament Council.

At one time most of the affiliated organizations in the National Council for Women were members of the Women's International League for Peace and Freedom. Recent revelations in regard to the latter's radical background caused the resignation of many of the members, including Mrs. Philip North Moore, president of the National Council of Women.

The "freedom" accorded the minds of the women whose membership sustains these organizations may be measured by the following: It is usual for the chairmen of committees to indicate their endorsement of those invited to speak before the Council on subjects falling within the range of their committee work. Thus, no woman is allowed to speak on the subject of Peace or Preparedness, unless she is certain to say those things which the International League for Peace and Freedom endorses. At the board meeting in Washington in May of this year, Mrs. Lucia Ames Mead and Mrs. Louis Post introduced Madam Solomon, of Germany, a vice-president of the International Council of Women, who spoke twice. She released a flood of misinformation about conditions in Germany, but no one refuted her statements. The conclusions of the delegates formed by what they hear at these council meetings extend through the great network of affiliated organizations, reaching into every village of every state of the Union.

Illustrating this delightful combination of "freedom" with misinformation is the experience of Mrs. Haviland H. Lund whose popularity with the leaders received a sudden chill, and from a very strange cause. Mrs. Lund was one of the first to uncover the radical and revolutionary nature of the Pacifist and Welfare legislation so generally endorsed by our women. She has long urged the establishment of "The Institute of Government," an agency for the distribution of facts, which she designed should utilize the machinery of existing organizations rather than create new machinery. Mrs. Lund distrusted the already over-organized state of women's work. She has held tenaciously to the opinion that most of the women guilty of spreading subversive propaganda are deceived. Mrs. Lund thinks it possible to enlighten the membership of propaganda organizations and thereafter to use many of their own leaders to spread truth. Her method has been to place documented evidence in the hands of existing leaders that they may be made potent in their own sphere of activity. To ascertain the facts, Mrs. Lund assembled a faculty of specialists in Political Science, Sociology and related fields.

In 1921, the president of the council, Mrs. Moore, had no trouble in arranging for Mrs. Lund to address the Council. The radical leaders were not at that time aware of Mrs. Lund's attitude toward radical propaganda through women's organizations. A committee was appointed to examine the details of the plan. Mrs. Moore at that time so little suspected the inroads of political propaganda from the radical organizations affiliated with the council that she appointed Professor Marion Whitney as chairman of this investigating committee, because she is chairman of education in the council. Miss Whitney is an ardent pacifist, an active member of the League of Women Voters, and a teacher at Vassar College. (The Rand School of Social Science recommends Vassar and Bryn Mawr as being "liberal" girls' colleges.) There "happened" to be a majority of League of Women Voters on this investigation committee and Mrs. Lund's program, needless to say, was not endorsed. At this meeting, Miss Whitney made the statement that the "League of Women Voters was to be the political expression of the National Council of Women."

The methods used by the Pacifist-Radical group to keep their control of the Council, as evidenced by instances like that which has just been related, is a long story, but it is sufficient to say here that when a woman attains a degree of influence and also shrewdly sees through the camouflage thrown over radical activities, she is not longer wanted. Such a woman is labeled "dangerous" and indeed she is dangerous, for she has surprised the secret and will not keep it. Then begins every trick of opposition from petty pin-pricks to character assassination. But of all this, the millions of women in "clubs" throughout the country, are not informed.

The International Council of Women is to hold its quintennial convention in Washington in May, 1925. According to Mrs. Lucia Ames Mead and Mrs. Maud Wood Park, this is to be a "No More War" meeting. All American women want the world free from the criminal idiocy we call war, but how many of them know that the nations that are secretly doing most in the way of military preparation are backing the Pacifist program of American women's organizations?

Women leaders who are shrewd enough to "spot" the influences which have captured the machinery are saying: "We must see to it that our pacifist women in the council get the facts before the 1925 meeting. If we work patiently, they will soon see that they have been fooled in the name of peace to work for that which will inevitably bring war."

The turmoil among the women at the Decatur convention was caused by an innocent resolution which could hardly have been opposed save by those who had somewhat to fear from its enactment. Here is the resolution, drawn by Mrs. Haviland H. Lund at the request of what may be called "the wideawakes" among the women there assembled:

WHEREAS the Attorney-General of the United States in his annual report states that there are 427 propaganda organizations in our country spending millions monthly to mislead our people and since several patriotic organizations affirm that the churches and women's organizations are the special prey of these propagandists and also affirm that consciously or unconsciously said churches and organizations are influenced in their legislative programs thereby and are assisting Socialism to bring about their "Bloodless Revolution" in the name of Pacifism and Child Welfare,

BE IT RESOLVED, that the National Council of Women appoint a committee to be composed of one member from each of our affiliated organizations to investigate the subject of propaganda in all of its phases and to report to the next board meeting."

Mrs. Lund's Arguments

THE only speaker on the peace program was Professor James W. Garner, of the University of Illinois, on "International Co-operation and American Politics." This address was by no means what Mrs. Mead anticipated, and her face reflected her amazement and consternation. Professor Garner, it seems, has spent long and frequent periods in France, hence, he defended the occupation of the Ruhr, said that France is not militaristic, explained why France must remain in the Ruhr, and disclaimed against the illusion of disarmament at this time. Professor Garner stated that we can fight with a fifty per cent reduction in armament and though he is an ardent advocate of the League of Nations, he certainly advocated a peace program that effectually demolished the Pacifist technique. Professor Garner left soon after he finished his speech and Mrs. Mead then revealed the adroitness of her leadership. The clever way in which she juggled Professor Garner's words and made them appear to mean that which she wanted them to mean was masterly. She talked on and on and on. It was evident that she meant to leave no time for discussion.

When it was nearly six o'clock, Mrs. H. H. McClure, of Kansas City, the newly elected president of the National War Mothers, finally interrupted Mrs. Mead and asked that Mrs. Lund be heard. Five minutes' time was granted and Mrs. Lund said in part:

"Probably no one will contradict the statement that we are farther from peace today than we were at the close of war. In whatever direction we look we are confronted with lack of confidence in the printed word and in existing political leadership throughout the world. Every political writer returning from Europe warns us that our country is flooded with propaganda. Every political writer in our own country knows that this is true. It is evident that propaganda does not make for peace . . . .

"Those who have made a survey of propaganda announce that it is the special aim of the propagandist to deceive our churches and women's organizations, hence we must be on the alert to sift all statements and get to the basic truth . . . .

"The propaganda against chemical warfare and aircraft development has been let loose upon us in a flood by those who themselves are concentrating upon its development. This statement is susceptible of proof. I implore this great organization of women to take time to understand propaganda. It touches every phase of our work, and especially does it need to be understood in relation to Peace . . . .

"I wish there were time to tell you the story of the propaganda against the air service during the Great War. Never in any dime novel has there been set forth such a story of intrigue, treachery and deception as the unprinted aircraft story reveals . . . .

"We can arrive at the truth about these things only by taking time for an exhaustive study of the subject of propaganda. I shall, during this session, introduce a resolution asking that this organization appoint one member from each of its constituents' organizations to make such a survey and report at the next board meeting."

Mrs. Mead: "I am sure the National Council of Women will not agree that it is necessary to establish a detective agency."

Mrs. Lund: "Madam Chairman, you misunderstand. I had no such thought in mind. The word "detective" should not, however, be offensive in relation to a search for truth. To *detect* truth should be an honorable undertaking; however, it is so well known that the Pacifist organizations do not keep books and that there are no files indicating the contributions they receive, that none of us who are enlightened upon these matters think of trying to trace money, nor do we wish to do the type of detective work Mrs. Mead specifies. On the contrary the program I have in mind for this committee is that it shall examine the historic background of propaganda and shall read something like a dozen books, some of which are not on sale through the bookstores and shall examine many documents as yet unpublished to the end that *they may know how to detect propaganda."*

Inquiry Committee Named

NEXT day Mrs. Belle W. Bliss, president of the Women's Relief Corps, introduced the resolution drawn by Mrs. Lund, and every vote in the Relief Corps was behind it. Mrs. Bliss asked the chair to permit Mrs. Lund to speak for her resolution and Mrs. Lund said:

"I am very reluctant to attempt to explain anything pertaining to propaganda in a ten-minute speech. It takes about twenty-six consecutive hours to tell all that is known about it, but when our Attorney-General states that there are four hundred and twenty-seven organizations spending millions monthly, it is obvious that all of us are bound to be more or less deceived.

"Not all of these propaganda organizations are engaged in what is known as subversive propaganda. We have the British, and the French, the Italian, the Japanese, and so on. In other words, we are besieged by special pleaders on all sides. We need to know all the facts behind this special pleading, but more than anything else we need to understand the network of *subversive* propaganda as it operates through our schools, colleges, churches and women's organizations. We cannot hope to understand this without taking time to go into it deeply. It is a big and complex subject.

"If the most astute brains of the world are employed to deceive us and there is no end of money at their disposal, no one need feel humiliated by the discovery that he too has been deceived. Those instigating plans for the destruction of our government realize that they can succeed only by deceiving us. They know they must accomplish their end by appealing to our holiest impulses. No one could look into the faces of the women here assembled, every one of whom is consecrated in her work to uplift the race, and not know that such women must be first persuaded that what they do is for the highest purpose. Yet it is a fact that the Socialists boast that they will achieve through the ballot or what they call the "Bloodless Revolution," the establishment of a great bureaucracy in the United States in the name of Peace and Child Welfare. To understand this we have got to go to the very bottom of the subject.

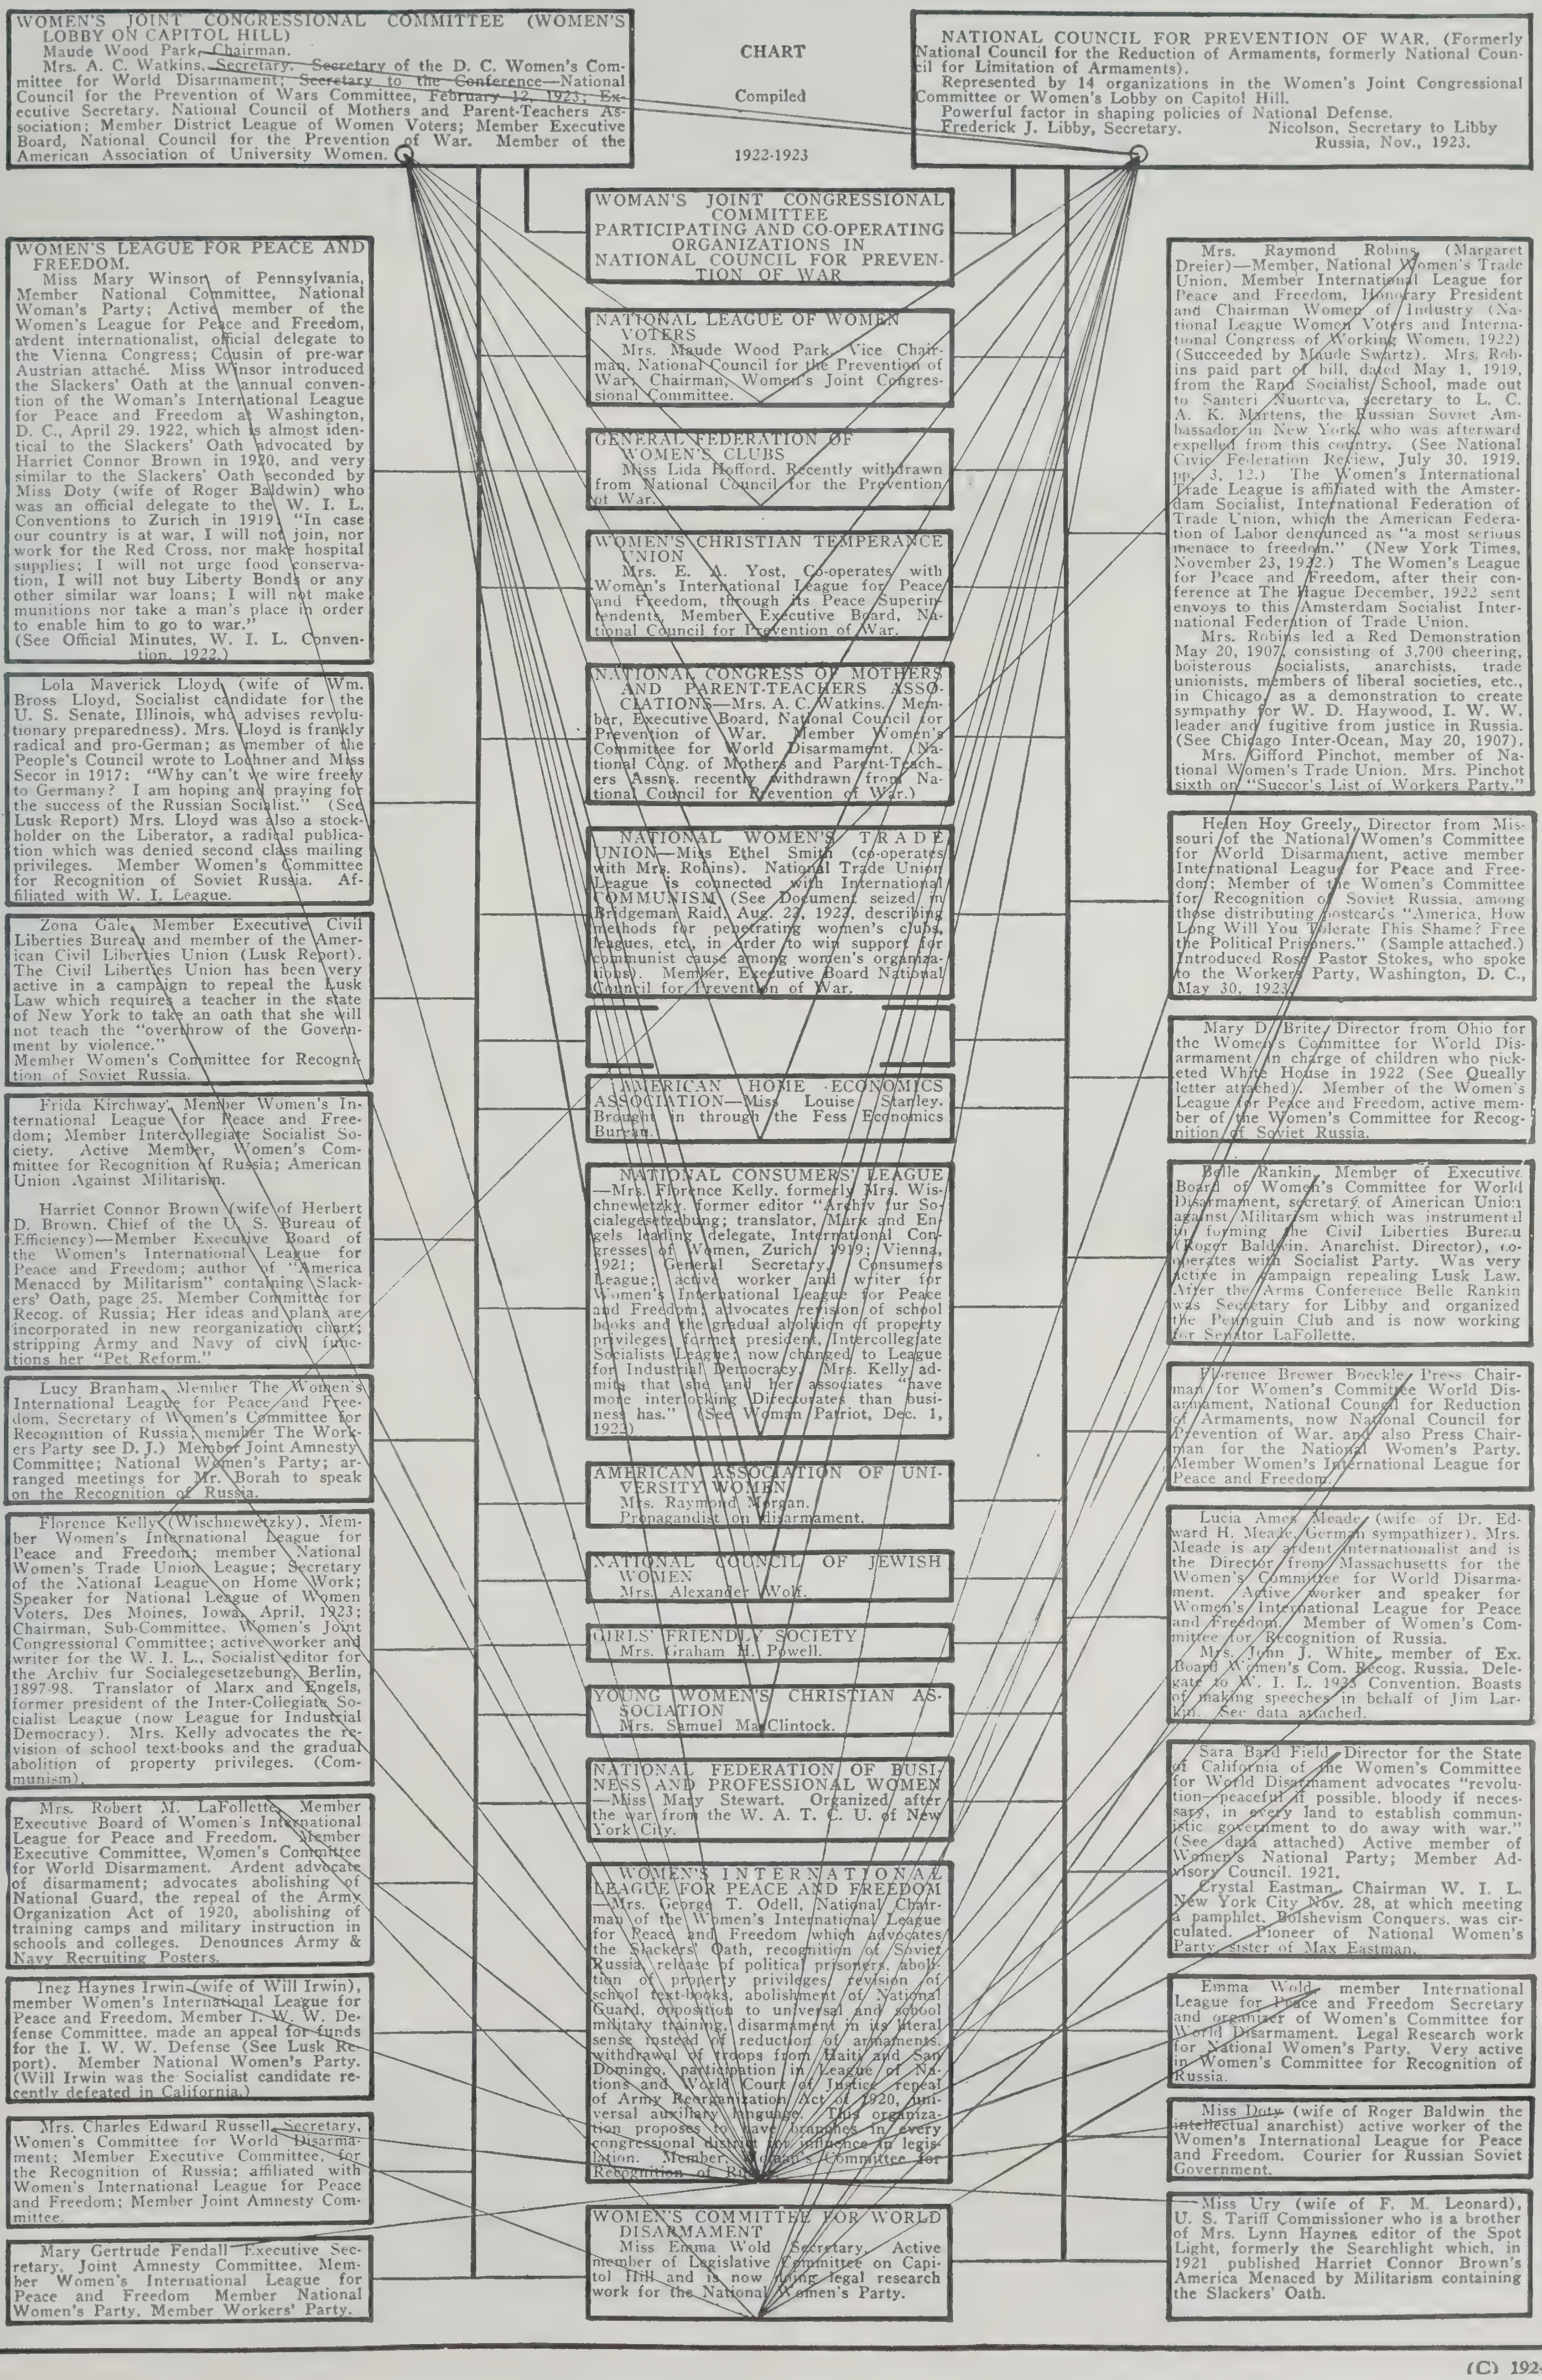
"I understand that a story obviously calculated to be derogatory has been circulated that I am paid by some commercial organization to come here and influence you. I wish that this were true. I believe that my work is important enough to the nation and to many commercial organizations to warrant my being paid for coming and if this were true, I would very proudly admit it, but it isn't. . . .

"You will find propaganda has its hooks in our drama, our music and our art, as well as in the motion picture . . . .

"To deceive such women as are here assembled Satan must indeed manifest himself as an "Angel of Light."

(Concluded on page 13)

The Socialist-Pacifist Movement in America Is an Absolutely Fundamental and Integral Part of International Socialism (Lusk Report Page 11.)



CHART

Compiled

1922-1923

WOMEN'S JOINT CONGRESSIONAL COMMITTEE (WOMEN'S LOBBY ON CAPITOL HILL)
Maude Wood Park, Chairman.
Mrs. A. C. Watkins, Secretary. Secretary of the D. C. Women's Committee for World Disarmament; Secretary to the Conference—National Council for the Prevention of Wars Committee, February 12, 1923; Executive Secretary. National Council of Mothers and Parent-Teachers Association; Member District League of Women Voters; Member Executive Board, National Council for the Prevention of War. Member of the American Association of University Women.

NATIONAL COUNCIL FOR PREVENTION OF WAR. (Formerly National Council for the Reduction of Armaments, formerly National Council for Limitation of Armaments).
Represented by 14 organizations in the Women's Joint Congressional Committee or Women's Lobby on Capitol Hill.
Powerful factor in shaping policies of National Defense.
Frederick J. Libby, Secretary. Nicolson, Secretary to Libby Russia, Nov., 1923.

WOMEN'S LEAGUE FOR PEACE AND FREEDOM.
Miss Mary Winsor of Pennsylvania, Member National Committee, National Woman's Party; Active member of the Women's League for Peace and Freedom, ardent internationalist, official delegate to the Vienna Congress; Cousin of pre-war Austrian attaché. Miss Winsor introduced the Slackers' Oath at the annual convention of the Woman's International League for Peace and Freedom at Washington, D. C., April 29. 1922, which is almost identical to the Slackers' Oath advocated by Harriet Connor Brown in 1920, and very similar to the Slackers' Oath seconded by Miss Doty (wife of Roger Baldwin) who was an official delegate to the W. I. L. Conventions to Zurich in 1919. "In case our country is at war, I will not join, nor work for the Red Cross, nor make hospital supplies; I will not urge food conservation, I will not buy Liberty Bonds or any other similar war loans; I will not make munitions nor take a man's place in order to enable him to go to war."
(See Official Minutes, W. I. L. Convention, 1922.)

Lola Maverick Lloyd (wife of Wm. Bross Lloyd, Socialist candidate for the U. S. Senate, Illinois, who advises revolutionary preparedness). Mrs. Lloyd is frankly radical and pro-German; as member of the People's Council wrote to Lochner and Miss Secor in 1917: "Why can't we wire freely to Germany? I am hoping and praying for the success of the Russian Socialist." (See Lusk Report) Mrs. Lloyd was also a stockholder on the Liberator, a radical publication which was denied second class mailing privileges. Member Women's Committee for Recognition of Soviet Russia. Affiliated with W. I. League.

Zona Gale, Member Executive Civil Liberties Bureau and member of the American Civil Liberties Union (Lusk Report). The Civil Liberties Union has been very active in a campaign to repeal the Lusk Law which requires a teacher in the state of New York to take an oath that she will not teach the "overthrow of the Government by violence."
Member Women's Committee for Recognition of Soviet Russia.

Frida Kirchway, Member Women's International League for Peace and Freedom; Member Intercollegiate Socialist Society. Active Member, Women's Committee for Recognition of Russia; American Union Against Militarism.

Harriet Connor Brown (wife of Herbert D. Brown. Chief of the U. S. Bureau of Efficiency)—Member Executive Board of the Women's International League for Peace and Freedom; author of "America Menaced by Militarism" containing Slackers' Oath, page 25. Member Committee for Recog. of Russia; Her ideas and plans are incorporated in new reorganization chart; stripping Army and Navy of civil functions her "Pet Reform."

Lucy Branham, Member The Women's International League for Peace and Freedom, Secretary of Women's Committee for Recognition of Russia; member The Workers Party see D. J.) Member Joint Amnesty Committee; National Women's Party; arranged meetings for Mr. Borah to speak on the Recognition of Russia.

Florence Kelly (Wischnewetzky), Member Women's International League for Peace and Freedom; member National Women's Trade Union League; Secretary of the National League on Home Work; Speaker for National League of Women Voters, Des Moines, Iowa, April, 1923; Chairman, Sub-Committee, Women's Joint Congressional Committee; active worker and writer for the W. I. L., Socialist editor for the Archiv fur Socialegesetzebung, Berlin, 1897-98. Translator of Marx and Engels, former president of the Inter-Collegiate Socialist League (now League for Industrial Democracy). Mrs. Kelly advocates the revision of school text-books and the gradual abolition of property privileges. (Communism).

Mrs. Robert M. LaFollette, Member Executive Board of Women's International League for Peace and Freedom. Member Executive Committee, Women's Committee for World Disarmament. Ardent advocate of disarmament; advocates abolishing of National Guard, the repeal of the Army Organization Act of 1920, abolishing of training camps and military instruction in schools and colleges. Denounces Army & Navy Recruiting Posters.

Inez Haynes Irwin (wife of Will Irwin), member Women's International League for Peace and Freedom, Member I. W. W. Defense Committee. made an appeal for funds for the I. W. W. Defense (See Lusk Report). Member National Women's Party. (Will Irwin was the Socialist candidate recently defeated in California.)

Mrs. Charles Edward Russell, Secretary, Women's Committee for World Disarmament; Member Executive Committee, for the Recognition of Russia; affiliated with Women's International League for Peace and Freedom; Member Joint Amnesty Committee.

Mary Gertrude Fendall Executive Secretary, Joint Amnesty Committee. Member Women's International League for Peace and Freedom Member National Women's Party, Member Workers' Party.

WOMAN'S JOINT CONGRESSIONAL COMMITTEE PARTICIPATING AND CO-OPERATING ORGANIZATIONS IN NATIONAL COUNCIL FOR PREVENTION OF WAR

NATIONAL LEAGUE OF WOMEN VOTERS
Mrs. Maude Wood Park, Vice Chairman, National Council for the Prevention of War; Chairman, Women's Joint Congressional Committee.

GENERAL FEDERATION OF WOMEN'S CLUBS
Miss Lida Hofford. Recently withdrawn from National Council for the Prevention of War.

WOMEN'S CHRISTIAN TEMPERANCE UNION
Mrs. E. A. Yost, Co-operates with Women's International League for Peace and Freedom, through its Peace Superintendents, Member Executive Board, National Council for Prevention of War.

NATIONAL CONGRESS OF MOTHERS AND PARENT-TEACHERS ASSOCIATIONS—Mrs. A. C. Watkins. Member, Executive Board, National Council for Prevention of War. Member Women's Committee for World Disarmament. (National Cong. of Mothers and Parent-Teachers Assns. recently withdrawn from National Council for Prevention of War.)

NATIONAL WOMEN'S TRADE UNION—Miss Ethel Smith (co-operates with Mrs. Robins). National Trade Union League is connected with International COMMUNISM (See Document seized in Bridgeman Raid, Aug. 22, 1922, describing methods for penetrating women's clubs, leagues, etc., in order to win support for communist cause among women's organizations). Member, Executive Board National Council for Prevention of War.

AMERICAN HOME ECONOMICS ASSOCIATION—Miss Louise Stanley. Brought in through the Fess Economics Bureau.

NATIONAL CONSUMERS' LEAGUE—Mrs. Florence Kelly. formerly Mrs. Wischnewetzky. former editor "Archiv fur Socialegesetzebung; translator, Marx and Engels leading delegate, International Congresses of Women, Zurich 1919; Vienna, 1921; General Secretary, Consumers League; active worker and writer for Women's International League for Peace and Freedom; advocates revision of school books and the gradual abolition of property privileges; former president, Intercollegiate Socialists League; now changed to League for Industrial Democracy. Mrs. Kelly admits that she and her associates "have more interlocking Directorates than business has." (See Woman Patriot, Dec. 1, 1922)

AMERICAN ASSOCIATION OF UNIVERSITY WOMEN
Mrs. Raymond Morgan.
Propagandist on disarmament.

NATIONAL COUNCIL OF JEWISH WOMEN
Mrs. Alexander Wolf.

GIRLS' FRIENDLY SOCIETY
Mrs. Graham H. Powell.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION
Mrs. Samuel MacClintock.

NATIONAL FEDERATION OF BUSINESS AND PROFESSIONAL WOMEN—Miss Mary Stewart. Organized after the war from the W. A. T. C. U. of New York City.

WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM—Mrs. George T. Odell, National Chairman of the Women's International League for Peace and Freedom which advocates the Slackers' Oath, recognition of Soviet Russia, release of political prisoners, abolition of property privileges, revision of school text-books, abolishment of National Guard, opposition to universal and school military training, disarmament in its literal sense instead of reduction of armaments, withdrawal of troops from Haiti and San Domingo, participation in League of Nations and World Court of Justice repeal of Army Reorganization Act of 1920, universal auxiliary language. This organization proposes to have branches in every congressional district for influence in legislation. Member, Woman's Committee for Recognition of Russia.

WOMEN'S COMMITTEE FOR WORLD DISARAMAMENT
Miss Emma Wold Secretary, Active member of Legislative Committee on Capitol Hill and is now doing legal research work for the National Women's Party.

Mrs. Raymond Robins (Margaret Dreier)—Member, National Women's Trade Union. Member International League for Peace and Freedom, Honorary President and Chairman Women of Industry (National League Women Voters and International Congress of Working Women, 1922) (Succeeded by Maude Swartz). Mrs. Robins paid part of bill, dated May 1, 1919, from the Rand Socialist School, made out to Santeri Nuorteva, secretary to L. C. A. K. Martens, the Russian Soviet Ambassador in New York, who was afterward expelled from this country. (See National Civic Federation Review, July 30. 1919. pp. 3, 12.) The Women's International Trade League is affiliated with the Amsterdam Socialist, International Federation of Trade Union, which the American Federation of Labor denounced as "a most serious menace to freedom." (New York Times, November 23, 1922.) The Women's League for Peace and Freedom, after their conference at The Hague December, 1922 sent envoys to this Amsterdam Socialist International Federation of Trade Union.

Mrs. Robins led a Red Demonstration May 20, 1907, consisting of 3,700 cheering, boisterous socialists, anarchists, trade unionists, members of liberal societies, etc., in Chicago, as a demonstration to create sympathy for W. D. Haywood, I. W. W. leader and fugitive from justice in Russia. (See Chicago Inter-Ocean, May 20, 1907).

Mrs. Gifford Pinchot, member of National Women's Trade Union. Mrs. Pinchot sixth on "Succor's List of Workers Party."

Helen Hoy Greely, Director from Missouri of the National Women's Committee for World Disarmament, active member International League for Peace and Freedom; Member of the Women's Committee for Recognition of Soviet Russia, among those distributing postcards "America, How Long Will You Tolerate This Shame? Free the Political Prisoners." (Sample attached.) Introduced Rose Pastor Stokes, who spoke to the Workers Party, Washington, D. C., May 30, 1923.

Mary D. Brite, Director from Ohio for the Women's Committee for World Disarmament in charge of children who picketed White House in 1922 (See Queally letter attached). Member of the Women's League for Peace and Freedom, active member of the Women's Committee for Recognition of Soviet Russia.

Belle Rankin, Member of Executive Board of Women's Committee for World Disarmament, secretary of American Union against Militarism which was instrumental in forming the Civil Liberties Bureau (Roger Baldwin. Anarchist. Director), co-operates with Socialist Party. Was very active in campaign repealing Lusk Law. After the Arms Conference Belle Rankin was Secretary for Libby and organized the Penguin Club and is now working for Senator LaFollette.

Florence Brewer Boeckle, Press Chairman for Women's Committee World Disarmament, National Council for Reduction of Armaments, now National Council for Prevention of War. and also Press Chairman for the National Women's Party. Member Women's International League for Peace and Freedom.

Lucia Ames Meade (wife of Dr. Edward H. Meade, German sympathizer). Mrs. Meade is an ardent internationalist and is the Director from Massachusetts for the Women's Committee for World Disarmament. Active worker and speaker for Women's International League for Peace and Freedom. Member of Women's Committee for Recognition of Russia.

Mrs. John J. White, member of Ex. Board Women's Com. Recog. Russia. Delegate to W. I. L. 1923 Convention. Boasts of making speeches in behalf of Jim Larkin. See data attached.

Sara Bard Field, Director for the State of California of the Women's Committee for World Disarmament advocates "revolution—peaceful if possible, bloody if necessary, in every land to establish communistic government to do away with war." (See data attached) Active member of Women's National Party; Member Advisory Council, 1921.

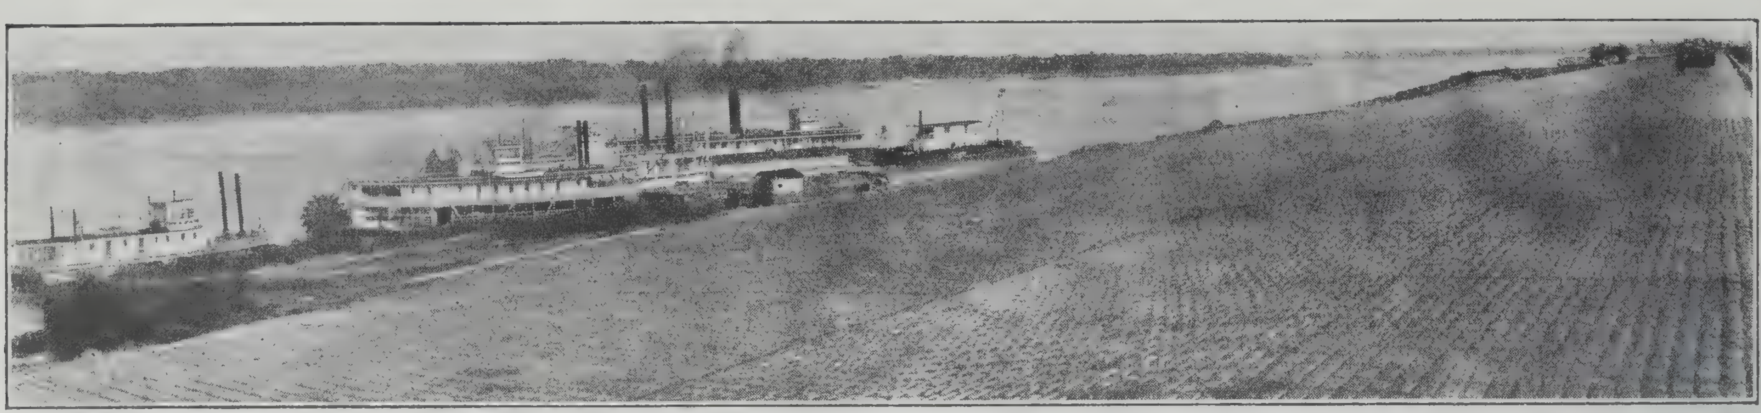
Crystal Eastman, Chairman W. I. L. New York City Nov. 28, at which meeting a pamphlet, Bolshevism Conquers, was circulated. Pioneer of National Women's Party, sister of Max Eastman.

Emma Wold, member International League for Peace and Freedom Secretary and organizer of Women's Committee for World Disarmament. Legal Research work for National Women's Party. Very active in Women's Committee for Recognition of Russia.

Miss Doty (wife of Roger Baldwin the intellectual anarchist) active worker of the Women's International League for Peace and Freedom. Courier for Russian Soviet Government.

—Miss Ury (wife of F. M. Leonard), U. S. Tariff Commissioner who is a brother of Mrs. Lynn Haynes editor of the Spot Light, formerly the Searchlight which, in 1921 published Harriet Connor Brown's America Menaced by Militarism containing the Slackers' Oath.

(C) 1924



The concrete wharf at Greenville, Mississippi, is one of the finest landings along the river.

In the Wake of Mark Twain

A Story of Steamboating on the Mississippi

By HARRY E. BARNET

“THE Devil's pet child,” is Mark Twain's description of Napoleon, Arkansas. So, when you start out to steamboat it from Cairo to the Gulf, you're anxious to see the place whose reputation was embalmed in competition with many other notorious landings. But you only start a glorious argument among steamboat men if you ask them to point out the town. At best it is a weak flicker across their memories, and the weaker the flicker the hotter the argument. Napoleon isn't there, and few persons know exactly where it was, which always leads Pintado, the pilot, to tell this story.

“It happened a long while ago, on the Lower Coast of the Mississippi, below New Orleans,” Pintado begins. “A young doctor was engaged to the daughter of a wealthy plantation owner. One night he took her to a dance. She wore a gown cut low in the neck and back. While he was dancing with her he glanced at her back, and saw a spot there.

“‘Let's go home right away,’ he said, ‘because I want to talk to your parents.’ The girl didn't know what the trouble was, but she went, and the next morning they were married.

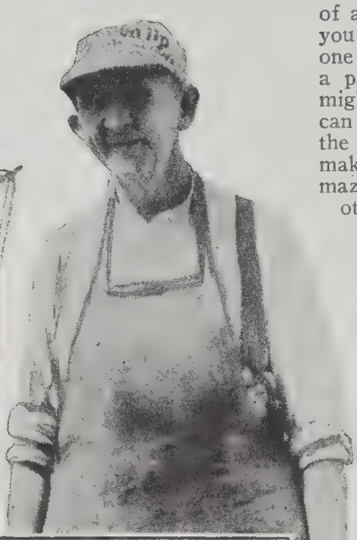
“Well, sir,” Pintado concludes, “that was a leper spot on the girl's back. The doctor took her away, and he spent his life studying leprosy. He kept the spot from spreading very much farther, but he couldn't cure her.”

A cotton boat on the Mississippi.

Pintado means to say that the Mississippi is like the leprous spot on the bride's back. Elsewhere is the enchanted spot to the stream, and it always is wandering about trying to go there—flowing here today; tomorrow eating a hole in the shore across yonder.

You fall in with the comparison when you even casually study the water in the channel, much less continuously look closely at it as a pilot must. You have no confidence in what you see, though the water flows swiftly enough, for it reminds you too much of the labor-in-vain bustle of an old-fashioned toper during one of his spells of “straightening up,” when he tried to create the impression that at last he was going straight.

Water from the Ohio River seems to hear the ancient leper cry of “Unclean,” when it pours into the Mississippi. It doesn't mix at first with the big river. For some distance it keeps aloof along the left shore. Two rivers flow in the same channel—the water from the Ohio in sharp contrast to the murk of the Mississippi. Of course, before they get to Memphis the streams mingle, but even then you have the half-notion that there never is very much of the fellow-wanderer feeling between the two, though afterward they hasten together over enough hundreds of miles to become quite chummy.



Above—“Gravy Joe,” a river character.

Below—A typical landing on the Ohio River.

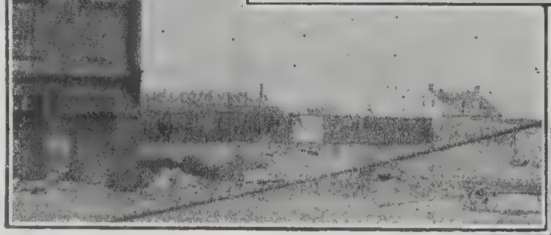
Furthermore, when the Mississippi eats into the shore it doesn't snap off chunks of land, and gobble them whole. It silently and slowly permeates the soil, until acres of it sometimes squash suddenly, carrying everything that is on it—towns, trees, buildings, animals, and even human beings. You see the principle of it if you top a mound of brown sugar with tiny dolls, toy animals, and small playhouses, then set one side of the sugar against an inch or two of quivering water. The soil is carried in solution to another place, where the river either builds a new shore, or starts a towhead that may become an island.

Mark Twain had a lot to say about towheads and islands, and you probably have the idea that somehow they are distinct affairs; but to your layman's eye they're alike, unless the towhead is very young. Then it is a wavy stretch of glistening sand, sitting prettily amidstream. The name comes from resemblance to the hair of a vividly blond woman, freshly shampooed, and turned loose to ripple dry in a breeze. Towheads are formed by obstructions in the stream. Drift accumulates. Deposits of mud on the drift build up the towhead, with a sharp point, like a boat's nose, sticking into the current. Soon after they appear, towheads bristle with cottonwood, willows, and plant growth. If they last long enough they become landmarks for pilots, and are named islands. Age and the ability to withstand attacks by the river determine the name, towhead or island. If you're sitting forward on the roof of the boat when a cluster of towheads comes in sight in the wide stretch of the Mississippi, you get the sensations of a stranger afoot in the Circle in Indianapolis. Before you there are probably half a dozen rivers, but which one of them is the channel? After the boat noses into a passage you realize why the pilot is the high-and-mighty man Mark Twain pictured him, especially if you can imagine the same approach and progress through the darkness of a stormy night. It is not uncommon to make use of five or six landmarks to get through the maze—steering this way, then twisting suddenly in the other direction. Of course, there is this much to be said about the Mississippi River: it is what is left of a big arm of the sea that reached to where the Ohio empties into the Mississippi—and the sea is restless. This restlessness furnishes plenty to talk about when you steamboat it in the wake of Mark Twain. And you hear it from the pilots especially, for they have to be the most observant of all travelers. They know the odd happenings from one end of the river to the other. Pilots work alone for a good many hours at a stretch. When they get a chance to talk they “make hay.” Sometimes they make a little more hay than the subject warrants, wherein you have the origin of their reputation for “tall yarning.”

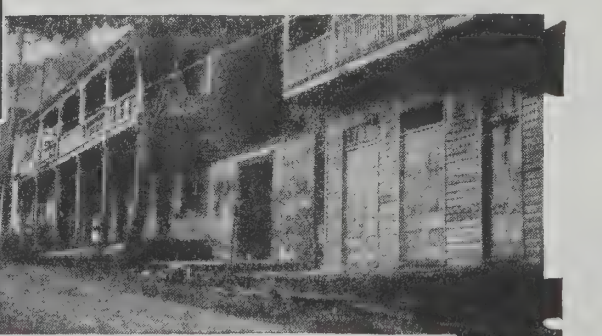
Be that as it may, by changing its channel in about the time it takes a lusty pup to grow old and feeble, the Mississippi changes inland towns into river ports, and leaves river ports four and five miles in the back country. Once in a while the river does a town a good turn in this way, meaning Arkansas City at the moment. Chicot City was started to put it out of business. For a long time before this, Arkansas City was glutted with scalawags and jades, and in general it was as wild a place as you'd care to be turned loose in without warning. More than a generation ago one of the big New York newspapers commenced to print a story each week about the poker games of its wild-oats days, and interest in these stories keeps up. But that is going over old ground. Arkanses City settled to staidness, and Chicot City was eaten alive by the river. Mottled water rushes through the willows that wave above the spot where it stood. Not far away, Huntington and its railroad went down and under. Napoleon, it is claimed, met the same fate.

Do you remember, in “Life on the Mississippi,” when Mark Twain was tested as a pilot? Where he was left alone to make the cross-over is dry land, covered with timber and rank jungle growth. In the 1870's the *Wauhatchie Belle* sank, and all traces of her were lost. The river covered the boat with sand and debris, and then picked that spot as part of its channel. Three or four years ago, the Mississippi began to cut a new channel in a different direction, and the stacks of a sidewheeler emerged from the mud and receding water. At that time no one knew the name of the boat. Not until old pilots checked the craft lost in that vicinity did they discover that the *Wauhatchie Belle* was the only sidewheeler among them. The river partially unearthed the boat, but before the job was completed the stream shifted back, and again interred what it had brought half into the light. With Prohibition came a new game on the Mississippi—hunting buried steamboats beneath the forests and undergrowth on sandbars in abandoned channels. Most of these buried craft carried cargoes of whisky. It sank with them, and still is there, as far as anybody knows. The effort is to find it. So far, the game hasn't been worth the candle. Sand slips into the excavations as fast as it is shoveled out.

Log rafts and shanty boats, drifting along without lights, were one of the troubles of pilots in other times, according to Mark Twain. That trouble is over and done with. Population that lived in the craft is dwindling to the point where, in some localities, they're a bit of a



The town behind a levee, the latter protected by a wooden sheeting.



What is left of “Natchez Under the Hill.”

Clearing lands behind the levee.

Weighing cotton in newly cleared country behind the levee.

curiosity. Disappearance has been speedy. A few years ago river dwellers were numerous enough, and they carried on all sorts of businesses. There were blacksmith boats, and medicine boats; trading boats, where old iron and bones could be exchanged for anything under the sun, from a needle to glassware and clothing; and on other junk boats cash was paid for old iron. A lot of this "old iron" was new parts for plantation and sugar-house machinery. It was not uncommon to see new engines, if they were small, and other things made of iron, in the collection. Thievery of this sort was one of the vexations of a plantation owner. The junk was piled high on the roofs of these boats. In the cabin beneath the weight the trader lived with his family. No one seems to know of an instance where a roof caved in, though the ramshackle craft were subjected to terrific strains in the shore swells from passing steamboats.

Also, there were grocery boats, and saloon boats—in fact, almost every sort and kind of legitimate and illegitimate business, as well as pure vice, that flourishes ashore, was duplicated and afloat. These boats had no power; they drifted downstream, and tied at likely looking landings. People came there from miles around to trade. Stocks were not always enticing. Clothing boats, for instance, usually were filled with a type of merchandise that could find a place only in the lowest grade of second-hand stores on shore. Yet it was sold at big prices. When business went bad, the boats drifted elsewhere. But the bulk of this business has been done away with, since fast freight service by motor boat and truck is an everyday affair.

In "Huck Finn" you've probably taken the adventures of the "Duke" and his companions to be unusually "tall yarning." On the contrary, it keeps very close to general facts about shanty-boat people who worked at all sorts of professions. And, in milder ways, they're still at it. A doctor, for instance, recently retired with a comfortable fortune, all made in a few years. He traveled in a glorified shanty boat with three rooms. His office was the front room. Between it and the middle room was a very thin partition. When the craft tied at a landing, and the first ailing darky came aboard, he was met at the door by the doctor's wife.

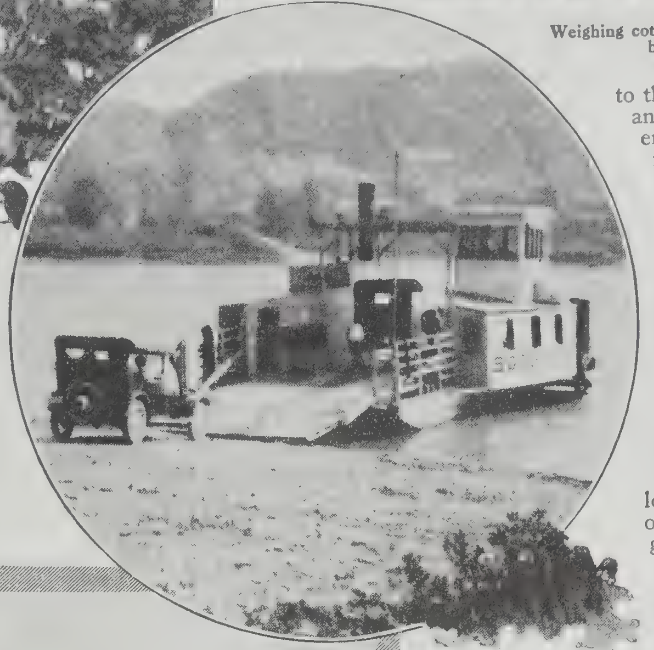
"The doctor isn't here just now," she said, "but just come on in the office, and wait awhile. He'll be here shortly."

While he waited, the woman talked to the darky, and got the history of his afflictions and all his symptoms. The doctor was seated on the other side of the partition.

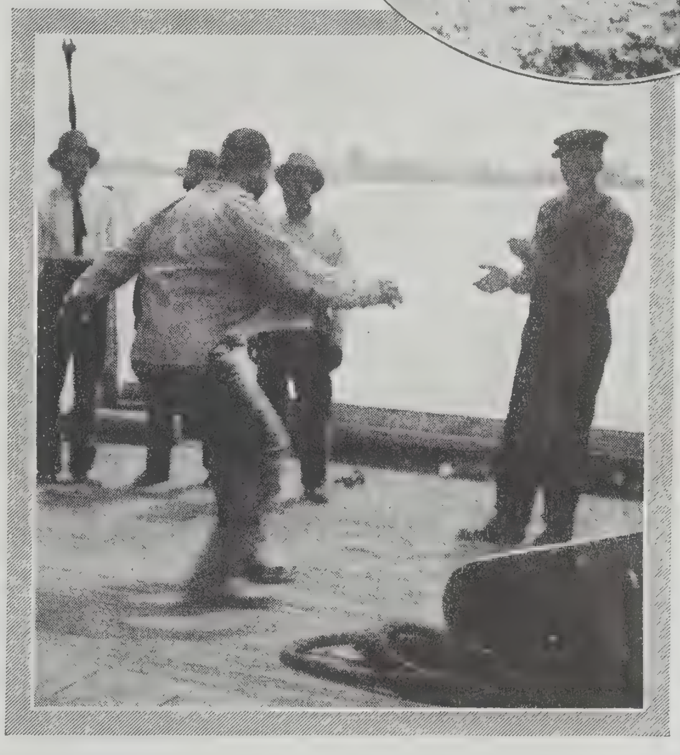
"Not a word," exclaimed the doctor when, with his right hand upraised as a warning, he stepped pompously into the room later on, "not a word from you. By looking at you I can describe every ache and pain you have, and where it is."

Seating himself before the patient, and looking at him intently, the doctor did that very thing. The darky sat open-mouthed, and listened. When he left with a bottle of medicine in each hand, he lost no time spreading the news that a wonder man was at the landing. Before night the shanty boat was overrun with patients, willing to give their last nickels to the doctor for medicine.

As a rule, islands and towheads have a big acreage. Some are under cultivation. The majority shelter a picturesque population that lives half-afloat and half-ashore—shanty-boat people, who work a few days on a neighboring plantation, and loaf a month to recuperate; fishermen, hunters, and "dehorners of logs," to name a few. The rarest of good luck is with you if you see a log raft equipped with the type of oars and sweep of Mark Twain days—they're scarce, but not entirely of the past. There are rafts towed by steamboats, and small motor boats. They come out of tributaries. Logs break loose from these rafts, and men live and lurk on islands and towheads on the lookout for them. Upstream, these men can see a saw log in a mass of drift before the average of us can distinguish anything more than a floating mass, and they row out to intercept it. Logs are branded on the sides and ends to the depth of a quarter of an inch to show the ownership. "Dehorners" cut four inches back from each end, and gouge the same distance, to destroy the end and side brands on the logs they capture. Then the prizes are towed to a sheltered place until there are enough of them to make a raft big enough to bother with, when it is floated to a sawmill and sold.



A landing at Constance, Kentucky.



The original "Steamboat Bill." Types of rousters who today have practically disappeared as familiar figures along the Mississippi.

Lately, moonshiners load stills and material on fast motor boats, and go to islands and towheads that are covered with dense growth. The mash is cooked there, and put in the stills, which are left on the boats. The latter range the river, or lie in sheltered places, while distillation goes on. If enforcement officers give chase there is as pretty a speed contest as you want to see. Should the outlaw boat be overhauled, the still is dumped overboard and there is no evidence.

The Mississippi does its devilment, except in rare instances, between the levees, and against them. The embankments have repeatedly been moved back, and made higher. All the buildings in one Missouri town have been put on rollers and moved back six times. In a few places, plantation homes that years ago were far away from the river are now just behind the levee. Cross sections of parts of old levees are standing, and they furnish a good idea of levee construction, and the heights of various embankments. In the old days, two "rousters" could roll a barrel of sugar from a steamboat, and up and over a levee. Nowadays, there are places where sixteen men are required to do the same thing. Down Greenville way, the crown of the levee is to be a tourists' highway. The Greenville landing is the show place of the Mississippi. It is a concrete layer up the side of the levee, 700 feet long, 400 feet wide, and with a one to seven slope to low water.

Between the levees and the water is jungle-covered waste land—enough of it that is rich to supersoil another Holland, if there were a foundation on which to put it. In many places this land is dotted with abandoned and tumble-down quarters of plantation "hands," and cabins of fishermen, built on stilts in clearings. The shore is several feet above the water at normal stage, and it is straight up and down, as well as badly gnawed by the river. There are no rocks nor gravel in it, and as you ride along these places give you the best view of the leprous action of the Mississippi. Occasionally, an acre or more sinks down, with whatever is on it. Live stock float downstream till they drown. Trees lie half-submerged, or stand on their heads, but they attempt to live by sending out branches and leaves.

For the most part, however, the shores of the Mississippi that you see from the boat give you no more of the feel of confidence than does a study of the water in the channel. There are no beaches. Occasional sandbars reach channelward from the shore. They are bare when they are new. Even with the waterline, cottonwoods, willows and shore growth begin. They form green walls, though which you ride for hours. As the river is twisty, you never see very far ahead or behind you—the impression is of being shut in a green world from which there is no escape.

From Baton Rouge to New Orleans, the levees are in sight. Smooth stretches of grass are between the water and the levees, and behind the latter the roofs of plantation homes, sugar houses, and quarters for the "hands" just show over the tops.

Behind the levees, from Kentucky and Missouri to the Gulf, are 20,000,000 acres of land that have been cleared and put to good use in recent years. If you dig down one hundred feet you still find the soil black and rich. It is estimated that the first seven inches will produce one hundred crops of cotton, or one hundred crops of corn, or eighty years of other standard crops, without fertilizer. There is a different class of people from the picturesque type Mark Twain knew there when he was a pilot, and even when he was writing "Life on the Mississippi."

Why Don't Women Investigate Propaganda?

Concluded from page 10

We can uncover all of this if we have a committee charged with making a thorough investigation."

Mrs. Isabelle Ball, past president of the Women's Relief Corps, followed and said: "I see no reason why all should not desire the appointment of such a committee. No one asks to have some outsider investigate for us. The proposal is that we shall appoint a member from each organization and investigate it for ourselves. Why should there be any objection to it? I hope that this resolution will be passed."

The Resolutions Committee was composed of Professor Marion F. Whitney, Chairman, Pacifist and member of the League of Women's Voters; Miss Anna Gordon, president of the Women's Christian Temperance Union, also a Pacifist, but less extreme in her views than Miss Whitney, and Mrs. R. Emmet Digney, past president of American War Mothers. It was reported privately to many delegates that the resolution would never be reported out of committee. The president of the council, Mrs. Moore, as confidently stated that it would be reported out of committee. Efforts to persuade Mrs. Digney not to put in a minority report failed because Mrs. Digney is too well informed on the subject of propaganda and has seen too much of its operations in her own organization (The National War Mothers) to be influenced by the Pacifist members of the committee. She brought in her minority report. The majority report was against passing the resolution because they thought it best to let each organization make its own investigation. Mrs. Moore, knowing that the majority of the organizations represented were in favor of the resolution and that they were at white heat because of the methods employed to defeat it, called for a vote of the delegates. The vote was taken three times and stood twenty-three for the passage of the resolution and fifteen against it.

Dr. Valeria H. Parker, director, department of social morality, National Women's Christian Temperance Union, voted against the resolution. She said, among other things, "To admit the need of such an investigation would stamp us all as dupes." Coming, as it did, after the enlightening statements that had been made with regard to the brains and money in the service of the propaganda, this remark was received with smiles.

It is significant that the resolution to appoint a committee for the investigation of propaganda was favorably voted upon by a majority of twenty-three delegates against a minority of fifteen delegates opposing. It is significant because it proves that, once they are informed, the majority of women do not favor the Radical-Pacifist program despite the cleverly contrived appearances to the contrary. It remains now for those women who are awake or wakening to the real objectives toward which the radical leadership is guiding their truly patriotic but unsuspecting sisters, to undertake a rather vigorous house-cleaning.

Argentina Turns to Sports for Advertising

South American Nation Takes Its Place in International Athletics; Polo and the Great Firpo Outstanding Examples of Its Achievements

By A Veteran Sports Writer

ARGENTINA, ambitiously reaching out for greater recognition in the fields of commerce, has suddenly found herself elevated to a more advantageous position through her activities in sport. This means of gaining recognition may appear poor policy to the average man; still it is the method used by our leading educational institutions. The universities and colleges of the United States long since discovered that to bring national repute to the institution this end must be achieved not through educational methods but through athletic accomplishments. That is the reason such vast sums are spent each year for coaches and athletic funds that are expected to produce winning football elevens and teams able to win in other college sports, but chief of all, football.

So great has become the rivalry among the colleges and universities in athletics that the more serious-minded educators are debating whether the present method of procedure in developing winning teams is undermining the entire structure of higher education in this country and in a large number of institutions steps have already been taken to curb to some extent the activities. But the method continues, for winning teams mean newspaper publicity and newspaper publicity means a higher standing for the institution.

This matter of college and university athletics is a subject of prominent discussion and it is not our intention of dissecting it, these paragraphs being written merely to show that Argentina has done nothing unusual in turning to sports to gain world advertising. In the last twelve months Argentina has become the most discussed country on the other side of the equator and the commerce of the Argentine is now prepared to take advantage of the prominence achieved.

Play Championship Polo

ONE year ago the Argentine interested few persons outside of those who had direct business relations with native firms or individuals, but today the people of several nations are making inquiries about the Argentine. They are anxious to know the manner of people that live in that South American republic and the manner in which they live. They are studying their characteristics. While for several years Pan-American congresses and delegations from the two Americas have been trying to reach a better understanding and arrive at more intimate relations, Argentina solves the problem for herself with a few victories in sport—and she accomplishes this in one year.

In the late summer of 1922 there came to the United States a representative polo team from the Argentine. This team invaded England before coming to North America. In England the Argentine four played brilliant polo and in this country they did even better, winning the national championship for 1922. When they left the Argentine, the polo team took fifty native bred and schooled ponies. In England they sold twenty-five of these and the remainder were brought to the United States. After winning here the Argentines sold the other twenty-five.

The victory of the Argentine four on American soil was startling. The readers of the sport pages in American newspapers had never heard of polo being played in the Argentine and when the South Americans came here it was regarded as a pleasure trip. No one gave them serious consideration, but not alone did the South Americans play clever polo, as one may surmise by considering the result of the matches in which they engaged, but they showed some of the best polo ponies that have played on American soil. They were fast, sure-footed and always boring in. They showed the result of careful and intelligent schooling.

Not New in Argentina

WHEN the remainder of the Argentine string of ponies was disposed of in this country, Americans concluded that Argentina had decided to abandon the game, but this brought new information. Not alone did Argentina take no such action nor contemplate doing anything of the sort, but spurred on by the success on American soil, the South Americans took to the game with new enthusiasm, vigor and interest. The string of fifty ponies that they took to England was only part of a large field of polo ponies. There undoubtedly were left in the Argentine several times that number of ponies just as good as the group that was shipped overseas.

Argentina has been looking for years for world supremacy in some of the major sports. Those of the Argentine are showing, and have been showing, an intelligence and perseverance that most of the Anglo-Saxons lack. They have a keen love for thoroughbred racing and in pursuit of this sport "the improvement of the breed" has been more than a byword in the Argentine. The men who are interested in racing tried to breed faster and better horses and gave the matter intelligent thought instead of trusting to the luck of breeding. To secure a better breed of thoroughbreds they bought Diamond Jubilee, Craganour, Cylene and Tracery, among other stallions. These four are mentioned, for the purchase price for each member of this quartet of great turf performers was $150,000 or more. The highest price, one of $264,000, was paid for Tracery a few years ago.

Polo has been played in the Argentine for a long time. The game is supposed to have been tendered its greatest development in England, with the United States and India not far behind. In England, at least, the game has been the sport of British kings for many years. In England and her possessions the breeding of polo ponies has been a matter of serious consideration for years and much time, money and effort have been spent to produce better ponies, so imagine the consternation caused when the Argentine poloists invaded the northern countries with ponies that are considered equal to those of the ancient polo countries. The conclusion is immediately arrived at that Argentina must have been badly misunderstood these many years.

Want International Matches

ARGENTINA is not satisfied with her polo accomplishments of last year. At present there comes from the republic a demand that international matches be arranged, fashioned after the Davis Cup matches. Every polo-playing country is to send a team or two and world supremacy in the game is to be firmly established. Argentina wants this done and in making the request Argentina must be confident of being successful. To beat the Anglo-Saxons at their own game would be one of the master achievements of this South American republic and would surely do more to bring about greater respect and interest than a dozen expensive Pan-American congresses.

The achievements in polo were the first of a series of accomplishments that have made the Argentine the great challenging nation of sports. During the summer of 1923 Enrique Tirabocchi, a wealthy manufacturer of the Argentine, went to England. He tried to swim the English Channel, considered most difficult of all swimming feats, calling for stamina and endurance. Tirabocchi failed. He stayed on. Once more he tried to swim the English Channel and once more his attempt ended in failure. But he remained. For a third time Tirabocchi dropped into the turbulent waters that separate England from France and this time he reached the opposite shore. Not alone did Tirabocchi of the Argentine swim across the English Channel but he created a new record in swimming it. The wealthy Argentine manufacturer swam the channel in sixteen hours and thirty-three minutes on August 12 and he thereby broke a record that had stood for forty-eight years. Captain Webb, most famous among the swimmers that have tried to cross the Channel, accomplished the feat in 1875. It has been done a few times since but never, before Tirabocchi's trip, was it made in as fast time as Captain Webb made. Most astounding of all was that Tirabocchi's time was more than five hours under the record of Captain Webb. Tirabocchi's channel was the greatest publicity stunt that has been done in behalf of Argentine manufacturing.

The feat of the South American manufacturer was still under discussion when Luis Angel Firpo, the swarthy giant, fought Jack Dempsey for the heavyweight boxing championship of the world, most coveted of all boxing titles. It took Dempsey less than four minutes to win over Firpo, but several times Firpo was on the brink of winning the world's title. He gave Dempsey the hardest fight of his career.

Boxing, you will say, is a poor way to advertise a nation, but we still have to meet an American who is not proud that his country is supreme in the sport. It is a national boast with us and the boast we make most frequently when visiting outside the borders of our country. Of all the feats performed in sports in the last twelve months by athletes from the Argentine, the accomplishment of Firpo was the most widely discussed and will continue to be discussed in most of the countries in the world's two hemispheres. Practically every profession and every form of labor was represented at the ringside when Firpo made his memorable onslaught and the newspapers printed columns of details and comments for days after the fight. South America once more jumped into the newspaper headlines and with credit.

The Argentine is not confining her activities to the sports here mentioned by any means. The country is developing tennis players that must be reckoned with in international competition and her soccer teams are beginning to demand attention. The republic is extremely ambitious in track and field athletics and the challenging cry of the next Olympic Games will probably not come from the expected quarters in England, Finland and Sweden but from south of the equator in the land that is the Argentine.

First Latin Challenge

FOR the first time since the days of Rome has the challenge been sounded by the Latin races. When the sports glory belonged to Rome and her gladiators made holidays by battling unto the death with metal weapons, the Latins ranked supreme, and now, centuries later, the menace to Anglo-Saxon supremacy is suddenly developed south of the equator.

Argentina is equipped to challenge the world. Her people are bigger and stronger than the Latins of the South of Europe. They have grit, determination, stamina, courage and spirit. They carry the stuff of which champions are made. They have most of the admirable traits of the Anglo-Saxon, but it required an actual display in competitive sport to impress this fact upon the world. No one would ever have realized this if the matter had remained in the hands of the international propagandists and those whose efforts are directed toward establishing relations between the two Americas. Argentina realized this and set about to win her place in the sun in the manner described. It has proved successful.

The Theater's Three Doodle Doctors and One Saint

Concluded from page 2

sanctification are to be judged. But while "St. Joan" may be delighting the "intellectual" Hebraic cult which dominates the Theater Guild and alternately befogging and paining other patrons of the Garrick Theater, there is no sign from Rome that the Vatican has thrown its age-old rules of canonization into the Tiber and adopted those set up by Dr. Shaw. In the process leading up to the enrollment of any name in the category of saints there is in the last stage a person whose duty it is to introduce all possible evidence and arguments against the life and record of the candidate. He is called, in the language of the church, "the devil's advocate" and his office is an appointed, not a voluntarily selected one. Dr. Shaw has chosen that grizzly rôle for himself and his line of action has been to laugh the candidate out of court.

Dr. Cohan's "The Song and Dance Man" has none of the pretense of his competitors' nostrums. It is a special plea for the downtrodden buck-and-wing specialist and shows that despite all the slings and arrows of outrageous fortune a true gentleman's heart may beat above a pair of wooden shoes. Dr. Cohan has evidently dramatized the personal qualities which he is credited with having and in Hap Farrell, the Wilkes-Barre "hoofer," we have Geogre Michael himself as he is pictured in song and story. Hap's partner, another escaped breaker boy from the hard coal region, is taken care of in his dying moments by a young actress and her mother. Out of gratitude for that act of charity Hap dedicates his life to seeing that Leola Lane gets a chance to see her name on The Great Shine Way. He does it by holding up at the end of a revolver a rich youth who has a theatrical boss for his friend and in three long talky acts succeeds in making Leola a stage sensation although, like all other heroes, it means his own elimination as a song and dance man. At least you think that's what it means until Dr. Cohan sends Hap out into the great wide West where he makes himself so important in the mining world that he gets thousands of dollars a year salary. Then when you imagine that he has settled down to be an honest-to-goodness financial shark if he doesn't throw up his job and go back to the stage to have another hack at the song-and-dance business. The moral of the play is, "Be what you want to be no matter how much money there is in being something else." The play is Dr. Cohan as his admirers paint him and it is a triumph of actor over author. No one but the doctor himself could make it live and that he does so is due to the fact that years ago he provided against the rainy theatrical days by making thousands of friends via the Star Spangled Banner and Dear Old Broadway formula of Doodle.

One thing about Dr. Cohan must be said. In all his career as brain food expert he has never used adulterants in his stuff. It may be bosh, theatricalism, and even nonsense but it has always been clean and washed. He has never relied on sex or smut and because of that many things can be forgiven him. Besides, if we must be fed Doodle, by all means let it be the "Made in America" brand. Dr. Cohan's "Yankee Doodle Dandy" will hurt nobody. It is good for man or beast, women and children and can be taken in large doses without causing loss of circulation, sourness of stomach, or bitter taste in the mouth. But Dr. Cohan should not ask us to believe that Leola Lane became a star after singing a verse of a song, doing a few dancing steps, and reading a couple of lines to a theatrical manager in his office. It simply isn't done—except in plays.

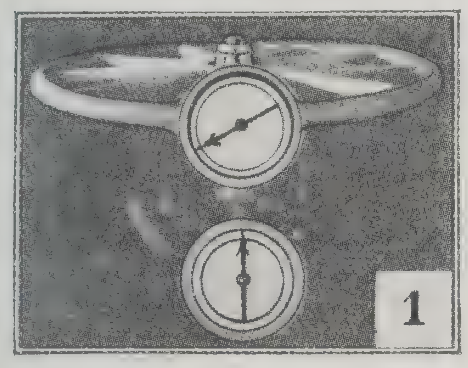
International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

The Einstein Film and the Debacle of Einsteinism

DR. GARRETT P. SERVISS has written a book entitled "The Einstein Theory of Relativity," based upon "The Einstein Relativity Film," produced by Mr. E. M. Fadman. Although the presentation of the material is excellent we cannot agree with the conclusions. We are indebted to this work for Figures 2, 3, and 4, and to *Science and Invention* (June, 1923), for Figure 1.

Einsteinism teaches that "measuring rods and clocks create space and time." We hold that special and temporal properties of matter are *revealed but not created* by measuring instruments.



The rim of the wheel represents the orbit of a planet. The clock on the rim is supposed to run slower when the wheel rotates. The Einsteinians conclude that time is relative and that "the clocks create time."

The device shown in Fig. 1 is supposed to retard time. In *Science and Invention* the following legend appears under the figure: "Measuring Time with a Light-Ray." Einstein has devised a formula involving the *absolute* velocity of light, by means of which "the variation of time—measurement produced by motion"—may be determined. Therefore, we assume that the Einsteinians mean what they say when they assert that time may be measured with a "light-ray." This conclusion is directly contrary to the legend printed below the figure, and therefore in accord with the usual results of relativistic speculations. The average man will ask: "Do the hands of the clock actually rotate at a slower speed when the wheel is in motion?" *Science and Invention* anticipates this question by stating: "This mechanical illustration is purely theoretical." In fact, it is so marvelously *"theoretical"* that the device will be utterly demolished into mere fragments long before the "hoped for" effect can be observed.

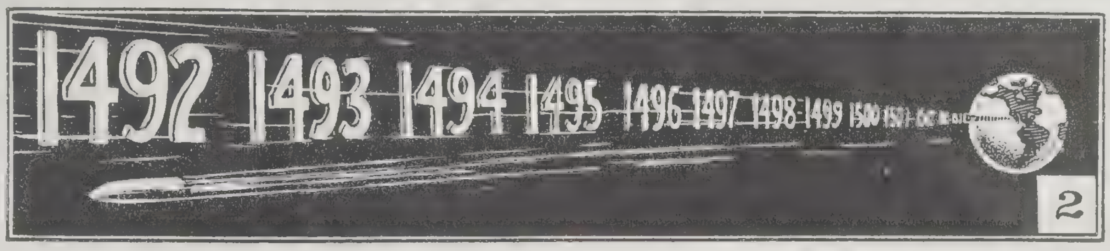


Figure 2 is supposed to indicate what happens to a man who travels in a projectile whose speed greatly exceeds that of light. If he begins his trip in 1924 he will, according to the Einsteinians, pass by former centuries just as if they were places, and eventually overtake Columbus discovering America.

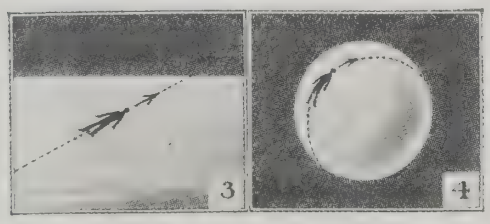
It is the Einsteinians that are solely responsible for the "slowing down" of the clock; not the rotation of the wheel. They have "slowed it down" just enough to compensate for the time it takes for the light-ray to act as the recording messenger between the moving clock and the relatively stationary observer. There is nothing marvelous in that idea except the confusion and the inconsistencies which are spun about it.

Were it not for the *"Second Postulate of Relativity"* there would be no Einsteinism. This *pure assumption* is that the velocity of light will appear to be the same amount to any observer no matter how fast or slow he travels. Even if he remains stationary in respect to the earth the result is supposed to be the same. This is what a modern relativist means when he speaks of the *"absolute velocity of light."*

With utter nonchalance Einstein and his disciples, after having named this *"absolute velocity of light"* a *"postulate,"* proceed to use it as a fact. The velocity of light, however, cannot be determined by the methods of Einsteinism. No, indeed; the old classical mechanics must be used in that most important determination after which it is discarded as inexact and not "up-to-date." In other words, Einstein's entire structure has been erected upon a foundation whose validity is thereafter denied by the builder. That he realizes this vital conflict between classical mechanics and his own system is indicated by his frantic, but futile, attempts to reconcile these two irreconcilables.

We are now prepared to appreciate the contradiction involved in the Einsteinian legend appearing below Fig. 2. The projectile is supposed to travel with a "speed which greatly exceeds that of light." The very foundation upon which Einsteinism rests is that no velocity can exceed that of light. Thus the modern relativists reason ruthlessly from premises which are impossible according to the fundamental tenets of their own theory. No wonder that the impossible can be accomplished from such Gargantuan inherent inconsistencies. Time is not reversible. We can only reflect upon the landing of Columbus in America by an act of memory concerning historical statements printed in books. Time is not a series of places which can be actually passed through in two opposite directions. We are charitable if we speak of these alleged profundities as mere fairy tales. Such balderdash is an insult to common sense.

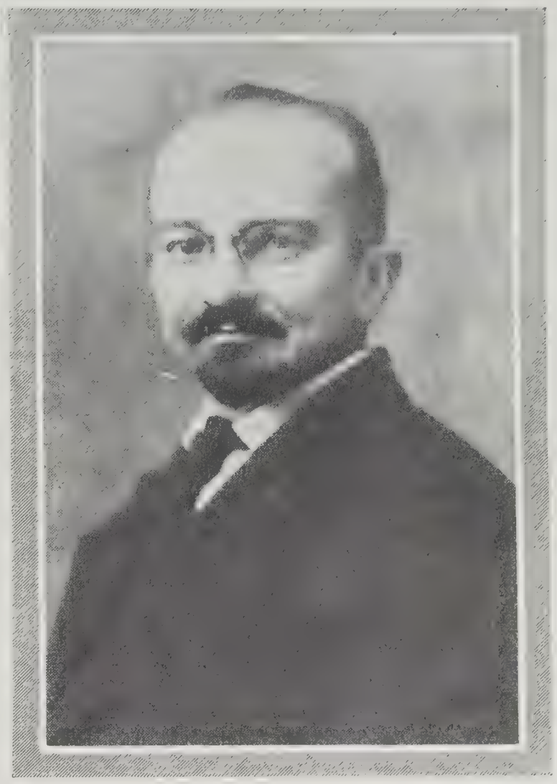
In Figures 3 and 4 we are requested *seriously to imagine what a man of "no thickness" can experience.* From this impossible and ridiculous assumption we are asked to admit that we live in a four-dimensional space without knowing it. We admit that we are not aware of this four-dimensional space, but we refuse to accept, as physically real, anything that is derived by analogy from that which is impossible. Mathematical expressions, supposed to portray this four-dimensional space, depict nothing but conceptual speculations having no counterpart in a real physical world.



3—Supposed to represent a "shadow man" having surface extension only but no thickness and consequently living in only two dimensions. It is assumed, in the doctrine of Einstein, that this man of "no thickness" travels along what he believes to be a straight line. 4—In this figure the "shadow man" is assumed to be traveling around the earth in a circle, passing through the starting point as often as his endurance permits. The conclusions drawn by the Einsteinians are: (1) the "shadow man" lives in a world of three dimensions without knowing it; (2) therefore we must live in a four dimensional world without recognizing the fact.

Practically all of the purely Einsteinian portions of the Film are based upon gross incompatibilities which are in glaring opposition to facts. The views which are true must be accredited to the old school of classical relativity.

The modern relativists have recently been forced to take note of the many recent exposés which have been made concerning the sameness of Einstein's 1911 formula for the deflection of light with Soldner's formula of 1801. The writer was the first in the United States to call attention to this fact. The Einsteinians have tried to ignore the attack but the opposition has grown to such proportions that they have been forced to reply, by proxy, for Einstein. In *Science* (August 31, 1923), Dr. Robert Trumpler calls attention to the *error in Soldner's work.* Note that it is Soldner that is wrong despite the fact that Einstein's 1911 formula is identical with that of Soldner. It is also curious that when Einstein tried again in 1916 to produce a formula it did not agree with his first effort, in fact, the 1916 formula gives a value twice as large as the one of 1911. Both are right according to the Einsteinians:—*two equals one.* In the presence of the mighty "invariants" and "covariants" of modern relativity such mere trivial inconsistencies must be ignored as negligible "Einsteinian effects."



PROFESSOR E. GEHRCKE,

Successor to H. L. F. von Helmholtz as Director of the Physikalisch-Technische Reichanstalt at Charlottenburg, one of the greatest of modern physicists, who, in the year 1916, exposed the Einsteinian use of Gerber's earlier formula of 1898.

Dr. L. P. Eisenhart, of Princeton University, in the same journal (December 21, 1923), tries to assist Dr. Trumpler in the defense of Einstein in the Soldner-Einstein case. The real issue is carefully avoided. He, however, makes the following interesting statement: "Hence the velocity of the light from a star *decreases* as it approaches the sun." The Soldner episode seems to be a powerful stimulant in the revealing of inconsistencies. The Einsteinians are actually getting hysterical in the presence of the specter of Soldner. We have previously stated that the Second Postulate of Einsteinism precludes any change in the velocity of light. Despite that alleged fact, Dr. Eisenhart, defending Einstein against Soldner, discovers that the Einsteinian formula indicates a *"decrease"* in the velocity of light. Will the marvels of relativity ever cease?

The latest interesting event (not for public consumption) is the fact that Dr. W. W. Campbell's revised calculations for the deflection of light show an excess of seventeen per cent above Einstein's prediction. This disagreement is fatal to Einsteinism. By the *"two equals one"* process, the excess can, however, be subtracted, by the Einsteinians, from the observed result, thus producing exact agreement, provided that a name, "Courvoisier refraction" or any other equally convenient label, be applied to it.

The specter of Gerber (whose formula of 1898 is identical with the Einstein formula of 1916), first revealed to the Einsteinians by Dr. E. Gehrcke, is awaiting justice by the side of Soldner. We foresee the usual relativistic evasions and defense of Einstein, by proxy, but the result will finally be a thorough exposé of the fiasco of Einsteinism. Now that the Einsteinians have been forced into the open, the complete debacle of Einsteinism is inevitable in the near future.

THE LIBRARY OF
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

The foreign-born in this country sent $400,000,000 abroad during the last fiscal year. This, together with the expenses of our tourists in Europe, our gifts for relief purposes and other items not only wipe out the trade balance in our favor, but it even appears that Europe in 1922 got the better of us by about $500,000,000.

Changing fish to water of a different temperature from that to which they are accustomed will, according to a Danish scientist, after several generations, produce a new type, modified in form and structure, especially in the rays of the fins and the number of vertebrae.

Four more towers at the Tower of London—the Martin, Salt, Broad Arrow and Byward towers—are to be opened to tourists in April.

Wooden houses are rare in Belgium. Real estate is high, lots are small, and the yards which Americans enjoy are unknown except for villas owned by the well-to-do.

A German woman, newly arrived from the old country, believing she had arrived in the land of wild Indians, of whom she had heard much while living in her old home, refused to leave a train when it arrived in Leavenworth, Kansas. It was necessary forcibly to remove her and not until she saw her sister and had been assured of her safety would she believe she was in a civilized community.

Mount Kilimanjaro, in Tanganyika territory, Africa, is 19,900 feet high, the highest mountain on that continent. It is near the equator and is covered a third way down with perpetual snow.

For the first time since 1896, the St. Lawrence River at Quebec was this winter blocked with ice.

Missouri Bureau of Labor Statistics reports that 8,789 farms of Missouri farmed or supervised by women are more profitable than are average farms controlled by men.

A primitive people, living in holes in the ground and believed to be descendants of a race antedating the Arabs in North Africa, were found by a Fellow of the Royal Geographical Society a few hundred miles south of the Mediterranean coast in Africa. Here dwell more than 12,000 souls, without tents or houses, living in subterranean homes which are entered through sloping tunnels. They are Moslems and extremely fanatical.

Forty-two per cent of the farmers covered in a recent survey feel that their financial difficulties are due to low prices of farm products. Seventeen per cent attribute their condition to high taxes; eleven per cent to high costs for farm labor; ten per cent to high freight rates; ten per cent to high interest rates; six per cent to reckless expenditures during the boom period; and four per cent to too much credit.

Colgate University paid $5,000 for one of the twenty-five dinosaur eggs found by the American Museum of Natural History in the Desert of Gobi, Mongolia. The egg is 10,000,000 years old.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The people of Czecho-Slovakia, regarding the late President Wilson as the founder of their republic, have named various parks, streets and buildings after him. The latest is the new Wilson Station in Prague which is the meeting-point of all railroads leading out of the capital to Poland, Germany and other countries.

The expression, "Lo, the poor Indian," is from Alexander Pope's Essay on Man. It occurs as follows: "Lo, the poor Indian! whose untutored mind sees God in clouds, or hears him in the wind."

Professor Richard Burton has pronounced the last word on "Main Street." He says the author wrote about only one side of the street.

The author of the song "It's a Long Way to Tipperary" died recently at his home in Coventry, England. This song was one of the most favored during the war.

Sixty-six kinds of birds of the southeastern states feed upon boll weevils.

Three men in Brooklyn, New York, who have not qualified for a license to practice medicine are said to practice on the licenses of physicians who have either retired or died. It is not known how the licenses fell into their hands.

A six weeks' course for prospective bridegrooms is given at the Central Y. M. C. A. in Brooklyn. The course takes the form of lectures covering all aspects of married life, from the parts to be played by the relatives to the proper ages at which to marry and the sort of wife to choose.

Protracted researches into the nature of the Aurora Borealis, known as the "Northern Lights," lead Professor Vegard of Christiania University to believe that its essential character is nitrogen, and say that the green line which is the chief feature of it consists of small particles of frozen nitrogen in the highest part of the atmosphere. This line appears when frozen nitrogen is exposed to electric rays.

A signature book containing signatures of parents, guardians and others is used by a teacher of the Porterville, California, high school. It is proving to be a terror to those students who would play hookey and write their own excuses.

German troops in the World War failed to reach Amiens in March, 1918, because the soldiers discovered large stores of red wine whose demoralizing effect on the exhausted German soldiers prevented their attaining their objective, according to a German professor, writing in the German temperance periodical, the *Christian Advocate*.

Utilizers of electric-light poles in California find it necessary, in many instances, to impregnate the entire pole with creosote to prevent serious damage by termites to the tops and cross arms.

An authentic Titian, owned for many years by an artist who never suspected its worth, has been sold to a Los Angeles art collector for $100,000. The artist who sold it bought it at an auction in Florence, Italy, while he was studying art there in his youth. He paid the equivalent of $150 in American money for the masterpiece.

The originals of the Declaration of Independence and the Constitution have been placed on public view in a specially constructed shrine in the Library of Congress where they may be viewed by the general public. The shrine is of marble and the papers are in cases covered with specially prepared gelatine films to exclude all light rays that might fade the historic documents.

Upon the advice of physicians Albert B. Fall does not read newspapers and sees only close friends. He is in seclusion on his ranch home at Three Rivers, New Mexico, where he intends taking a long rest.

A priest and editor of the local newspaper in Sondrio, Italy, has been challenged to a duel by a Fascist secretary because of the fact that the editor-priest treated humorously the war decorations of the Fascist candidate for the House of Deputies from that district.

What is believed to be a moccasin print on rock has been found in Virginia on Bolecamp Creek. The rock is flat and level, approximately eight or ten feet in dimension. The track is about six or seven shoe size and represents the right foot. A rim about the edges of the track would indicate pressure of the foot before the hardening had taken place.

It has been charged in the French Chamber of Deputies that of 85,000,000,000 francs paid in claims for war damages, only 15,000,000,000 went into the pockets of the genuine victims of the war.

CHRONICLER OF THE NEGLECTED TRUTH

Heart of English Newspaper Is Editorial Page

An Interesting Survey of News and Ad Contents of Britain's Great Dailies

By GAIUS GLENN ATKINS

TEN days at sea, even with a wireless, is a considerable detachment from the going concerns of the world. True enough, a ship is a world of her own which sea and sky conspire to isolate, with rumors running up and down her decks and a disconcerting likeness to the world as it is, stokers feeding her furnaces in the deep inwards of her, third-class passengers out on the lower decks when the weather is kind, and up in the sunlight a first-class list as comfortable as the sea permits, with officers who do not take the passengers into their confidence and a road to follow where only sun and stars are certain guides. For the time, nothing much matters but making the day's run and those who bet on it taking chances against cosmic forces. The principle upon which the radio news is chosen passes intelligent comprehension—only stock market quotations and the trivial seem to be caught out of blue or gray emptiness. Perhaps the immensity of the sea makes it all trivial.

But the first sight of land brings the world back again and the French boys who sell you *Le Matin* or the *Echo de Paris* or the Paris edition of the New York *Herald* at Cherbourg are liaison officers giving you a chance to try your rusty French, change a shilling into sous, and touch the world again. I chose the *Echo de Paris,* a four-page sheet badly printed on poor paper with tabloid news, little advertising and a pungent indictment of English policies, significant of the breaking Entente. Southampton gives you the English press and unless you insist on the London edition of the New York *Herald* or the Chicago *Tribune,* or spend your time reading three-weeks-old American journals in the reading room of the American Express Company, you see the world thereafter as long as you are in England through English eyes.

A course in English newspapers is an experience worth consideration, and after reading them for weeks I brought them home, half a trunkful. They have been piled up for months at arm's reach and I take the one on the top: the *Daily Telegraph,* late edition, eighteen pages, price twopence (four cents); published in Fleet Street and postpaid in England four pounds and eleven shillings a year in advance, twenty dollars say—not cheap. It is a stodgy sheet, eighteen inches wide, two feet two inches long with twenty-four inch editorials as the heart of it, printed on a tougher paper with less glaze than the average American journal; both inside pages, close-line advertising, beginning with births, marriages and deaths, two and six (say fifty cents) a line—notices must be authenticated. If you are reported dead in the *Telegraph* you must prove it. Personals follow with legal and probate notices, bids for supplies, shipping and mails, schools and tutors, horses, cattle and carriages for sale, motor ads (negligible), horses a-plenty, from cart horses to Irish hunters—a close-packed page and no nonsense. Back page: situations (one shilling to the line), auction sales and more motor cars. First inside page: money and financial shipping and trade with substantial reports of United States trade and markets. Third inside page: shipping again, lawn tennis, yachting, the army and navy and a little advertising. Fourth inside page: sport entirely, carefully and soberly reported, a marked absence of slang or smart writing. Headlines small and businesslike. Next page: engineering notes and technical articles; principal article, a study of steam road tractors, much seen in England. A serial novel takes more space than any first-class American daily would give. There are few specials. A Bishop has been protesting against too ardent love making in Hyde Park; a special correspondent has been studying the situation and finds nothing worse than a stolen kiss—loss not reported to the police—which he thinks "should not bring a blush to the cheek of the ordinary observer"; an American writes at length on the Bishop's charge and says we have as bad at home. A column of American news from our special correspondent, well written and fair-minded; conditions at Ellis Island, the coal strike, transatlantic travel, the funeral of a Russian princess, and Jack Dempsey and Siki furnish the items.

Editorial Page the Heart

THE heart of the paper is editorial, political and international, and here there is an amazing force and range. A "leader" on Italy and Greece; a second on the Free State elections; a third on the Wrangel Island tragedy, all carefully argued, analytical, restrained—a general characteristic of English newspaper writing. Theater advertisements flank the editorials. The king and court figure on this page.

But the arresting thing is the foreign correspondence. This reflects England's far-flung interests and her cosmopolitan mind. The same situation is reported by special correspondents and diplomatic correspondents. Nothing of Europe is left out and little of the seven seas. In this the better English newspapers contribute to a world-view intelligence which the average American —as far as he depends on his press—simply cannot get. The index of the *Telegraph* is revealing. Six main heads: "Official," "Abroad," "Home," "Sport," "Finance and Commerce," "Advertisements." "Home" and "Sport" have the most items, but "Abroad" has the largest single space—fifteen columns as against thirteen for "Sport," almost one-quarter the news space of the paper. There are no "scare" headlines, no two-color printing, no "comics," no "stories," no sex appeal, no bandits and no divorce accounts though when an English newspaper does publish divorce proceedings the thing is done with English thoroughness and no detail of co-respondence is omitted, though, to do them justice, they put it in the finest of fine print.

The *Telegraph* is one of the great morning dailies, founded in 1855; a middle-class organ, judiciously conservative and just now pro-government. I find a great many *Telegraphs* in the pile at my elbow; the issues changed in detail but not in substance. A paper needing thoughtful readers with time to read it. It crackles as you fold it and you can hear it crackling in the less exclusive clubs, second-class railway carriages and in front of the grate after tea. An Englishman generally treats his newspaper with care; folding it is a ritual. An English friend once told me he could judge a man's character by watching him fold his papers.

The *Times* comes next—any issue—September 6 will do. Same width as the *Telegraph,* two inches shorter and the same price, twenty pages, perhaps a trifle better paper. The first page, solid line advertisements. The *Times* is nothing if not logical: its advertisements begin with "Births," good, select, high-class births at a guinea for three lines or less and five shillings for every additional seven words—Limehouse does not report its births in the *Times.* R. H. C. Amos announces twins, a clear saving of a guinea. Marriages follow Births, Deaths follow Marriages—a dramatic foreshortening of life—and "In Memoriam" follows Deaths. In Memoriams cost "three and six" a line, not too dear for considerable poetry. These notices are anniversary tributes generally, pathetic echoes of the war. For example: "In proud and loving memory of Major Henry Griffith Boone, D. S. O., R. F. A., who died of wounds at Ypres, September 6th, 1917." There are many such; a shining list.

"Personals" of the Times

"PERSONALS" come next at ten shillings two line minimum, and five shillings a line thereafter. It costs S. C. $2.30 to ask L. R. to "wake up and do something for me," or "Kit" to tell A. B. that she—it must be a she—is "desperately anxious." The personal columns in the *Times* are a fascinating human document; you are offered anything from shooting places to tears. Club announcements, dancing, business offers, investments and loans, legal notices, domestic situations fill the rest of the page. The charges vary but four shillings for four lines is the minimum. There are about 1,750 lines on the page which average four shillings—ninety-two cents—the line, say $1,500 the page. This issue carries fifty-two columns of advertising, seven and a half pages out of twenty. The back page is all real estate advertisements—but what real estate! History, luxury and sport, with a good bit of agriculture, all on the block. Here is Gelston Castle, two and a half miles from Castle Douglas, with salmon fishing in the River Dee and the farms of Castle Gower, Breoch, Beveland and Kirkland. It would be worth bidding on that estate just to own the names in fee simple.

The *Times* has always put a generous amount of possibly the most valuable newspaper space in the world at the disposal of its readers. Writing to the *Times* is a historic safeguard of British rights and, in cases of undue irritation, a substitute for old-time blood letting which was supposed to prevent apoplexy. In this issue Colonel A. K. Wyllie warns invalids and a sensitive public generally to avoid Brighton because of the "intolerable nuisance" of motor cyclists. He has had two interviews with the "chief constable" which "while my reception was both cordial and sympathetic, have produced no appreciable result." Mr. Challoner, of the Northern Counties' Club, London, indulges in a mellow reminiscence of a sixty-mile walk he did in 1876 with three friends. Mr. Taylour protests against the slaughter of Canadian bison. The Rev. Dr. A. E. Simpson replies with some heat to a criticism upon some restorations he has been making in his church; said critic, he is persuaded, "evidently cherishes the curious ideal of those times which was to make our ancient churches look like cold corpses." A plain spoken man, Dr. Simpson. "Letters to the *Times*" have made history: Thomas Carlyle in 1870 wrote one letter which solidified English neutrality in the Franco-Prussian War; the history of the last sixty years might possibly have been changed had that letter never been written.

The great English newspapers print their editorials at the heart of the paper—the reason being that the reader is supposed to open at once to that page—and the editorial page of the *Times* has been for one hundred and forty years a compelling and often a determining force in English politics. The *Times* was founded in 1785 by John Walters, a fearless and telling middle-class protest against the harsh policies of Pitt. Walters was more than once fined and imprisoned for his writings and only escaped sharing the pillory with DeFoe. He was a born newspaperman. He knew the value of a "scoop" and organized a news agency which again and again beat the government messengers. He sent out the first war correspondent and was the earliest to announce the battle of Waterloo. His son, John Walter the second, consolidated and extended what his father began. He divided the management and the editorial office and began the great editorial line which has distinguished that paper.

Edmund Stirling won for the paper its name, the "Thunderer," and Delane followed Stirling. John Walter the third succeeded the second Walter and the *Times* held its place though other papers, the *Telegraph* and *Post* outstandingly, copied its methods and divided its field. In 1908 the *Times* was taken over by the Times Publishing Company with a capital of 750,000 pounds (its circulation at that time was less than 30,000). Harmsworth—Lord Northcliffe—secured, in the next thirteen years, about 300,000 out of 645,000 shares. The "Thunderer" thus became one of the Northcliffe group and Harmsworth used it during the war with telling effect. The paper came, finally, into the control of the self-expatriated American, Astor, and he and Walters have now put the control of it into the hands of trustees who are to administer it as an independent journal. It is generally pro-government but otherwise one of the few English newspapers which does not represent an "interest."

The "leader" in this issue is on Mussolini and Corfu; the second editorial on "Unions and Disputes"; third on "American Competition"—all direct, well written and well argued. During the summer the *Times* carried, and likely carries still, fascinating editorials on a most human variety of subjects, rich in observation, humor, literary touch and recondite allusion, pieces of writing which would lend distinction to any printed page. I note the subjects: "Meals on the Train," "Scent in Flowers," "On Constructive Conservatism," "Before Breakfast," "On Presents of Game," "On Getting Back," "On Getting Up," and a classic "On the Telltale Dog"; half-column gems written by a nameless pen. The foreign and imperial news of the *Times* is in proportion much the same as the *Telegraph* but, I should say, of a higher quality. Much of it written by men who are evidently in close touch with the chancellories of Europe. When one adds to this, art, music, the drama, literature, finance, trade and a wide range of human interest, one has a journal which, if we add to its present force its long history and high tradition, stands in a class by itself, at least by the tests of a classic journalism.

The *Morning Post* crackles with Tory respectability. It is the organ of the Tory "die hards": a sworn foe of Lloyd George and Labor Unions and Bolshevik Russia and Most-Things-As-They-Are, and the joy of the Carleton and Conservative Clubs. It contents itself with twelve and fourteen pages and its sport columns outnumber its foreign correspondence but you may be born in the *Post* at one-third the price in the *Times* and it's good reading for all its Tory stiffness and its despondent editorials on the Penalties of Democracy. It quotes Carlyle approving "the noble in the high place, the ignoble in the low" though what Carlyle would say of the *Post* we shall never know. It is really devout and believes in the "old-time religion" without being too exact in its definitions. It has a column on the "Way of the World" which is good enough, ranging from Omar Khayyam to a robin's song. The "Line o' Type" columnist is not found in the English press but his place is well taken.

The *Post* is older than the Declaration of Independence and formerly had great literary distinction. Coleridge, Southey, Arthur Young and Wordsworth wrote for it and it still keeps high connections. If one adds to the *Times,* the *Telegraph,* the *Post* and the *Manchester Guardian* one has the big four of England; these are all twopenny papers clear of the "Interests" and maintaining tradition against a larger and more driving group called the "halfpenny press" and, by the unreconciled and critical, the "Gutter press," but compared with the like in America the last epithet is ill bestowed.

The Halfpenny Press

THIS list includes the *Daily Mail* (Tory), the *Daily Chronicle* (Lloyd George Liberal), the *Daily News* (Independent Liberal), the *Daily Express* (Tory), the *Westminster Gazette* (Independent Liberal), the *Daily Herald* (Labor). These papers have enormous circulations, the *Daily Mail* 1,750,000, the *Express,* 1,000,000, the *Chronicle* 900,000, and the *News* 700,000. They are from eight to twelve pages and smaller paged than the great dailies. They carry, as most American papers, a main page with featured news; they feature also what the American press calls "stories" and cartoons but no "comics." A keen young reporter on the *Mail* told me he liked the American comics but his paper could not use colored comics because of the mechanical difficulties in printing the enormous issues.

These papers make no specialty of Sunday editions. They stress sport and one of them, the *Star,* features racing and the bookmaker's odds. They follow public opinion, live out of their advertisements, and are, occasionally, as nearly sensational as anything English can be. They are not, however, excessively influenced, so I was told, in their policies by the prejudice or policies of their advertisers.

They are strongly under the influence of the American ideal in composition and reporting. An analysis of their ownership and directing policies reveals in English journalism a movement parallel to syndicate or group ownership in American journalism, for the English press today is largely under group control. The Harmsworth group, the Berry group, the Cadbury group, Rowntree and Lord Beaverbrook are the Hearsts and Munseys of the English newspaper world. The Hulton and Northcliffe interests have recently amalgamated, evoking fresh protests against the process of centralization which, say the pessimists, is taking individual initiative out of English newspaperdom and robbing it of distinction. The careers of some of these more recent owners, particularly the Harmsworths and Beaverbrook, read like a romance. These men have a genius for organization, a flair for the trend of public opinion and an instinct for news values which gives a Napoleonic quality to their enterprises.

These great popular dailies are, by American standards, plainly housed but their working personnel is hard to reach for all that. A "commissionaire" guards the approach and your entry is made by card. Meanwhile you sit in a bare reception room and wait. When you finally reach the editorial rooms you find an atmosphere and setting in which any newspaperman would

"Vetoing Vic" Donahey, Ohio's Fighting Governor

Believes There Are Far Too Many Laws and Feels They Are Made for the "Classes"

By EMERSON ROBINSON

THE HON. A. V. DONAHEY,

Governor of Ohio.

THE governor of Ohio sat in his private office in the statehouse at Columbus late one night. He had a problem to solve and couldn't find the solution. By no combination of figures could he add five and two and get a total of nine, yet that is what an intelligent, adult legislature had decreed in increasing the number of trustees for a state institution.

Therefore the bill got the ax. It was one of seventy-six vetoed by the governor, a record not only for Ohio, but for all other states.

And when he vetoed the last bill, A. Victor Donahey, or just plain Vic as he is officially now, crashed into national prominence and became a possible contender in the Presidential derbies. But Vic isn't interested. He has one job and he hasn't finished it yet. He won't talk to anybody about any other job.

What manner of man is this Donahey, anyhow?

Well, he's as good a printer as ever, in the rush hours of a newspaper composing room, pied an ad.

He's as good a husband as any woman could wish and he's as good a dad and pal as the father of ten living children could have. Therefore he is a good citizen.

He was such a good township clerk and member of the board of education at New Philadelphia, his home town, that he was elected county auditor. They later sent him to Columbus to help draft the new state constitution. That was in 1912.

Then the people of Ohio took a liking to him and elected him state auditor, and he made a good auditor because he worked hard and long and efficiently. Then they made him governor.

The governor has peculiar ideas, that is, peculiar for a man in public life.

Far Too Many Laws, He Says

FOR instance, he believes that there are too many laws and too much lawmaking; that there is excess class legislation and not enough mass legislation, and when he assumed the reins of government in Ohio he announced to the assembly that he would veto every bill passed that was not for the masses and was careful to explain that by masses he meant everybody.

"There is a hysteria of lawmaking in the country," said Governor Donahey. "There seems to be an idea among legislators that every action of mankind should be regulated by law and that every business, large and small, should be controlled. There are entirely too many laws, laws that don't mean anything, laws that are not enforced and not enforceable. A law that isn't enforced should not be on the statute books.

"Then, too, there are so many laws that are mere matters of administration, that they only serve to clutter up the books."

If the governor had his way about it, he probably would eliminate about two-thirds of Ohio's laws and the state would be better off if he could do so.

One bill which he rejected, and which, by the way, the legislature repassed over his veto, was the Taft law, raising the tax maximums throughout Ohio. The state for years has been in a tax muddle. Tax spenders in cities, counties and state, and even on boards of education, have been weeping copiously because they haven't had sufficient funds to carry out ornate plans of improvement and add thereby to the tax burden. The Taft bill may yet be voted on by the people, as a referendum is being discussed.

Governor Donahey has his own idea on tax rates and bond issues. It is unique but he believes that if it were enacted into law, it would forever settle the tax problem in Ohio or any other state which tried it.

His plan is simple—absolute MAJORITY home rule. He doesn't care a rap how high the tax rate in a community is nor how many bonds are issued, provided a majority of the voters in the district give approval. The word majority, as used by the governor, should be explained. He means a majority of the voters qualified and registered to vote at a regular November election. As an example:

Suppose a district has 10,000 voters. A proposal to issue $100,000 in bonds for parks is submitted either at a special or primary or even at the regular election. The majority would have to be 5,001 votes and it would require this number to carry the proposal although only 7,000 went to the polls. One can readily see that it would be a difficult problem for designing politicians or hungry officeholders to put over a bond issue or excessive tax rate.

The great trouble in the past has been that most of the bond issues have been minority-voted. A special election would be called and often not more than fifty or sixty per cent of the voters would turn out, representing largely those personally interested in promoting the proposition and what support they could muster.

The governor's home rule plan would extend even to the method of levying taxes; whether by the uniform rule under which all property is supposed to be taxed at a uniform rate; classification, under which stocks, bonds, and so forth, are taxed at a lower rate than real estate; income, occupation or any other kind; he doesn't care which, so that the people in the district, by majority vote, say they desire that method.

It takes courage to veto an appropriation for an educational institution. The people, generally, are proud of their colleges and their universities and requests for money largely are met by the legislatures. The requests were approved by the assembly, halted for a moment by a characteristic veto of the governor and reinstated by the legislature over the veto. Donahey cut nearly $3,000,000 off the allotment for new buildings.

The bootlegging industry got it in the neck. The Bender bill makes it murder in the second degree for the liquor salesman when a person, as a result of drinking his liquor, dies. The dry enforcement laws are strengthened, and property used for the manufacture of liquor may be "padlocked" for a year. The buyer is equally guilty with the seller.

Then the "dry" interests sponsored a bill which sent violators of prohibition laws, unable to pay fines, to prison. This, the governor believed, would have permitted the rich to escape prison. Here is his veto comment:

"Laws that make a convict of a poor man and permit a rich man to escape with a fine, will not be approved by me so long as I am governor of Ohio."

There was another measure intended, its supporters believed, to strengthen the motion picture censorship law. It did away with the imprisonment feature and increased the fine, the assumption being that it would be more difficult to convict if the penalty carried a prison sentence.

Governor Donahey believed the bill weakened the censorship law. Here's what he said in his veto message:

"I hesitate to afford to unscrupulous exhibitors or purveyors of immoral, indecent or otherwise objectionable films, the opportunity of placing such pictures on exhibition at a huge profit and suffer as a penalty for such infraction of the law a mere fine, easily paid from the profits of such sordid enterprise.

"In my opinion the risk of imprisonment up to one year for flagrant outrage of public decency serves as an emphatic deterrent to those who, not fearing mere fines, might otherwise unhesitatingly seek profit at the expense of public morals.

"Let us safeguard with every precaution the moral atmosphere in which our boys and girls are growing up. Let us shield against every sinister influence or embarrassing contact the innate modesty and purity of our mothers, our wives and our daughters * * * *."

Donahey believes in organizations. They are fine for a community—up to a certain point—but this point, he believes, has been passed in America, which is suffering from over-organization. There are entirely too many clubs, associations and organizations representative of particular businesses, trades or professions, each trying to obtain legislation. Each city and even each village has many such organizations, and every one of them is trying to do something in its own way. Each has its national, state and district representative and each is attempting continually to influence public officials along the path which it desires them to travel. And a good many of these objectives are purely selfish.

Governor Donahey puts it this way:

"There are too many organizations, too many blocs and too many interests, and they are all using whatever pressure they can bring on legislatures and public officials to gain legislation which is largely selfish.

"What the country needs is an organization of the masses, an organization for everybody, rich and poor alike, with no personal axes to grind and with the sole idea of obtaining that which will be of benefit to all the people.

"There is so much lobbying about the legislative halls and so much lobbying even about the governor's office that I am sick of it. Selfishness, selfishness all the time! Why can't somebody do something for the general good?"

What He Holds Greatest Need

AND here is what the governor believes to be the greatest need of the nation today:

Constructive administration in the interest of the masses and laws to put a stop to legalized burglary.

In this latter class he places gambling in the necessities of life, foodstuffs, fuel, cotton, wool, and so forth. He would make the laws so stringent for the speculators who drive up the costs of these, that enforcement would be an easy matter—the gamblers would not take chances on spending long terms in the penitentiary.

And along this same line, the governor already has shown what can be done to protect the people. Ohio is fortunate enough to have a blue-sky law designed to prevent the unloading of worthless stocks on the investing public. It has been on the statute books for years and has been enforced more or less—largely less.

When he was state auditor, Donahey had occasion to observe the workings of this law. He learned that untold millions were being lost yearly despite the state's restrictions. As soon as he became governor with power to investigate the department he did so and with this result:

In less than two months he revoked the right of companies that had sold $118,000,000 worth of stock to continue in business. This stock has never paid a dividend and Donahey has given assurance that not another dollar's worth of stock will be permitted to be sold in Ohio unless investigation shows the project to have the assets claimed and shows further that the business is to be conducted for the benefit and in the interests of the stockholders and not of the promoters. Incidentally it might be stated here that within the last five years, Ohioans have lost more than a hundred million of dollars in worthless stocks.

Why He Won't Take Degree

ALMOST from the day he took office, Governor Donahey has been in a row with his director of highways, Leon C. Herrick, the appointee of a former governor. Donahey has his own ideas on road building; so has Herrick. The governor revoked the right of the director to award contracts without his approval through the director of finance. Herrick awarded the contracts, they were held up and court action to determine the rights of the disputants was filed. The governor lost, and Herrick remains on the job until his term expires. Following the decision of the Supreme Court, Donahey announced that he would never appoint a highway director until he had his signed resignation. Then if the official is recalcitrant, his services can be dispensed with immediately. The governor demanded Herrick's resignation and it was refused.

There is one other element in the make-up of Donahey, the governor, which sets him out as an unusual man. In years gone by one of the chief duties of the governor of Ohio has been to make commencement addresses, speak before forums, chambers of commerce and generally make himself conspicuous about the state. All of which may be perfectly agreeable to a governor, if he has other political aspirations, and to the audiences which take pleasure in meeting the state's chief executive.

But Donahey takes a different attitude. He believes he was elected to serve the people and not to make speeches and galivant about the state day in and day out and week in and week out, repairing political fences or seeking to strengthen those already strong.

He believes he can be a better governor by sticking to the job in his office at Columbus than by waving the flag to get a hurrah; that actions speak louder than words. So despite the fact that he has received hundreds of invitations to banquets and to address varied gatherings, he has turned them all down. He will continue to do so.

He also has the idea, a mistaken idea most politicians would say, that no man is entitled to that which he has not earned. He lives up to this precept as shown in the following: It is the ambition of nearly every man to be honored by a university or college and to be able to tack on to his name an LL.D. or some other degree, whether it means anything or not. Not so long ago, the governor was approached by a representative of a state educational institution with the suggestion that if he make the commencement address he might be awarded such a degree. With characteristic brevity, Donahey replied that he would like to have the degree,

Swift Changes Taking Place in Agriculture

Now Is Time to Get in on Ground Floor of Farm Factory of Tomorrow

By WELLINGTON BRINK

AS I go about my task of gathering information for farm folk, I sometimes stumble across things that cause me to wonder if the great city papers are not, after all, regularly passing up the biggest news story of the day. In no other branch of life are such swift and portentous changes taking place as in agriculture.

As an illustration—

I travel to a small town, hunt up the courthouse, buttonhole a man who looks as if he might be leading citizen, mayor, judge, Congressman, bootlegger, police chief or someone, and inquire: "Can you tell me where I can find 'Cy,' the spectacled farmer who is so popular with the cartoonists? I suspect he's the old boy I'm looking for."

"I am sorry, sir, but I cannot give you the present address of any person named 'Cy,'" says he, civilly enough. "'Cy,' I understand, shaved and began talking civilized American some time ago. Furthermore, he now goes by the name of Simon or Sebastian or Sidney. And who, may I ask, do you happen to be, young fellow?"

"Oh, I'm the scribbler who is to cover the county fair."

"Well," he exclaims, in sudden recognition. "Shake! I'm Tim Brown, president of our fair association. To be cruelly frank with you, we were ah - er - expecting some such journalist as we see pictured in the movies —somewhat obese, you know, middle age, shaggy crop of whiskers, lots of dignity and all that. But then, you may be all right, after all. You never can tell, in these days of kid wonders and topsy-turvy farming."

As I leave Tim Brown I write in my mental notebook: "Editors and farmers are not running true to traditional form; at least one editor I know is beardless and skinny, and at least one farmer is big and pompous and sophisticated."

Out on the street, I purchase a pink edition of the town's newspaper, and there on the first page is a dispatch heralding science's latest reputed achievement—the duplication of an egg yolk. The article fails to mention whether science patterned its work after the Brown Leghorn or the White Wyandotte. And it neglects to include science's prophecy as to whether the orphan chick-to-be will grow feathers or hair or steel bristles. But from a news standpoint this is immaterial, anyway, although the commercial possibilities are enormous.

The New Agriculture

ON THE train carrying me back to headquarters I buy a green "extra" and finally discover a "stick" of real "dope" down in the lower left-hand corner. A university professor, it seems, has assumed the cloak of "rainmaker"; he is playing an old-as-the-ages rôle but has an entirely new bit of action. Instead of exploding gunpowder or conducting mystic rites or chanting strange words, this learned gentleman flies an airplane above the clouds and scatters finely ground, electrically charged sand. Rain, supposedly, follows immediately. Inasmuch as Uncle Sam has been playing opposite this star of science, we cannot doubt the correctness of the theory, nor can we deny its practical possibilities in the realm of farming.

When I reach the office, I plump down in the swivel chair—and as quickly rise up. I find that I have sat upon what used to be a box of candy made from the new rice "milk." I fall to wondering if the same methods used in removing Jersey milk stains from trousers will prove equally efficacious with respect to damage wrought by the Blue Rose or Honduras or Prolific varieties of fluid. And, say,—here are animal and plant shaking hands, as it were, in bonds of comradeship, drawn together by participation in a mutual occupation, functioning, whether they realize it or not, in like capacities.

Presently my editorial neighbor remarks, from behind an ambush of exchanges, "Whatcha know about this?"

The "this" is a story to the effect that of 5,376 school children of St. Louis who were questioned on the matter, 40 per cent have never seen a sheep, 17 per cent have never seen a mule, and 12 per cent have never seen a cow.

"Humph," say I. "And what's more, if it were possible for the present trend to continue indefinitely, the time would come when all we'd have to show 'em would be mechanical sheep and mules and cows. Live stock would become as extinct as the American bison.

Hard as it is to believe, on one of my recent trips into the country, I discerned unmistakable traces of culture. It may not have been either Bostonese or Pekinese, but it was genuine bottled-in-bond, nevertheless. Those poor "jakes" knew more about Mendel's law and Centre College football and Coué than any bold Easterner of my acquaintance.

That was the same trip on which I made the startling discovery that many of the best farms are being manned by young men just out of college, youngsters who had been reared in the city. They were clearly outdoing many an old-timer in the growing of corn and spuds and cabbages. It would seem as if my friend Tim were indeed right. Agriculture *is* topsy-turvy.

Why, here just a day or two ago, I was in the ill-smelling laboratory of a state experiment station talking with a chemistry genius of the new type. I received positive evidence of his ability—borne out by previous demonstration—to estimate crop yields accurately by soil analyses and a squint or two at geological and climatological charts.

All of these editorial adventures—all of these casual "pick ups"—are mere isolated incidents of a life skirted with rural phenomena of increasing significance and multiplying numbers. I am fully aware that they constitute the rankest sort of heresy, that they break down our most cherished preconceptions, that they utterly smash tradition. They are iconoclastic in effect, jarring down from the walls the pretty pictures that have been hanging in the halls of public fancy for lo! these many years.

The things I see are off-stage glimpses by a privileged reporter. They lead me to believe that, notwithstanding the rapt attention being bestowed upon Miss Radio and Dippy Aircraft and Sammy Submarine, the biggest act of all is waiting in the wings. This act is billed as "The New Agriculture." And it is safe to say that the effect of this headliner on the world audience will be more impressive than that achieved by any of the favorites that are now momentarily in the spotlight.

Some of the front-row brethren are of hearty imagination and ready prognostication. Already they are clapping their hands in anticipatory applause. They hold the vision of a highly profitable agriculture conducted on a system of convenient electric switches and pushbuttons. When their dream comes true—so they reason—it will be the proper thing for them to move to the country!

I dislike to disappoint. Fidelity to the coming agriculture, however, prompts me to suggest that farming is still going to depend somewhat upon the air and the sun and the rainfall—but hardly more than does the Stock Exchange under the present status of affairs. Indeed, hardly as much. Under the new order of things, the highly trained specialist will know how to manipulate the elements to his continuous advantage, just as the skillful bear or bull of Wall Street successfully responds to the fluctuations caused by war, weevil, weather or Washington. He will apply to every branch of his business the same precision and efficiency that enables the Danish farmer of today to compute, from a glance at his records, the exact amount and value of milk that will be lost every five minutes that Bossy is permitted to face a "norther" with her blanket off.

The periodicals of our country are heavily laden these days with the inspiring stories of inventive geniuses who have converted their brain energies into gold eagles, of men of small means who, by an investment at the right time, have ridden to fame and fortune on the crest of an industrial wave. Thousands of "success" stories have been built about young men and young women who have chosen an "oil" career or an "automobile" career or a banking career at precisely the strategic moment.

Now, I'll venture to say that no "success" story of this type has ever seen its beginning and its end on a farm. Millions of husbandmen have lived lives of undisputed service, supplying food and fiber for humanity, yet they have died unknown and unsung. A few small fortunes have been garnered from specially favored herds or crops. Nothing, however, comparable to the meteoric ascensions of some of our financial and industrial barons has ever attended a strictly agricultural enterprise.

But take a tip from me: If you have the brains and stamina and ambition, now is the time to get in on the ground floor of the biggest thing of all time! People can let their hats go unblocked and their shoes unshined. They can let cobwebs grow over the entrance of the movie show. They can forget their ice cream sodas and shaves and after-dinner cigars. They can let politics and baseball rest. They can even stay away from lodge. They can draw out the last penny of their savings. But two things are necessary: They *must* have something to eat and they *must* have something to wear. With increased populations, higher standards of living and the exercising of more discrimination, the demand for high-quality staples is mounting at a bewildering rate.

"Back to Farm" Wrong

THIS increasing consumption is proceeding in the face of a decreasing proportion of ruralists. In 1820, 87.1 per cent of the people of the United States were engaged in agriculture; in 1920 only 28 per cent were so occupied. Hence, the professed alarm of the newspapers over this "shocking" drift toward cities and towns. "Something must be done to stem this movement—and that immediately," they cry. "Congress must pass some resolutions and appropriations and credit measures."

It seems to me, however, as I scan the latest Yearbook of the Federal Department of Agriculture, that there is being made much ado about nothing. Headlines, too, continue to proclaim bumper crops. Statistics prove beyond challenge that we are producing in larger quantities and of better qualities than ever before. Modern equipment and increased ability are more than taking care of the loss in man labor.

What is really taking place, I think, is a sort of general house cleaning. It is a dusting and scrubbing preparatory to the methodical industrializing of agriculture. And if there is anything temporarily harassing, it is that rural America is threatened with a brain-famine. Many of the more intelligent pupils of the old school of farmers are getting cold feet over the present market schedules of farm products and are fleeing to the cities where they are assured for the time being of better wages. The counter-movement of agricultural industrialists is not yet fully under way, but it is taking form.

"Back to the farm"—phonetically speaking—is pleasant enough, but as a practical slogan it is all wrong.

Why should we wish to persuade back to the farm men and women who can do better in the city? Why should we urge a repetition of past failures? What rural life most needs is a strong injection of new blood, new ideas, new viewpoints, new confidence, and new force. What America needs is not *more* farmers but *better* farmers. And the *better* farmers of the day that is dawning are to be square men and square women fitting snugly in the square holes of the new industrial organization, the new economic system and the new business philosophy.

Out on the farms are thousands of misfits and discontents. In the cities, towns and villages are thousands of other misfits and discontents. It is time for many members of the two groups to swap places!

At the present writing the nation is somewhat "bearish" on the rural districts. The farmer's situation, it is said, is not an enviable one. His plight is day by day getting worse and worse, and worse and worse. But the fellows who are keeping quiet are those who don't consider their "plight" or their "situation" and who don't take the time to view themselves in mirrors. They are the forerunners of the new order of affairs. They are the advance engineers preparing the way for the march of the relief army of agricultural workers.

Science Cuts Labors

THE plowman of yesterday would scarcely recognize the furrow of today. Science is cutting strange capers. It is slowly but ceaselessly reducing the amount of horse labor, mule labor, man labor. Tractors, trucks, harvesters, implements of all sorts—iron men and iron mules—are taking over the work, doing it twice as well and many times as quickly. Farm women are being brought in from their manual work in the fields, and returned to their heritage of homes and happiness. It is the *country* sweatshop that now is doomed! The greatest factory of all—the food factory—is at last about to be put on an efficiency basis; the machinery is being installed and the call is going out for highly trained specialists as operators—men who understand the new process of manufacture or who are temperamentally and otherwise adapted to becoming apprentices in the greatest enterprise of the age.

In response to the call, 51 state institutions of higher learning and innumerable elementary schools are training a new generation of farmers alongside the latest generation of engineers. Texas cowboys are coming off the range, wearing their chaps to college, learning the scientific secrets of ranch management. Kansas plainsmen are spitting the sand from their teeth and riding their little pintos to school, where they are to study the problem of keeping their crops from blowing into the next county.

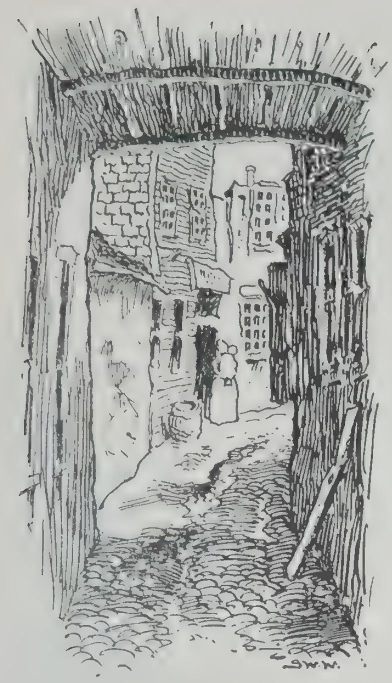
And what are they learning? Why, machinery, genetics, plant and animal breeding, balanced rations, geology, chemistry, physics, agricultural engineering, economics, sociology, and business administration; they are learning the most complicated vocation in the world, agriculture. They are treating agriculture as an exact science, and they are making progress as if endowed with seven-league boots.

These are the ones who will be the executives, administrators, "training officers" if you please, of the new army of food and fiber manufacturers. And in the ranks will be the stalwart men and women who have lived their lives on the farm, keeping step with the march of progress; the boys and girls farm-born and with the spirit of militant, aggressive agriculture coursing in their veins; and, lastly, the vast rank and file of "apprentices" or buck privates who formerly were soda-water jerkers, or barbers or motormen or school teachers or shoe clerks.

It will not be many years before the farm organization will be holding its production strictly to a basis of advance orders, just as the manufacturer of safety razor blades or shoes or soda sirups or street cars adjusts his factory output to the anticipated demand. And in that day the instructions of the farm superintendent for the production of so many bales of cotton and so few bushels of corn will be met with harvests closely approximating the stipulated amounts. A nearly perfected science and a highly competent personnel will do the job.

It is not my purpose to "promote" this promising industry—The New Agriculture. As I have already intimated, it is not *more* farmers but *better* ones that are needed. But if I were to be commissioned by Ma Nature to look after her publicity of the next 50 years, I'd start right now. I'd pick out the brightest young city chap I could find and the most promising youth of Rural Route No. 1, and this is what I'd tell them, *in confidence,* you understand, according to the prescribed formula, but at the same time with the strength of pure motive and honest conviction:

"Take a tip from me, Old Top, and subscribe for a chunk of stock in the new issue of Agriculture, Amalgamated! Take out 10 acres and copy-cat the larger operators. Or merely invest your health, ambition and brain for the next few years. Remember, the big boys today are the ones who got in on the ground floor when they were young."



Salt Lane.

Old Boston Lanes Richly Steeped in History of City's Colonial Days

Queer Highways and Byways of New England Metropolis

By MAY B. WHITING

STREETS and avenues at right angles, all neatly numbered and as alike as peas in a pod, may be convenient and beautiful in a conventional sort of a way, but a Bostonian loves his alleys and his lanes. Their quaintness, their dinginess, and their mystery, too, for even the initiated cannot be *just* sure where they all lead, stir the imagination, and their names alone suggest episodes of a long and storied past.

When the settlers arrived in Boston they picked out the probable center of the town with such good judgment that the first lane their feet trod remains a much-used passage in the very heart of the business district. It led to the Great Spring which the colonists early fenced about and called the approach to it Springate. Governor Endicott, that flaming spirit, dwelt beside it, and almost across the way lived Anne Hutchinson, a thorn in the flesh of established Puritanism. In the neighborhood were erected the church, the school, and the townhouse. and in back were the docks and tavern by "Mackril Lane," now Kilby street.

The grassy lawns and the peaks of Trimountain rising above them are long since gone, but a tablet marks the spot where the spring bubbled forth which for more than two hundred years supplied the town with water. In 1869, when the foundations for the post office were laid, its sources were disturbed and it gushed to the surface again, much to the annoyance of the workmen. Today Spring Lane is a sort of canyon, offering a welcome relief to pedestrians in the "most congested district in the world."

Several other of these early lanes remain in the center of the city, but none are quite so ancient. Directly opposite City Hall is Province street, a narrow, Old World way, with sidewalks perhaps a foot and a half wide which serve only as a place of refuge when a truck ventures through. Formerly this highway was Province Lane, then Governors Alley. It ran in back of the residence of the royal governors, the Province House, the three remaining walls of which were demolished only last year, revealing unexpected remains of the old mansion, its fireplace, windows, and innumerable molded brick that formed its decoration. Just a little back from Province Lane was the French Huguenot Church, and from it, on the right, led Cobblers Lane, now Harvard Place. This is one of the few squares remaining which one enters by a flight of stone steps beneath an iron gateway.

A little farther down town, leading from Court street to Washington, is Wilson's Court, named in honor of the crier who for fifty years called through the streets of the town the daily happenings, the arrival of a shipload of delicacies from the East, an auction sale of household goods, announcement of strayed animals, or lost children. The Bell in Hand Tavern formerly stood in this court and its old sign, that of a hand clutching a bell, was one of the picturesque features of the neighborhood. Now the place is generally known as "Pie Alley," and it is a convenient passage for policemen, lawyers, and reporters. Many of the streets in the vicinity started life as lanes, some have been widened and others dignified by more pretentious names than their dimensions warrant. Boylston street was Frog Lane, Summer street, Seven Star Lane, while Corn Court was a "wheelbarrow way full five feet wide."

The North End, so called from earliest days, has seen very few changes in its highways. Hancock street, once Orange Tree Lane, is now a generous thoroughfare and from it, every few rods, lead lanes and alleys that once passed the homes of prosperous merchants.

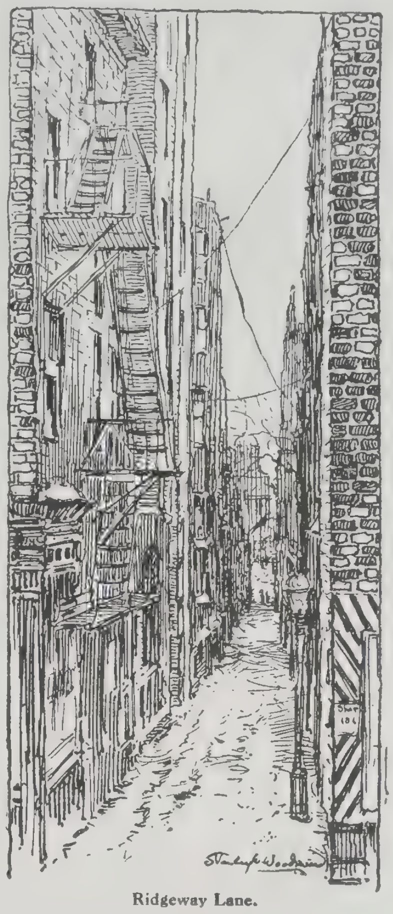
One of the most interesting sections, historically, in Boston, is in the vicinity of Marshall's Lane, where it joins Union, near Hanover. Marshall was a selectman, and a deacon in the church, and the lane was laid out in 1652, a "hieway through his grounds." At the corner of this lane and Union street is a low brick building where Count Rumford, then young Benjamin Thompson of Woburn, was apprenticed to Hopestill Capen, and sold imported finery to the Provincial gentry. Thompson turned Royalist during the Revolution, and later entered the service of the Elector of Bavaria by whom he was made Count of the Holy Roman Empire, taking the name of the New Hampshire village where he once lived. His brilliant career as statesman, scientist, and inventor is barely touched upon by our histories, but the "Rumford roaster" was long a favorite with housewives. In this same building was published in 1771 *The Massachusetts Spy*, a paper whose columns were "open to all parties but influenced by none." Nevertheless its owner, Isaiah Thomas, thought it wise to remove to Cambridge and later to Worcester during the siege.

Marshall's Lane runs into Creek Lane which led to the Mill Bridge across the Pond. On the corner is still standing the time-worn brick building which was once the home of Ebenezer Hancock, younger brother of John Hancock and paymaster in the Revolution. To this house the admiral of the French fleet brought money to pay the Continental army, and the sight of a room piled half full of silver crowns did much to reassure the weary troops. The lower floor of this building is now an "Oyster House," the last of a long line, for in Provincial days the whole town came to the North End for its oysters.

Across from the Hancock house, set into the wall of the building just above its foundation, is the so-called Boston Stone. This was probably the grinder of an old paint mill brought from England before 1700 and used by Tom Child. Under the date November 10, 1706, Judge Sewall writes in his diary,

"Tom Child had often painted Death
But never to the life before,
Doing it now, he's out of Breath,
He paints it once and paints no more."

In 1737 this stone, together with a part of the trough, was set in the wall of a house, the date carved upon it with the words "Boston Stone," probably in imitation of London Stone which is a Roman milestone in front of Saint Swithin's Church in London.



Ridgeway Lane.

Over his shop Tom Child hung the Painters arms, a fine wood carving brought from England in 1692. These arms were granted to the painters of London in 1486, and to his copy Tom Child added his initials and those of his wife beneath the Latin motto, "Love and Obedience." The modern building which occupies the site of the shop bears on its front a copy of the arms, carved in stone.

Creek Lane runs into Creek Square, and only a stone's throw away is Salt Lane, one of the dingiest and most disreputable in the city. This whole section has an Old World appearance like some of the most ill-favored parts of London, or even the Ghetto in Rome, and it needs a Dickens to describe its picturesqueness, not unmixed with squalor. On Creek Lane, John Hancock had his warehouse, and there still remains a part of the row of brick houses built by the first governor and known as Hancock Row.

Just beyond Creek Square were the wharves. On Prince street, then Black Horse Lane, lived the Thoreau family, in business on Long Wharf, and here the father of the naturalist passed his boyhood. To a house on this street Major Pitcairn was brought after the battle of Bunker Hill. General Gage sent a surgeon to attend him, but Pitcairn, feeling that his wound was mortal, asked only to be left alone. In 1786, when the first bridge was built across the Charles, this lane was widened to receive the traffic which had formerly come over the "Neck."

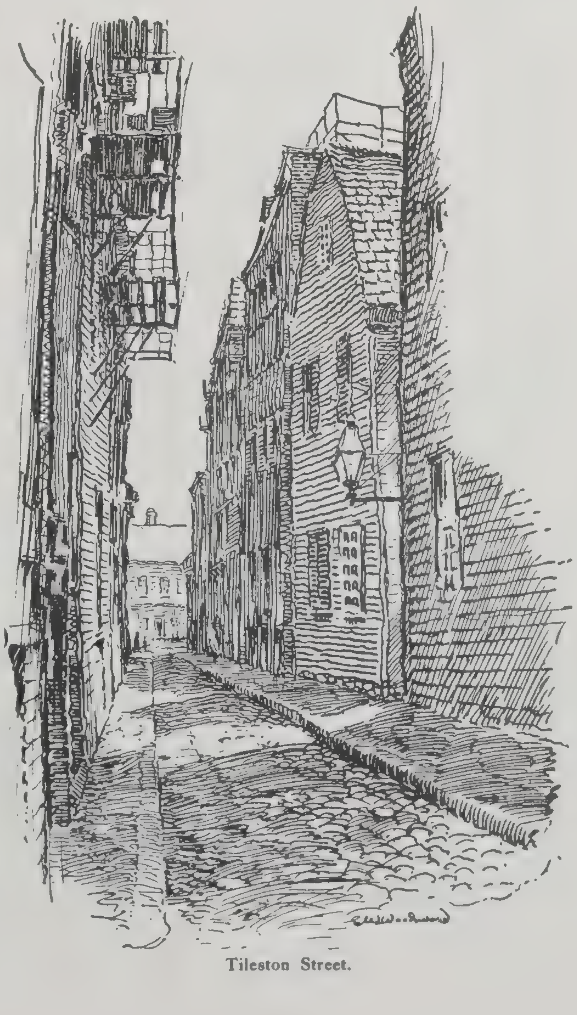
Continuing down Hancock street, we come to many another lane of colonial days, although not all have retained their original names. Tileston street was originally Love Lane, then North Writing School street. In 1786 a free writing school was established, taking in an older school given by Thomas Hutchinson, father of the governor, which had been closed during the siege. One of Boston's famous schoolmasters, "Johnny" Tileston, taught there. Writing was the principal subject and the clear hand which appears in the documents of the time justifies his title of "father of good penmanship." For full eighty years he was connected with the school as usher, teacher, and emeritus, and for more than fifty years he lived in the neighborhood, an eccentric, but beloved figure, clinging to the old attire when almost everyone else had discarded it.

Not far from Tileston street is Wesley Place, recalling the fact that the Methodists had their first meetings near by, and a few steps beyond is North Bennet street, laid out in 1696 as twenty-four feet between the house of Increase Mather and of Bennet, "yoeman." Today the North Bennet Street Industrial School is famous in the educational world, for it was the first institution to teach manual training. To step into this building from the din of streets which are now Italian quarters and to find on every hand rare tapestry, medieval wood carvings, and choice statuary, gives a distinct thrill.

One of the most picturesque lanes, and certainly one of the dingiest, is Salutation street, laid out in 1693 as Salutation Alley, and named from the tavern in it, the sign of which represented two wayfarers doffing their hats with elaborate ceremony. They were called the Two Palaverers by the North Enders, and that was the name the tavern generally went by. This tavern played an important part in Revolutionary days. It was the resort of the mechanics, especially the shipbuilders, and, while it was before the days of "blocs," their vote was an important one, and Otis, Hancock, and Adams took no little pains to win it. Hence comes our word caucus, or "corcus," a meeting of the caulkers.

As Salutation Tavern was the rendezvous of the mechanics, so the Green Dragon on Union street (laid out in 1636 as Goodman Watson's Lane, and renamed in honor of the union of the British Empire) was that of the gentry. Here many of those events which preceded the outbreak of the Revolution were planned. In 1765 the tavern became the property of Saint Andrews Lodge of Freemasons and in 1769 the first Grand Lodge of the province, with Dr. Joseph Warren as grand master, was organized. The books of the years following make interesting reading. On the night of December 16, 1773, the evening of the Boston Tea Party, the record states, "No business transacted, too few brethren present."

In the West End and over Beacon Hill are many lanes of the Old Town, not with the historical interest of those in the center and in the North End, but with a real beauty impossible with the changing population and business conditions of other parts of the city. Ridgeway Lane, laid out in 1789, leading from the back of the State House to Cambridge street, has a charming vista of the Old West Church, and crisscrossing up and down the Hill are tiny streets with colonial doorways and diminutive walled gardens where bloom the first crocuses of spring. Perhaps they lead by unexpected courts with potted trees and window boxes or into little squares with shady grassplots and glimpses of Charles River, silvery in the sunlight.



Tileston Street.

Czechs and Germans Work Out Co-op Problem

Farmers' Societies and Consumers' Organizations Work Harmoniously; Virility of Great Economic Movement Is Shown in Growth in Germany

By HUSTON THOMPSON

CZECHO-SLOVAKIA is perhaps the busiest nation in Europe today. Although it has troubled Poland on the north and Germany to the west, it is busy constructing a nation with a vigor that reminds one of life in the United States.

I had my first glimpse of this country in the early morning after having passed the Polish boundary line. It recalled in a measure the view of the Rocky Mountains one gets in Colorado when the mountains come into view. The fields, green with beet tops also suggest Colorado. This little country produces more than 662,000 tons of beet sugar yearly and its capital, Prague, is one of the world's sugar markets.

One cannot but be impressed with the splendid forests of the mountainous country. One-third of all the land is covered with trees. These forests have been taken over and nationalized by the government. I presume that eventually they will be farmed out to private individuals and crops taken off in somewhat the same way as in Denmark where co-operative organizations do much of the lumbering.

The trip round its capital at Prague immediately impresses one with the industrial activities of that city. They include seventy-four per cent of all the manufactures which belonged to Austria previous to the war. Among these are the coal and ore mining in Silesia.

In most of the countries of Europe I found it very difficult to get in touch with business men before ten o'clock. At Prague on the first morning at about seven-thirty I discovered that crowds of people had arrived on suburban trains and were hurrying from the station to their daily tasks. On inquiry I learned that practically all offices were opened at eight o'clock. Czecho-Slovakia today spells life and energy, with an intelligent populace that is inspired with high hopes for the future.

Unemployment Does Harm

THE degree of intelligence of the Bohemians is evidenced in many ways. For example, one Sunday morning I was visiting the various churches, when I saw a crowd of several hundred persons of the middle and artisan classes gathered about a speaker. His audience was apparently completely under his spell. The speaker proved to be a professor of astronomy at the university who was talking on that subject to his audience.

There is nothing that stands in the way of the successful growth of this nation except the unemployment of about two hundred thousand men, due to the fact that it cannot sell its surplus of manufactured goods because of money conditions in Europe. Were the surrounding countries able to purchase their customary normal requirements from Czecho-Slovakia, it would have what we in America call a boom.

In my excursion into the co-operative field I found here, as in Finland and the Baltic provinces, that there was little difficulty in combining the interests of the farmers' producing and selling co-operatives and the Consumers' Co-operatives of the cities and villages. In fact, the Consumers' Co-operatives informed me that they purchased as much of the farmers' produce as was obtainable. Both types of co-operatives belonged to the same national association or union.

In still another respect the consumers' co-operative organization of Czecho-Slovakia is different from that of England. In the latter country, I found a strike of the employes who had united themselves into one great union which felt itself separate and apart from the co-operative organization. In fact, they were striking for higher wages for a like employment than had been agreed to by the trade union representatives.

Plan It as Life Job

NO SUCH trouble appeared on the horizon of the Consumers' Co-operatives in Czecho-Slovakia. They informed me that when a person became an employe his future was so looked after that he usually planned to stay with them the rest of his life.

They are insured by the co-operative organizations and by state insurance, the premiums of which are paid by their employer. They are paid higher wages than private interests pay for the same class of labor. They are protected by a sick benefit fund. The co-operatives even go so far as to pay their income tax. Also all industries are on an eight-hour-day basis. Thus the ties which bind them are many.

The consumers' co-operative societies have helped their members to solve the coal problem just as is being done for the artisans of England and consumers of Southern Sweden by their societies. In Czecho-Slovakia, the Central Society at Prague receives the orders from the local societies scattered through the country. It arranges with the nearest coal-producing company to ship from its mine direct to the local co-operative which distributes to its members.

The co-operative movement has had a great impetus since the war. Including credit, housing, farmers', consumers' and industrial societies, there are at least thirteen thousand societies.

The reason for this impetus was that instead of going on a buyers' strike, as occurred in this country when prices became too high, the people flocked to the Consumers' Co-operatives or established new ones, not as a means of combating profiteers and price-fixers, but of preventing future runaway price markets.

They found that they could go a step further than simply purchasing in wholesale quantities, so they took the offensive against the trusts and combinations and are today manufacturing many necessaries.

Their success has been such that they are expanding their plants with great plans for the future. During my stay in Prague I visited the wholesale plants and the manufactories of the consumers' wholesale society, just a few miles outside the city. There they were bringing in chicory root by the carload and turning it into the manufactured article. They were also making a great deal of grain postum. They used up-to-date machinery for this work, carrying the grain from the cars into the buildings in one continuous process until the final article was turned out. I also saw them making blueing, shoe polish, brooms, and spices. In one building they were roasting coffee and they had reached such a standard of excellence that the government had contracted with them for coffee for the soldiers. All the surplus of flour or grain that the Consumers' Co-operative has left after supplying their own members is sold in the domestic markets or exported. They bought their wheat from the farmers' co-operative societies as well as from private sources. They showed me boxes of tea which they had purchased from the Consumers' Wholesale Co-operative Society in London and repacked and marked for the use of their own societies.

At Gladenau the co-operatives had a flour mill which had practically failed under the management of private parties and had been taken over by the co-operatives. In season they were running it to capacity. I do not recall what that was but of course it was no such plant as one sees in Minneapolis. Much of its machinery was not as up-to-date as it might have been, but considering the losses sustained in the last five years by these artisans, it was making a very creditable showing.

Next to it was as modern a bakery as one can find in America, in a new building, white-tiled inside, with automatic machinery and great attention paid to sanitation. The capacity of this bakery was fifteen thousand loaves of bread a day, all of which was delivered within five hours after being made.

Believe Crisis Impending

THE Consumers' Co-operatives of Czecho-Slovakia are in no sense deceiving themselves as to the situation that confronts them. They believe that a crisis is impending which will be more difficult to solve than any they have ever had to meet, due to the instability of the rates of exchange, and the tariff and customs walls surrounding the contiguous nations. But they are imbued with a cheerfulness and energy that is delightful to behold and have a superb confidence in their ultimate success.

GERMANY

One might well ask why go into Germany to study the co-operative or any other economic movement under such abnormal conditions. I visited that country for two reasons. The first was to determine whether the co-operative movement could survive such a situation and if so what vitality it had left. I was also eager to investigate the method of financing co-operative movements in Germany for it is generally conceded that just as England is the premier in the consumers' co-operative movement of the cities, Denmark in the farmers' agricultural life, and Finland in its general instinct for co-operation, so Germany stands forth as the first to evolve one of the greatest single essentials in the co-operative movement, the way to finance them.

Leaving Czecho-Slovakia with all its evidence of energy, hope and reconstruction, a remarkable contrast presented itself as I entered Germany. There was plenty of activity on the surface, but it was feverish and unnatural.

There was a scarcity of food and the prices were high. The farmers, fearing a drop in the value of the mark, were sending to the city from day to day only as much produce as they were sure they could sell. The proceeds they invested in some useful articles for their farms before another drop in the money market.

There were in Germany on July 27 approximately twelve thousand rural credit societies; three thousand buying and selling associations; 2,198 co-operative dairies, and 5,431 co-operatives selling eggs, vegetables, and so on, or buying electricity for their members. These, of course, do not include many consumers' societies located in the cities and towns of Germany.

In 1922, there was an increase of 2,952 local agricultural societies but at the time of our investigation the number of societies was falling off owing to the overhead cost of administering the affairs of a society. At the same time, however, the number of members was increasing. In the societies, the total number of members in Germany had increased. This showed that they were avoiding the expenses of starting new co-operatives by having the members align themselves with old ones.

Here a new problem had sprung up. The co-operatives discovered that there was such a thing as getting local societies too large for efficiency.

The crops in the country appeared good and the government reports since have sustained this estimate. I would not have it understood that the farmers' co-operative representatives were free from trouble. Those who handle his buying of machinery and fertilizer and sell his produce told me that the constant dropping in the value of money almost drove them frantic particularly where they were buying in quantities things which the farmer needed.

In my investigation it developed that the number of farmers' credit societies were falling off. I inquired the reason for this and was told that it was due to the fact that the farmers having received good prices for their produce did not feel the necessity of using such credit societies. In other words, when prices were good, the number of credit societies was liable to shrink.

There is a feeling of accord between the farmers' agricultural societies and the consumers' societies. In fact the farmers' societies sell direct to the consumers' societies and there is a special committee for bringing together the producers' and consumers' societies.

The National Organization of the farmers have on their program for discussion this year the question of how to meet international trusts. This same thought of meeting international trusts is spreading among the co-operative societies all over Europe.

The leaders of co-operation in Germany do not believe in obtaining political results through a political party of their own.

Would Interest Women

IN GERMANY, there is a sympathetic attitude toward getting the women interested in the co-operative movement. To date they have not broken down the barriers that surround the co-operative offices. There are very few women who hold office.

In and behind the German agricultural co-operative movement is the thing for which it is most distinguished, the method of financing the co-operation among the farmers. It bears the name of its founder, F. Raiffeisen. Raiffeisen's idea was to combine the funds of a group of farmers to be used in assisting each other in buying the necessaries for the production of their crops, as for example, machinery, fertilizer, and so on.

Among the rules laid down by Raiffeisen was that all members of a local credit bank or society were charged with unlimited liability to the last cent of which they were possessed. Two benefits resulted from this. It made each individual feel a personal relationship and responsibility to the bank so that when a group of farmers loaned the funds to one of their number they knew his complete financial standing and personal character. Moreover, it limited the number of members in a local society since the members insisted on having a personal knowledge of the situation of those to whom a loan was made. When there was complete knowledge of the borrowers' standing members were more ready to extend a larger credit to the one who was worthy. This rule also resulted in eliminating the big landowners from such type of bank for they did not care to assume a personal liability which might result in foreclosure of their entire estate. Thus the membership was confined automatically to the small landowners.

Benefits Are Set Aside

SOME of the features that evolved were the thrift and death benefits. A certain sum was set aside for the development of social life among the members. In each one of the divisions of Germany, as for example, Bavaria, there has been created a regional institution to which all the locals are connected. Finally, there has been created what is now known as the Central Bank of Raiffeisen which is located in Berlin to which all the regional banks belong.

This Central Bank is a clearing house for all problems and questions of importance. Through a committee, it arbitrates disputes between members of the locals instead of their going into court.

Attached to these banks is a buying organization for the farmers' necessaries as well as a selling organization for the produce of his farm. They are in competition with the other farmers' distributing organizations. Gradually the Raiffeisen banks are coming together with other agricultural co-operatives and eventually it is believed that the others will handle all of the merchandising business with the Raiffeisen organizations doing the banking.

So successful has been the Raiffeisen plan that one finds it adopted to a more or less degree throughout Europe and the co-operative world.

It would be folly to assert that the co-operative organizations have not been injured by the conditions existing in Germany. The fact, however, that they continue to add to the membership of their locals is indicative of marvelous virility that is wrapped up in this great economic movement.

If the co-operative movement was able to emerge from the Russian chaos, the one system of distribution that the revolution could not destroy, then I have confidence that the German co-operative organizations will survive whatever there be in store for that unhappy country.

New York Admits Literary Center Is New York

If You Don't Believe It, Look at the Magazines and Sunday Sections It Publishes

By MARK V. O'NEILL

I AM violating no confidence when I say that New York City is the literary center of the world. You do not have to take my word for this. Ask any New Yorker about it; preferably one who speaks English. He will tell you the same thing. He not only tells it; he actually believes it. He gets that way from reading the newspapers of his native jungle.

There have been protests and dissenting voices from Tarrytown, Seneca Falls, Cohoes, and Yonkers. They have been traced to jealousy, though, and very properly ignored.

So pronounced is the superiority of New York in matters literary, that it has been conceded by practically the whole of the United States. Excepting only Easterners, Westerners, Southerners and Northerners, the people of our country are united in regarding New York as the official literary pneumogastric of the universe.

In a way, this is natural. All the modern literary improvements are either originated in, or issued from, New York.

Let me name a few of the most conspicuous benefits that New York has conferred upon the letters of the world. It will help to make my meaning clear.

Unquestionably the greatest single achievement has been the publishers' blurb. Starting as a tiny whisper it has now grown to a mighty roar of unadulterated bunk. But this is purely commercial.

Blankest of Blank Verse

IN FICTION, New York has shown us the never-ending beauties and possibilities of perfected pornography. In the field of poetic art, the salons of New York have furnished the blankest of all blank verse. The drama—but surely what New York has done for and to the drama is a matter of common knowledge. Very common.

In this great cultural center is gathered a group of the very choicest artistic souls. They are known as the intelligentsia, the cognoscenti, and the illuminati. This group is composed of space writers, sporting editors, sob sisters, and column conductors. They have reduced the gentle art of logrolling and back scratching to an exact science. With steady hand and compressed lips, they guide the literary tastes of America along such lines as will result in the continued supremacy of their fair city.

In the magazine field, New York naturally stands head and shoulders above less-favored cities. It has given us many news stand favorites, such as Lurid Stories, Passionate Stories, Scarlet Stories, Breezy Stories, Livid Stories and Suggestive Stories. But these magazines, wonderful as they are, merely serve to indicate the popular taste of literary New Yorkers. It is in the Sunday supplements of the daily papers that we find that elusive, exclusive something which really justifies New York's claim to literary greatness.

And it is of these supplements that I want particularly to speak. Did you ever see one of them? They are published by many of the New York dailies. They are called magazine sections, book sections, literary sections, and in the case of the more pretentious newspapers they are even called reviews. It is from these founts of literary purity and estheticism that the New Yorker derives his quaint idea of his own culture and that of his native heath.

Introducing Boris

LET us look through one of them together. We will take a "review," to get the very cream of the cream. Do not be misled or dismayed by the frightful display of lurid book advertisements that greets your eye. The reading matter is gold. Pure gold.

On the first page we have a sort of editorial. It is highly esoteric and is written by the editor himself, no less. It says so directly under it, in bold-face caps. The subject is, "Siberian Literature and Its Probable Effect Upon the Gulf Stream." I will quote a few lines from it or from something like it. Just a very few.

"A literary event of unusual importance and interest to the illuminati of America is contained in the news that Boris Boriskovitch, the Siberian impressionist, is about to visit New York, where he will give a series of readings in the original Siberian from his own unpublished works. Carnegie Hall has been selected as the most fitting auditorium and entrance cards will be on sale at the door, all subway kiosks, and barber shopskis. It is difficult to speak of Boriskovitch and his work without becoming unduly enthusiastic. This is partly because we have never seen any of his work and partly because we could not possibly read it if we should see it. The coming of the Siberian Master will be enjoyed by the elect. Arrangements have already been made for a police tug to meet him as he enters the harbor. This is a necessary step because the prison authorities at Siberia have resolutely refused to allow him to give more than five public readings in New York. In the meantime they are holding our local police strictly accountable for his safe return. Miss Viola Sqush who has already translated the master's great novel, "Imbecility," will be on the platform with him in case there are any in the audience who do not understand the Siberian language."

The purpose of this editorial is to sort of warm us up and prepare us for the beautiful thoughts which we will find as we proceed with the review.

Read Mr. Whizz's Review

YOU will notice that, although the editor writes with conscious power and authority, his style is lucid at all times. There is also a sort of undercurrent of simplicity which appeals by its very incoherence and stupidity. This is Art.

On the next page of the review we find ourselves in a perfect orgy of literary atmosphere. It is a feast of intellectuality and an uninterrupted flow of language. For here are the book reviews. They are written by the publicity departments of the publishers and mailed in violet-scented envelopes to the editor of the review. But we are not supposed to know this, so let us drink a demitasse or so.

Fruit and Old Vegetables, by Oscar Featherhead. New York: Weisenkopf, Mendelbaum & Company. 1924. $5. Reviewed by O. G. Whizz.

That sounds promising, doesn't it? Let us read what Mr. Whizz has to say.

"Poetry, as practiced by the advanced, has come to be a sort of elusive mystery, an esoteric art, the secrets of which are kept hidden from the vulgar. Year by year it has grown more difficult to guess what the poets are up to. It is particularly difficult in the case of Mr. Featherhead's first volume, 'Fruit and Old Vegetables'; the more difficult because it is as evident that Mr. Featherhead is a true poet as that he is mentally infirm.

Poetry May Puzzle You

"UNQUESTIONABLY much of his poetry will puzzle, if not actually enrage, the ordinary reader. For one thing, he is forever lapsing into the technicalities of his real profession, which is that of a huckster. Thus, in his beautiful 'Song of the Turnip' we come across the most exasperating technicalities. It starts, as everyone who is anyone, knows:

a patient turnip I
pointed at one end
and rather blunt at
the other!

but if I wait my
love will come
to me!

here in the wagon
I sit among onions
potatoes beets and
lettuce and cauli-
flowers!

Hark! Hark!
a lark? a lark?
no it is my owner
vending his wares

nice-a fresh-a da
potate he calls.
good-a da latoose
orange very swit
an' joosy.

ah my love where
are you where for
that matter am I?

"The Turnip Song has been extensively quoted and reprinted as a perfect sample of Mr. Featherhead's unique style. Here we have, at its best, his scorn of grammar, punctuation and versification. The Song, in common with most of his poems, strikes a sad note at the very beginning and this is admirably sustained throughout. Ending abruptly on a perfect crescendo of gloom, Mr. Featherhead has given us the soul of the turnip in a manner not surpassed even in the vegetable soup advertisements. But his constant recurrence to the cant of his trade is most disconcerting.

"The beautiful passage, for instance, in which the owner is made to cry out about his 'good-a da latoose,' will inevitably start a furor of discussion as to the root derivative of the word, 'latoose.' In the opinion of the present reviewer this is a simple corruption of the Anglo-Saxon term, 'lettuce': although it may be that Mr. Featherhead had one of the lesser-known Euranian word symbols in mind."

Mr. Whizz goes on to quote at considerable length from other gems from the pen of Featherhead and illuminates his quotations with simple, rugged opinions of his own.

But enough of poetry. It is too deep to be really interesting. Let us rapidly thumb over a few pages of the review and see what they have to say about fiction. Fiction is simple. Even we can understand what they have to say about fiction.

Another Contribution

SURE enough. Here we have it. This is the real thing.

Psychic Psarah, a Pstudy in Psychoanalysis, by Cutie Trixie Slix. New York: Grabowski & Katisch. 1924. $2.

This review is semi-anonymous and is signed by the baffling initials, D. F.

"In this book, whose author has just been awarded the three-million-dollar prize of the American Society for the Promotion and Promulgation of the Abnormal, we find a marvelous contribution to the rapidly increasing volume of satisfactorily morbid fiction. It is true that many of our best writers are giving themselves almost entirely to morbidity: but very few of them are capable of rising to such heights of sheer unwholesomeness as are achieved by the piquant young author of Psychic Psarah.

"Miss Slix will be best remembered by the amazed and delighted readers of her latest work in connection with her best seller of last summer entitled, "Morgan the Morgue Man." This unusual story enjoyed world-wide popularity and has been translated into many languages, including the Scandinavian, in spite of the fact that translation into this language was expressly forbidden by Miss Slix's publishers on the flyleaf of the original edition. It has also been transferred most acceptably to the silver screen.

"In Psychic Psarah, Miss Slix concentrates all of her marvelous introspective powers upon the creation of the heroine, Psarah.

"Story Is a Pretty One"

"THE story is a pretty one and tells of Psarah's gradual rise from the gutters of New York to the proud position of chieftainess of a gang of successful bootleggers. Organized society proves inimical to Psarah, however, and the last half of the book is devoted to a description of her return to the gutters. This return is also gradual.

"The gutter scenes and descriptions in this epochal book are among the strongest that the present reviewer has ever read.

"Miss Slix has a truly remarkable gutter gift, and she must cherish it carefully in order that it may delight future generations in New York, her adopted city. The literary world is impatiently awaiting her next offering."

There are more pages of the review, but we do not need to read them to know what they say. We have sampled them and a literary review offers one of those rare instances of integrity in which an entire product runs true to its samples.

It has been said that to write book reviews for New York newspapers and magazines the reviewer must first bind himself by secret oaths and incantations never to read, or even discuss, any of the books which he reviews. This report has never been completely verified, however, and it is only fair to state that it may not be true.

There is one other fact that I would like to mention in closing:

New York City is the literary center of the world.

Harvard Leads the Way

HARVARD UNIVERSITY has taken the lead in limiting admission of students. It was obvious that the institutions of higher learning must soon take stands against unlimited expansion. The demands of scholarship are sufficient in themselves to require that classes be kept small enough to permit some traces of the traditional personal instruction which formerly was the rule. Of recent years, many colleges and universities have become merely large lecture factories and the ablest professors are often as far removed from the individual student's thoughts as if domiciled in a foreign land.

In the last few years, the desire for college and university education, plus an increased ability on the part of parents to afford the expense, has flooded the campuses with students of all descriptions.

Three-quarters of a century ago, nearly all students at the colleges obtained their educations only through great personal sacrifices. They were rail-splitters and rail-splitters' sons. They earned their way. They were sons of the pioneers, of a stock fitted to benefit by education.

Today, most of the students who go to colleges and universities have their way paid for them. Some are unworthy. Some are positively harmful to their associates. Some elements which force their ways into the great colleges are of the type likely to destroy college traditions and national traditions.

Harvard takes the right course in deciding to limit its enrollment in numbers. It takes the right course, too, in deciding on a policy of selection in the students it accepts. Character, ability, and adaptability are proper subjects for examination.

There will be criticism. There will be an attempt to show that snobbishness and a lack of democracy are at the bottom of the exclusion of undesirable elements from the institution. The criticism will not be well grounded.

There should probably be some sort of provision in the regulations whereby the children of alumni have the preference in the selective process. There should be some sort of a property right in a graduation, entitling a Harvard man, a Yale man, a Cornell man, a Michigan man or a Minnesota man, to bequeath his college traditions to his sons.

But the most important thing is that American colleges be kept American in thought, in sentiment, in tradition. Wholesale admission of elements, foreign in thought and viewpoint, would soon destroy American higher education.

Excuses and Reasons

THE difference between an excuse and a reason is important to one who considers politics. Political decisions are usually motivated by reasons which lie deep down in the hearts of the men who decide. Some of these reasons are petty; some are improper; some are sinister. And seldom are these reasons given utterance to, when the politician explains his course of action.

The explanation the politician gives is the excuse, not the reason.

Colonel William Hayward, United States District Attorney for the Southern District of New York, gave a clear example of the distinction when he vigorously denounced the opposition to a real prohibition enforcement act for the State of New York.

Last year, the New York legislature repealed the Mullan-Gage State Prohibition Act, which conformed generally with the National Prohibition laws. One excuse eloquently urged for this repeal was the fear that citizens stood in double jeopardy of punishment for violating prohibition laws. The United States Supreme Court had given utterance to an opinion that the punishment under a state act did not preclude penalties under the national laws.

This decision caused vast expressions of horror by certain New York legislators. They hastened to repeal the state prohibition law, leaving the enforcement of the Eighteenth Amendment, in the most populous state, to the national laws. New York officials were not bold enough, however, openly to defy the law of the land, and gave utterance to rather mild assertions that the police and other state and municipal law enforcement agencies would be expected to make complaints for law violations under the Volstead Act.

But this state of affairs was not satisfactory. This year, even avowed wets conceded that it would be wiser to pass some sort of a prohibition law for the state.

The old cry of "double jeopardy" was brought forth.

Colonel Hayward gave reply.

"The so-called 'double jeopardy' has never been more than an excuse," he declared. "It was never a reason.

"In all the thousands of cases in the state and Federal courts under the Mullan-Gage law or the Volstead Act, I believe there is no instance of prosecution by the Federal authorities following state prosecution or vice versa. The 'double jeopardy' bugaboo is similar to the silly claim that the Eighteenth Amendment is a minority enactment, when as a matter of fact it received the most overwhelming ratification that any amendment ever received. It was submitted to ninety-six legislative bodies, two in each of forty-eight states. On the face of the returns it swept the country ninety-three to three."

Public officials who give excuses instead of reasons require watching.

Clean Up the Debt

SECRETARY MELLON was acting in accordance with the demands of propriety and duty when he told the Senate Finance Committee that he was opposed to a reduction of the sinking fund appropriations to make possible a purely temporary reduction in taxes.

The Secretary of the Treasury asserted that the present program for setting aside of the stipulated sums now agreed upon will mean the retirement of the twenty-billion-dollar National Debt in approximately thirty-five years. To reduce the amount of money raised for sinking fund purposes would lengthen that period. Such a course would be inexcusable.

The World War was an event of this generation. Its cost should be paid, as much as possible, by this generation. To assume that a generation shall continue longer than forty years is contrary to fact. Twoscore years after the conclusion of the World War it will be a new generation of men and women who will furnish the vigor, the energy, and the industry to run the Nation and the World. To impose upon that new generation the burdens of a war fought long before is contrary to all considerations of justice.

Aside from this question of justice, it is clear that the temporary expedient of reducing taxes by thinning the sinking fund resources would in fact be equivalent to compelling an increase in taxes within a brief period. The sinking fund money is to be used for payment of interest and retirement of bonds.

It is primary class finance to point out that unretired bonds means continuing interest. Continuing interests means continuing taxes.

This is election year. Certain political opportunists hope to curry favor with the voters by reducing taxes beyond the limits which sound governmental finance permits. Such a course would mean a future deficit and would pile the burdens of this prosperous era upon the future, the resources of which cannot now be known. It is not to be believed that the people will approve of such unsound business.

A Word to the Wise

SPRING is in the air, and hand-in-hand with spring we face in education the eternal question of truancy—the lure of fishing, picnicking; in short, of the great out-of-doors. That is natural and inevitable. It is being dealt with, on the whole, in a satisfactory manner. Sympathetic encouragement is being given to the proper outlet for this natural instinct.

Also hand-in-hand with spring come spring athletics. They, too, are natural and wholesome, and have a real place in every school. But the criticism is made, so urgently and pressingly from so many quarters, that athletics are usurping the place of scholastic activities in the school, that the question must give us pause.

Is overemphasis placed on athletics in America? Is it true that real scholarship is suffering as a result of it? We have the cumulated knowledge of all preceding centuries locked in books and similar documents. Are we indifferent to our priceless heritage in our overweening encouragement of physical prowess and competition? Is it true that the natural student, the delver after knowledge, is dubbed "grind," "stude," "shark," and as such shunned by the athlete and his "rooters," who constitute the majority? Is it true that cups and awards are granted for athletics, while careful, consistent scholarship is permitted not only to go unawarded, but actually to be considered a mark of "queerness," in after life to be set down well toward the bottom in the scale of compensation?

If these things you find to be true in your community or in your experience, then don't you agree that the time has come when a more even balance should be struck between body and mind, between work and play? If "All work and no play makes Johnny a dull boy," conversely, surely, "All play and no work (or as little as possible to slide through) makes Johnny a one-sided boy, ill equipped for the battle of life.

Poor Pay False Economy

WHEN superficial critics are looking about for something to criticize, they often pick on Ellis Island and hurl their most caustic adjectives and bitter nouns at the physical accommodations and human management of that great distributing point for immigrants.

Accommodations at Ellis Island are insufficient. They should be made adequate and the equipment at the alien gateway should be modernized. The understanding is that the present Congress intends to appropriate money for this purpose.

The human personnel at Ellis Island is even more important. It has been unjustly criticized. In the handling of hundreds of thousands of persons annually, it is obvious that there must be some discomfort, considerable sorrow and occasional injustices. The law is not made at Ellis Island. In the inevitable hardship which strict enforcement of necessary legislation brings there are often instances of individual suffering which appeal to general sympathy. These are magnified and broadcast by alien blocs.

But there are other reasons for sympathy which seem to have passed almost unnoticed in connection with Ellis Island. They are the salaries paid to the Ellis Island employes. It became known recently that there has been only a slight change in the Island's salary schedule since 1908. The immigration employes are practically the only public or private employes in the country who have not been considered in the revision of salaries to accord with changed living costs.

Their pay should be revised, radically upward. Ellis Island employes should be among the best paid in the land. The need of capable and faithful employes is nowhere greater. The safety of the country's future is in the hands of these men and women.

Mathematical students are familiar with the axiom, "Things equal to the same thing are equal to each other." A school district applies to a bank for a loan with which to build. The banker secures the money from his Federal Reserve Bank by rediscounting commercial paper. The Federal Reserve Bank has received the money at cost from the United States Treasury by the deposit of certain specified securities. The axiom applied is that the school bonds on which the banker draws interest are the real security for the money issue. Why not eliminate the banker and the Federal Reserve System from the deal, deposit the school bonds with the Treasury on the same terms given the Federal Reserve System, saving to the district the entire interest burden?

Battle Is On to Save the Wild Flowers

Stern Campaign Needed to Prevent Stripping of Nation's Beauty Spots

By E. I. FARRINGTON

NATURE lovers in New England are fighting to save the mountain laurel from extinction. In California they are struggling to prevent the total destruction of the wild yucca. These are among the most typical and impressive plants in America. All over the country efforts are being made to preserve the lesser wild flowers, with varying degrees of success. Changing conditions have threatened to wipe out many of the native plants almost before their disappearance has been realized. In former days great colonies of fringed orchids, gentians, trailing arbutus and similar lovely examples of our native flora were to be found. Raids upon them were few because they were difficult of access. With the coming of a new era in transportation, which made remote rural districts accessible in a few hours' run, the lovely wildings, the ferns and the bolder plants like the laurel, were no longer to be hidden. They were seized upon with delight and plucked with abandon, not so much in wantonness as because few persons realized that they differed in habit from the common wild flowers like the daisy and buttercup which might be gathered without restraint.

The women of the country are to be thanked for beginning a crusade to save the wild things of the woods for future generations. It is the women who have organized such potent agencies as the American Wild Flower Association and the New England Society for the Protection of Native Plants. With leaflets, lectures and newspaper warnings they have done much to stay the hand of the spoiler. The first skirmish has been won.

The trailing arbutus is fast disappearing.

Yet the campaign to save the wild flowers of America has only begun. A long, stern fight is ahead, for commercial interests as well as the carelessness of tourists, the thoughtlessness of schoolboys and the ignorance of newcomers from other lands must be reckoned with.

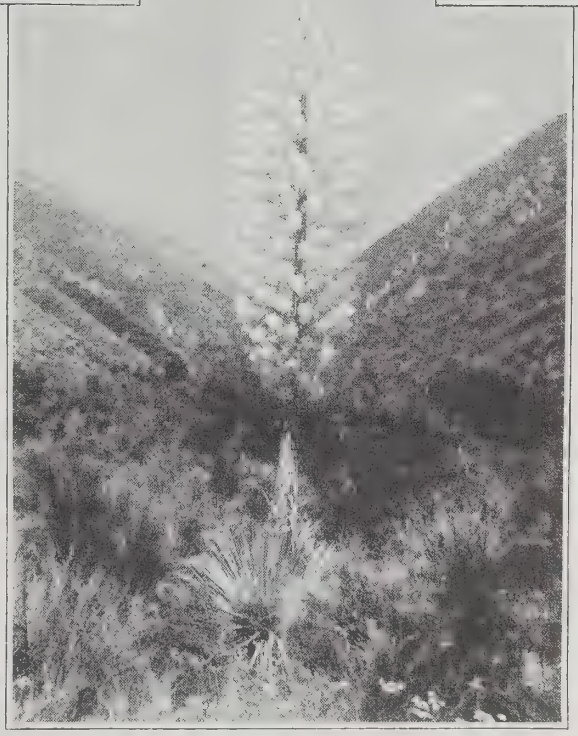
Few plants are used so extensively for decorative purposes as the mountain laurel (*Kalmia latifolia*), the calico bush of the farmer, and a plant which Congress has been asked to make the national flower of the American people, growing as it does over a large part of this continent and in no other land. This laurel is evergreen and its foliage keeps fresh a long time when cut. Those two facts make a strong appeal to the florists, who use it literally by the ton all the year around. Christmas wreaths are made largely of laurel in all the eastern states. Churches are festooned with laurel ropes for weddings. Laurel is draped in homes and ballrooms for all kinds of social occasions.

Vast amounts are needed to meet those uses, but the supply seemed likely to remain adequate until cities began to employ it with the utmost lavishness for decorating their streets on holidays and especially at Christmastide. Probably Springfield, Massachusetts, has been the most flagrant offender. For several seasons that city has strung at least 10,000 yards of laurel roping along its downtown streets as a part of the merchants' plan for creating a holiday atmosphere and thus increasing their business. This last season the city council voted such action against the most bitter protests on the part of the Springfield Garden Club and contrary to the expressed desires of many churches. Indeed, a controversy arose which filled the papers and engendered a feeling of antagonism which is as far removed from the spirit of Christmas as anything could be.

As might be expected, there are two sides to the laurel question, and there was right on both sides in Springfield. Laurel, if ripped up ruthlessly, can readily be exterminated. If the branches are broken off, they will die back to such an extent that the plants will be long in recovering. If, however, they are cut moderately with a sharp knife, the effect will simply be that of pruning. Most of the flower buds will be removed, so that there will be no burst of bloom to glorify the spring, but the plants themselves will be benefited rather than injured. There is almost no laurel plantation where cutting cannot be done every other year in such a way as to yield an enormous amount of laurel for decorative purposes without endangering the existence of the plants. If farmers would bear this fact in mind, laurel might well be made a steady source of revenue. Indeed, there seems to be no good reason why laurel should not be cultivated by farmers or in nurseries expressly to provide decorative material.

As the business of laurel gathering is carried on, however, there is real danger that it will be entirely destroyed in many sections where it now grows abundantly. It is broken off and pulled up with utter ruthlessness and, even at the best, there is a limit to the amount which can be used without inviting destruction. Some cities which formerly trimmed their streets with ropes of laurel have voted to discontinue the practice. Indeed, there are certain florists who have foregone the use of laurel even in indoor work, although the necessity for such abstention is to be questioned.

Vermont is blessed with acres of wild ferns, which make a lovely green carpet under the trees. These ferns are gathered by the thousands every year and shipped to all parts of the United States. The bright bits of green which the florists obligingly wrap up with your half-dozen carnations or jonquils may have come from the mountain sides of Vermont. The picking is done in the autumn and the ferns placed in cold storage until the florists call for them. The pickers are farmers and their families, who sell their crops to dealers, some of whom own large packing plants. A single dealer has been known to handle 50,000,000 ferns in one season. These ferns, however, are cut. The roots are not disturbed and there will be another crop the next year. The life of a fern colony is not threatened even by such a commercial process. It is entirely different with the city visitors who are not familiar with ferns and their habits. All too often rare and delicate varieties are pulled up by the roots, soon to perish for all time. There are some kinds, like the Dicksonia, and even the sensitive fern, which seem able to care for themselves under most conditions, because the roots burrow very deeply and are likely to be broken off rather than pulled out of the ground. Many others, however, like the ostrich ferns, the bladder ferns, the oak ferns, and the spleenworts are easily killed out and are already becoming rare, and the beautiful maidenhair fern is now extinct in many places where once it grew freely. The rattlesnake plantain is disappearing from its former haunts largely because of the depredations of collectors who combine it with ferns and partridge berries and offer it for sale on the street corners in the cities.



The wild yucca of California.

New England mourns for its sweet-scented trailing arbutus, or as it is called in that part of the country, the Mayflower, although the name is given to other flowers in other sections. This is a running plant and it is very difficult to gather the flowers unless the roots themselves are pulled from the ground. For years great bunches of Mayflowers have been sold on the streets each spring, and many are still to be found on Cape Cod, but whole colonies have been entirely wiped out and each season the flowers become more difficult to find. Persons who really love the wild flowers refuse to buy the arbutus from street peddlers. In many places its companion, the wild phlox, has disappeared, too.

It is the plant which is shallow rooted and so comes up easily that is most quickly killed out. The dainty bluebells are an example. If such flowers are to be gathered at all, let them be cut with a knife or a pair of scissors, so that the plant may come up another spring.

In years past the bloodroot and the painted cup, the butterfly weed and the pink sabbatia flourished in colonies over a wide area. Who can find them now, save a few scattering plants here and there! And if there are spots where they abound, we may be sure they are far from the open country and that the secret is guarded jealously by the few nature lovers who may have stumbled upon them.

There are some kinds of wild flowers which have an unusually tenacious hold upon life and which may be gathered freely without much fear of wiping them out. Among them are the buttercups, the daisies, the wild roses, the meadowsweet, the wild asters and the goldenrod. The purple-fringed orchid, on the other hand, and the lovely blue gentian can be wholly destroyed in a few seasons' picking.

Many wild flowers are annuals and are multiplied only by seeds. If all the flowers are picked there will be no seeds to drop into the soft earth or be wafted to new locations on the breezes. And then there will be no flowers the next season. Much can be done by making lists of the wild flowers which are propagated in this manner, distributing them among school children and more particularly among campers and tourists. It is no unusual thing to see the members of a camping party returning from an early morning stroll laden with delicate wild blooms which they have collected and which have already begun to wilt in their warm hands. Some wild flowers are decorative and last well when cut, but most of them make but little appeal to the eye except as they are seen nestling in their half-shaded retreats, shy and lovely in their solitude.

The mountain laurel of New England.

It is these more delicate plants about which most is written, but even the bolder kinds are threatened with extermination as a result of ignorance and vandalism. Not many years ago the eastern states abounded in fine specimens of American holly, one of the most beautiful of trees. Now the hollies have largely disappeared from the neighborhood of all large cities and are becoming rare in more remote sections.

In California ti is the so-called wild yucca, properly called *Hesperoyucca whipplei*, upon which the tourists prey. This plant, which sends its gigantic wax-like blooms towering high into the air, adds not a little to the landscape and attracts much attention from eastern visitors. Yet thoughtless travelers make a practice of chopping down the great spikes of bloom, thinking to carry them home, although in point of fact the blossoms wilt and die almost as soon as plucked. The Automobile Club of Southern California is co-operating to prevent the ravaging of these wonderful flowers.

Wild flowers in the Northern Pacific states are plentiful and lovely, but the residents of that section have long been active in efforts to preserve them for generations to come. Portland, Oregon, was one of the first cities in the country to take measures in this direction, using the following well-worded sign throughout the famous Macleay Park:

> PICK NOTHING.
> Please Read This
>
> "There being a strong desire on the part of the citizens, the Lewis and Clark Board, and the Park Board to have one wild spot in our city limits that is untouched and untrammeled by the hands of man, the Park Board has therefore selected as that place the Macleay Park and such portions of the Macleay Park trail as come under the control of the board. It is desired that not a fern, flower, leaf, twig, or branch of any name or nature be disturbed. While the Park Board feels that about ninety-five per cent of the community are thoughtful and appreciative, still there are a few that are careless and indifferent, and to these few it necessitates the board making stringent laws not allowing any one to pluck or mar anything. A keeper clothed with authority will be constantly kept in the park rigidly to carry out this plan, by arrest or otherwise. All good citizens will confer a favor if they will report quietly to the local keeper any depredation of this kind coming under their notice, and thus assist in keeping this park in its native wild beauty. There is plenty of room for marauders outside the park premises. It is requested that no one carry cut shrubs through the park, as this would give vandals a loophole out of which to escape. The keeper in charge is hereby requested to carry out the spirit of this statement."
>
> (Signed by the Park Board)
>
> "The Park belongs to *you*, kindly assist in protecting it."

The well-known summer resort on the coast of Massachusetts known as Magnolia was named because of the great quantities of *Magnolia glauca*, the sweet bay, which grew within its borders. Hardly any of these magnolias are to be seen now. Vandalism has destroyed them. In other parts of the country the native rhododendrons and azaleas are meeting a similar fate. What a pity! The charm of travel in America is due in a large measure to the native wild growth. Along with conservation of the country's resources, let us have also conservation of its beauty.

Facts About German Industry

What an Observer Found in His Investigations

By SAMUEL CROWTHER

GERMANY is not a country in which man may sit down and let nature take its course. It is a man-made land and therefore anything which tends to decrease industrial efficiency is infinitely more serious than it would be, say, to France, or Russia, or Rumania, or any other mainly agricultural country.

The soil of Germany in most parts is rather barren and has to be heavily fertilized. The big asset is the coal in the Ruhr—although we, with our immense, high-grade deposits, would consider that coal of low quality and scarcely take the trouble to mine it. There are also important coal deposits in Silesia. Many of these now belong to Poland. The kali deposits are extremely valuable, but a considerable portion of them went with the loss of Alsace. All the iron went with Lorraine. So now Germany is a workshop which must depend for its raw materials on imports. Iron ore, wood, cotton, copper, wool—all of these must be brought from the outside, manufactured, and then sold again on the outside.

Imperial Germany made the most of these limited resources by highly developing the metallurgical and the chemical industries and by providing cheap and good transportation by an extensive and interlocking canal and rail system. It was possible, however, to make all this development only by encouraging technical skill and training workmen. The really big asset of old Germany was trained men. The 1918 revolution struck right at the heart of the whole system because the first thing it did was to divorce labor from production. As one manufacturer told me:

Laws Hamper Industry

"I AM managing my place as best I can, but if the law were strictly enforced I could do nothing at all. My clerical forces and my workmen are by law organized into representative councils. The workers' council has a representative whom I must provide with an office and keep on my pay roll, although he does no work. I cannot put a notice on the bulletin board without his approval. I cannot discharge a man unless I can prove charges against him, and in that case he has the right of appeal to a labor court and from that body to the Minister of Labor. He can be awarded damages for an illegal discharge, just as though it were a personal injury. Four weeks' wages must always be paid on discharge. Sometimes as much as a year's wages have to be paid.

"I have no control whatsoever over wages or hours. The wages are fixed for the district on an official cost of living, which changes every week. I have no idea what my costs will be next month. We may be in the midst of a rush order which requires overtime. I cannot have overtime, no matter what the emergency. It is prohibited by law. I cannot hire a man. If I want a man, I must send to the state employment bureau for my district and they will send me the first man on the list—that is, the man who has been out of employment the longest time.

"If I have no work to do, I cannot close the shop and cut down expenses. I must keep the place going for three days a week for five weeks and not until I have done that can my application for permission to close down be heard.

"Right now I am running three days a week, but the men are doing practically nothing. I have no orders ahead and I cannot afford to buy raw materials, for the men are really only marking time.

"But it does not make much difference to me. I do not own the place any more; the wages I pay do not amount to much in gold, but neither does the money I earn. I have had to borrow from the banks for the last several years. They charge me twenty-five per cent, and practically the banks own the place."

Worker's Condition Worse

IN SPITE of all the regulations, presumably for the benefit of the workingman, his condition has steadily grown worse. Fixing wages on the cost of living and without regard to production simply raises prices and keeps wages below them. Before the war a skilled workman would average the equivalent of ten or twelve dollars a week. Now he is lucky to average a dollar a week. Of course he does not have to pay house rent because, as I said in my last article, the state control of rents has made the figures purely nominal. But there is another side to this. People will not build houses to rent, and so there is almost nothing for the building trades to do. And of course a landlord who gets no rent cannot make improvements. So, in spite of housing operations undertaken by the government, the standard of housing has greatly fallen and what houses remain are overcrowded.

The workman finds himself being steadily shoved down the scale and he strikes and strikes, but never does he strike at the right thing. He is demoralized—so demoralized that he will not even attempt to rid himself of the immense labor bureaucracy that has fastened itself on him and which he must support. Germany, in the name of social reform, has shifted from a highly productive to an almost non-productive country.

Much of what I have said reads contrary to the general reports of Germany's productive power and the danger to the world of letting out German goods. We are beginning to see German goods now in the shops and it is supposed that immense quantities are stored throughout Germany to be let loose on the world at the most favorable moment. Also one hears tales of how German industry has been remodeled, of the extensive building programs, and all that, and Herr Stinnes is pointed out as an example of concentrated efficiency.

The fact is that, so far as I could discover, Germany's actual productive power several months ago was about one-quarter of its pre-war. The line-up of imports and exports shows this, but even these cannot be taken at face value because under normal conditions everything that Germany can now produce would be consumed at home. These goods are not consumed at home because there is no purchasing power. The average German is reduced to the barest necessities of life and considers himself lucky when he can get them. There is no market for anything in Germany. Everything that is made has to be sold abroad.

I noticed a fair amount of new factory construction, but not a great deal and under present conditions I should rate these new or enlarged factories as liabilities rather than as assets because there are neither men nor capital to run them.

Now, as to Herr Stinnes. He is by no means the only magnate in Germany but he is the best advertised one. He is one of the men who received large payments in marks, when they were worth something, for holdings ceded to France under the treaty. He converted most of his marks into foreign exchange. As companies got into financial difficulties, he bought them, although seldom did he buy outright. Mostly he bought only a majority or a working majority of the stock. He extended his operations considerably outside of Germany into Austria, Hungary, Poland, Czecho-Slovakia, and Rumania, and he bought all sorts of things—steel companies, manufacturing concerns, hotels, steamships, and so on. He has extended far beyond any other German, but all the more powerful groups, such as the Thyssens, the Krupps, the Wolffs, and others have added to their holdings, until today German industry is in the hands of a comparatively few persons.

This ought to make for less wasteful methods and undoubtedly it would do so, were these chains constructed with any scientific idea. But they are not. There are a few chains running from source to consumer but in many cases the purchases represent only speculative ventures. I thoroughly believe in the consolidation of enterprises because it is only through large units that waste may be prevented. But these great German mergers are not really consolidations at all. They are just the joining of diverse enterprises under one head. They strike me as being unmanageable, but even if they were manageable they scarcely have the money with which to operate.

German Physique Gone

THE condition of German capital does not seem to be well known. The Germany of before the war was doing business on insufficient capital. For some years before 1914 money was being gradually drawn in. Since the war the government has made a great deal of money selling marks for foreign exchange, but nearly all the proceeds have gone for food. For the last several years it has been the habit of German exporters to keep as much as they can of their money abroad and everyone has heard the tales of the immense sums on deposit to the account of German merchants throughout the globe but particularly in the United States, England and Switzerland.

The purchases made inside Germany and the wages paid do not amount to anything as far as the big companies are concerned, because most of them can get marks by the ton whenever they want them. But they had to pay for imported raw materials in foreign exchange and the amount of the exports minus the raw material imports has not been large enough to permit any great balances to be accumulated. The best estimate I have been able to get at is that around two hundred million dollars is on deposit for Germans in the United States and that their deposits in other parts of the world will not exceed three hundred millions. Doubling this total, we have only one billion dollars, which is not enough working capital for the industries of a great nation and it is the only working capital which Germany has.

Affairs were troublous enough until the French occupied the Ruhr and the season of passive resistance began. It meant that the government at Berlin undertook to feed the millions in the Ruhr and at least in part to pay the wages of the men. It was the printing of marks to finance passive resistance that finished the mark. That is one side of the occupation.

The other is that it cut off the chief coal and metal supply from the German factories located outside the Ruhr. It was just as though the Pittsburgh blast furnace region were cut off from the United States.

The majority of Germans implicitly believe that the last war was a defensive one. At the close of the war, militarism was dead. But the Ruhr occupation has revived it. The occupation is not onerous in a big way, but it is distinctly petty and irritating. I had no trouble in going about the Ruhr at will, but a German must have special permission to travel. And so now the Germans hate the French with an intensity which means that another war is only a question of time.

It will be a long time, however. For one thing, it will be years before the German physique is built up again. It will be years before costs can be brought down, excepting at the expense of wages, and costs brought down at the expense of wages are terribly paid for. It will be years, therefore, before the country will really be a going workshop and perhaps by that time the temper of men will have changed.

Heart of English Newspaper Is Editorial Page

Concluded from page 2

be at home—typewriters, shirt sleeves, tobacco, keen faces and generally youth. There were two women hard at work in the office of the *News* and—it being afternoon and the proper hour—the inevitable tea tray. The clever young man who became my guide for an afternoon divided his time between Paris and London, had been condemned to death by the Sein Feiners in Ireland and escaped in a car and was desperately anxious to work on an American paper. He turned the list of the five best English papers, which the secretary of the English-speaking Union, Mr. Wrench, had given me, squarely upside down, putting the halfpenny press at the top—with his own paper, of course, at the top of the top—and the twopenny papers at the bottom. He ate pigeon pie at the Cheshire Cheese with youthful relish and took me out on the fire escape of the tallest building in London—seven stories high—to show me how his paper flashed down on Trafalgar Square running news bulletins in electric-lighted letters. But he told me also of his interest in popular education and gave me the best book of Sunday school lessons I have ever seen. His name was Preston Burns and if this ever reaches him, it carries the writer's thanks.

English newspaper workers are well organized: journalists in the National Union of Journalists; compositors in the London Society of Compositors, if they work within a fifteen-mile radius of Charing Cross, or the Typographical Association if they do not; machinemen in the Machine Managers' Society; electrotypers and stereotypers in the National Society of Electrotypers. There is, besides, a National Society of Bookbinders and Paper-workers. Salaries and wages are fixed to scale. The minimum reportorial wage is nine pounds a week, though this is not held to. The foreign offices of the English press pay eighteen pounds and the Paris offices pay thirty pounds.

Begin on County Weeklies

THE reporters are not, commonly, university men and there are no schools of journalism, though a reputation for good work on "Public School" publications helps. Reporters usually begin on County Weeklies, of which a little more presently, and serve a most thorough apprenticeship. The *Mail* and *Express* are considered excellent training schools. In general their work is carefully done with a better use of English than commonly holds in the American press. The Free Lance—a tradition of Fleet and Bouverie streets—is now only a tradition. A "stunt" is the Fleet Street equivalent of the American "scoop," though not quite, for a "stunt" may be a drive against a prime minister—the *Express* boasts itself to have made and unmade three cabinets—or a grave, and illustrated, discussion of the rightness of one-piece bathing suits for the English female, or an arbitrary exercise of power in the making or unmaking of reputations. For example: one of the uncrowned kings of the English press had a friend in Parliament who entertained unpleasant recollections of a passage at arms with a fellow member and reported a heated version of it to the uncrowned king. "Very well," said the Personage, "we will turn the paper on him," which was done with vitriolic bitterness and kept up. Two or three weeks later the member of Parliament met the uncrowned king. "Why," he said, "are you heckling X?" "I thought," was the answer, "you wanted it." "But we are friends now." "Very well, then, I'll call the paper off."

Journalism is always, save for those who know, a profession in which only the paper has a name. It is so in London where an immense amount of good work is done by men who are not even known to the generality of their guild. Signed articles are the exception; "our special correspondent," "our own correspondent," "our diplomatic correspondent" do the work. But there have been great names in Fleet Street and Bouverie for all that. Charles Dickens founded the *News*, and Archibald Forbes later reported for it, Kipling wrote for the *Mail;* the *Pall Mall Gazette* counted among its contributors George Eliot, Charles Reade, Anthony Trollope and Tom Hughes. Archibald Hurd was foreign correspondent for the *Telegraph* and Sir Philip Gibbs is Fleet Street trained. There has been in general a closer alliance between literature and the press in England than in America. Delane—long-time editor of the *Times*—is perhaps the greatest tradition of more recent English journalism. In his thirty-seven years of editing he is said to have seen more sunrises than any other man in London.

Small Papers an Influence

THE county weeklies are a distinct influence in English provincial life. Solid journals as big as the *Times* or *Telegraph*, whose front-page advertisements offer you at auction anything from the furnishings of a vicarage to a dairy, with chickens, dogs and farm tools for good measure. They reflect the deeply rooted, steady-going quality of English countryside and market town life and are the training schools for the London reporters besides, report county cricket and tennis, provincial births and deaths, flower shows and marriages, Jackie Coogan in "Daddy," what is happening in Denham, Haslington and Yewsley, and do not overlook the world at large. We have nothing like them in America. The Middlesex *Advertiser* and *County Gazette* and the Westmoreland *Gazette* are excellent papers of this class.

There are Sunday pictorials with a circulation of from two and a half million to three million copies, and the *Spectator*—old as Queen Anne and Steele and Addison and new as Strachey. And there is always *Punch*.

When "it's over, over there" you buy a Liverpool *Daily Post and Mercury* at the dock and never read it. Yesterday's newspaper at sea is the unprofitable intrusion of what is finished into a world whose realities are sea and sky and the day's run and the harbor on the edge of a new world, and home behind the harbor.

Roosevelt House a Mecca for Thousands

Museum of Rooseveltiana Founded in New York Home Where President Was Born October 27, 1858

By J. OLIN HOWE

Roosevelt House.

ROOSEVELT House is at 28 East Twentieth street in New York City. Here Theodore Roosevelt was born on October 27, 1858. Here thousands come, from all parts of the United States and from far foreign countries, to look over the home of his boyhood in all its intimate details.

They see the room where he opened his eyes when he came into this world, the back parlor with the little chair which was his especial property, the gymnasium on the rear piazza where he began the fight which made a vigorous red-blooded man of an anemic, asthmatic boy. They observe the Rooseveltiana in the museum or consult that in the library; and many come for information of varied kinds about Roosevelt.

Roosevelt House was opened on T. R.'s birthday last autumn and quickly became a real American mecca, a dear and sacred spot amid the bustle and turmoil of business. No day passes without bringing fresh evidence that Greatheart lives in the hearts of the American people. And from Roosevelt House his influence still spreads over the broad land and far outside.

Here is the headquarters of the Roosevelt Memorial Association and of its committee "on the perpetuation of Roosevelt's ideals," whose name phrase gives an accurate indication of the scope of its activities.

Governor Pinchot, of Pennsylvania, is chairman of this, and Herman Hagedorn, Roosevelt's biographer and director of the association, vice chairman.

Other members are Lawrence F. Abbott, of the *Outlook;* R. J. Cuddihy, of the *Literary Digest;* Dr. Albert Shaw, editor of *American Review of Reviews;* E. A. Van Valkenberg, of the Philadelphia *North American;* Mark Sullivan; Carl E. Akeley, sculptor and naturalist; Governor Henry J. Allen, of Kansas; Professor Albert Bushnell Hart, of Harvard; Dr. Alexander Lambert, of New York; Mrs. Medill McCormick, of Chicago; Mrs. C. A. Severance, of St. Paul; Oscar S. Strauss and Henry C. Wallace, Secretary of Agriculture.

Roosevelt House is maintained jointly by the Roosevelt Memorial Association and the Women's Roosevelt Memorial Association. It is really managed by the latter, whose project it originally was, but out of the nearly $2,000,000 subscribed by the American people to the Roosevelt memorial fund the former provided the amount necessary for its completion. Its offices are there now and the two organizations co-operate.

There are two houses, in reality: the Roosevelt home, which has been restored externally to its exact condition of sixty-five years ago, and that of Roosevelt's uncle, next door on the west. The two were formerly not connected in any way, but have been thrown together to make Roosevelt House.

In Roosevelt's boyhood East Twentieth street was a select residential street, but business has encroached upon it until now tall and lofty office buildings hedge it about on every side. This is the edge of New York's silk district, and not far away, on Fourth avenue, are the offices of magazines with which the ex-President was connected after leaving the White House.

The Roosevelt house proper has been restored inside as to the basement and the first two floors. Mrs. Roosevelt, the Colonel's sister, Mrs. Corinne Roosevelt Robinson, and others of his relatives helped out in this very generously. Friends of the family and others, sometimes at no small distance from New York, were glad to contribute furniture, pictures, bric-a-brac or other articles which had been in the Roosevelt home.

In the drawing room on the main floor and in the front bedroom immediately above on the second floor the wall paper is an exact reproduction of what was on the walls when T. R. was a small boy. In the other rooms wall paper of that period has been reproduced with great care, though possibly not of the exact pattern of the original.

The culinary department in the basement is as completely equipped as when young Theodore hid under the kitchen table from his irate father after he had bitten his sister's arm, on the only occasion in his life when the elder Roosevelt administered corporal punishment. "My father was the best man I ever knew," Roosevelt says of him in his autobiography.

In the dining room above, where now on special occasions meals are served, the same haircloth-covered chairs upon which the Roosevelt children scratched bare legs stand about the heavy dining table of black walnut. All the more solid furniture is of black walnut, which was considered the best taste in the Civil War period and that just following the war.

In the drawing room at the front on the main floor the hangings and the upholstery of the furniture are in a beautiful light blue, a faithful replica of other days. And the great chandelier in the center has had replaced among its innumerable hanging crystals that which dropped to the floor and was secreted by the boy Theodore as a wonderful treasure.

Each child had a particular chair in this room and Theodore's special little chair stands where it used to. In the back parlor is the great black walnut sofa opposite the mantel and fireplace where the Roosevelt children had morning prayers with their father. They would come rushing downstairs those mornings, the leader calling out, "I speak for you and the cubbyhole, too!" thus gaining the place between the father and the end of the sofa, with his arm about the favored one, which was so desirable.

Roosevelt tells of this in his autobiography and intimates, what Mrs. Robinson says is the fact, that he would win the cubbyhole very frequently.

There is in this room a small chair which was the boy's special pride and in which he seated the family pastor on an occasion when he was entertaining the latter ere his mother came downstairs. And over the mantel is an allegorical picture to which Theodore called the minister's attention, in which "the angel is ascending into Heaven with his coat tails flying out."

Furniture and furnishings in the front bedroom on the second floor are those which were there when T. R. was born, even to the curtains at the windows and the bedspread. And the portrait of his mother which hung above the mantel hangs there still.

The nursery to the rear on this floor has the original table and chairs. And there is the flight of steps which led out of the window to the back piazza where Theodore Roosevelt lay in his earliest youth and where he had his youthful gymnasium later on. The swinging rings, parallel bars and other apparatus have been restored.

One need not close one's eyes to imagine the spirit of the departed Colonel hovering about his boyhood home.

The Roosevelt museum and the library of books and other material by and about Roosevelt are in the house to the west, where dwelt the family of his uncle. On the top floor of Roosevelt House an auditorium occupies the space across both the old houses, where there is far more room than one would suppose possible. The rich dark woodwork upon the side walls of this room is strikingly handsome.

The museum is not large as yet, but it is growing constantly, and already has many objects of striking interest. Colonel "Bill" Sewall, the Aroostook County, Maine, guide who taught Roosevelt to shoot, has sent down the old frypan the New York youth used in the Pine Tree State in those days.

It was "Bill" Sewall and Will Dow, another Maine friend, whom Roosevelt called to his side when, in the eighties, after the death of his mother and his first wife within a single twenty-four hours, he retired to Elkhorn Ranch in the Dakota Bad Lands. In the museum are numerous relics of ranch days, even the "chaps" and hunting shirt he wore.

Sylvane and Joseph Ferris and A. W. Merrifield, who were with him at Chimney Butte, and A. W. Erickson have sent on much connected with Roosevelt's life there, and many things have been secured from other sources—his rifle, shotgun and six-shooter, his round-up hat, compass, drinking cup, even his spectacles. Roosevelt's ranch journal contains the contracts and rough bookkeeping which served to keep matters straight.

The library has four copies, the only ones known to exist, of the "Bad Lands Cow Boy," published at Medora, Dakota, in the eighties, in one of which there is a reference to "Bad Man" Finnegan, who is doing time for stealing Theodore Roosevelt's boat.

In the museum is the ranch organ which T. R. bought for the use of Mrs. Sewall and Mrs. Dow after they joined their husbands at the ranch.

The Smithsonian has given a mounted African lion skin and an unmounted topi skin which the Roosevelt expedition secured in Africa and the silver-mounted saddle, bridle, lariat, and so on of the South American gaucho which the people of Brazil presented to Roosevelt during his South American trip.

Then there are koodoo horns given by Roosevelt to Secretary Bonaparte; his Rough Rider rifle; two native Filipino swords given T. R. by Datto Piang, a native chief; the single sticks he used in the White House gymnasium in contests with General Wood; two lamps he used on western hunting trips; three master phonograph records of Roosevelt's voice; a variety of campaign souvenirs, buttons, handkerchiefs and the like; and much besides to which accessions are constantly coming in.

The Library of Congress has Roosevelt's official manuscripts, but Mrs. Roosevelt has given Roosevelt House his scrapbooks, about which a separate article could be written. In addition, the library of Roosevelt House has nearly two hundred original Roosevelt manuscripts and letters, including the last letter he wrote, on January 3, 1919, to Richard M. Hurd, of New York.

This library has upward of 15.000 pieces—books, pamphlets, magazine articles, clippings, cartoons, and so on—of which Roosevelt himself wrote more than a thousand. Mrs. Roosevelt has given it the manuscript of his speech and the spectacle case which saved the ex-President's life when he was shot in Milwaukee during the campaign of 1912.

Roosevelt's Spanish War diary is also her gift. The library has the diary of his South American trip, and the only known copies of the minutes of the Little Missouri River Stockmen's Association.

Remarkable is the collection of original cartoons, many of them given by their makers; and there are myriad photographs, including several rare early photographs of T. R. and those associated with him and a valuable group taken by him at his Elkhorn Ranch, with his original notes on the back of them.

The Roosevelt Memorial Association has for its honorary presidents Secretary of State Hughes, ex-Secretary of State Elihu Root and General Leonard Wood, and for honorary vice-presidents, James R. Garfield, Senator Hiram Johnson and Senator Henry Cabot Lodge.

(*Concluded on page 13*)

Theodore Roosevelt's favorite photograph.

The spectacle case and manuscript of his speech which saved Colonel Roosevelt's life when he was shot in Milwaukee during the campaign of 1912.

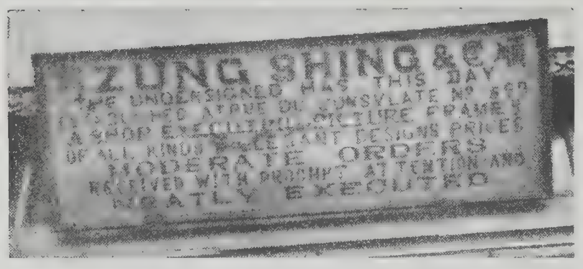
"Pidgin" English on Chinese Signboards

The Language as "She Is Writ" for Advertising Purposes in China Is Wonderful and Fearful to Behold

By CARROLL K. MICHENER



Zung executes picture frames.

SCARCELY had we been installed in our hotel at Shanghai when Vong, the "room boy"—which is to say, the gray-haired Oriental who served as chambermaid on that floor—introduced to our attention his friend, the tailor. This felicitous circumstance brought us first acquaintance, not only with that astute individual, but, generically speaking, with the essential business man of China.

It appeared, from his card, that we were in the presence of Sing Chong, personifying the "Looknice Company." The card violated our notion of things Chinese. We had expected not a white pasteboard oblong, bearing in neat English print the names of Sing and his "attractive-aspect" concern, but a strip of red paper huge enough for a billboard or to wrap a case of firecrackers, and emblazoned with black ideographs.

How we fared at the hands of Sing Chong is hardly a part of this narrative; though it may be said, in passing, that we learned about business from him. The transaction was profitable for everyone concerned.

We had been warned to submit a model. Sing Chong asked for one, in fact. And though we doubted that old story of Chinese fidelity to pattern, which relates the affair of the new trousers that came from a tailor patched at the seat exactly like the old, we were diligent in seeing that our sample suits were no more and no less than we intended to reproduce. This care, in a sense, was justified. The new garments, save for freshness of fabric and variation of weave, were indistinguishable from the old.

In arguing his merits, Sing Chong had pointed with pride to his advertisement in a Shanghai daily newspaper, published in English. We knew from this that the Chinese merchant of today did not hesitate to add to his inherited sagacity the western world's chief aid to business. His legend to prospective patrons ran thus:

SING CHONG
LOOKNICE COMPANY
GENTS CLOTHING, DRESS MAKER
AND LADIES HAT

> I had my tears in work Department of first and Practical training with the Largest Foreign Shop on Nanking Road. Onething I learned is not to "Squeeze" Material and not to overcharge my Customers to keep them. Cut a picture of a dress or Costume and hats which you like from a magazine and I will make it for you, isent this fair? Can I have-your business? Can I come and see you? or you will please ring up the number.

Sing Chong was not alone in his ambition for foreign trade, as we discovered in our sinuous journeyings through crowded, aromatic streets of both the Chinese and foreign sections of Shanghai. We found what seemed an epidemic of "pidgin" English on signboards. Search for humorous new evidences of such progressiveness among Chinese shopkeepers became something of an enthusiasm with us. We made it a hobby.

It was clear that in King Cheng Kee, Sing Chong had a lively competitor. King's signboard, running across the top of his one-story building between the gold and vermilion perpendicular "shingles" that catch the Chinese eye with their huge crow's-track characters, carried this legend in somewhat uncertain Roman lettering:

LADIES DRESS MAKER & GENERAL OUTFITTER READY MADE UNDER CLOTHINGALL FASHIONABLE EMBROIDERIE WORKS & TUKE ORDER
—AND—
EVERY KIND OF FURS & CORSETS SILK & SATINS & PONGEES OF FANCY GOODS EMBROIDERY ETC.

Next in point of numbers to the tailors in their bidding for foreign patronage were, curiously enough, the carpenters, painters and masons. This was odd because we found, from inquiry, that the services of these craftsmen were rarely subject to negotiation directly by any foreigner, but were secured as a rule through the mediation of Chinese servants or contractors. Nevertheless the Chinese lettering on their signboards was usually badly crowded by awkward, blustering and erroneous English capitals. Here, for example, was

ZEE YUNG CHONG
CARPENTER MASON GECOI-
ER HOUSE&SHIP PAINTER
DECORATOR & CONTRACTOR
AVENUE PAUL BRUNAT OF

Fong Yung Hing, in the Chungking road, had taken occasion to incorporate in the English text of his sign, the naïve explanation that the foreign lettering was "the English of Chinese." Fong blazoned himself as

CERPENTER AND MASON
PAINTER HOUSE FIX GLASS
MAKER ALL FURNITURE
CONTRACTOR

It was a bit difficult, at first, to understand completely why there should have been such a prevalence of typographical error in these "English of Chinese" signs. "YU.TAI.CHINESE.GENILEMAN.&LADYS.SNOTS.&BOTS.CO" was a rude offense to our editorial sensibilities. There was evidence, too, of faulty phonetics in the smithy sign of Yung Chong, which proclaimed him to be no less than a "poney sho mack."

But this puzzle, in time, unraveled itself; particularly when we had watched a dozen coolies, hunched over as many type cases in the composing room of an English print shop, laboriously matching the letters set forth in the "copy" before them, without the slightest knowledge of what the letters were or of anything the "copy" meant. Proofs of such type-set material came back to the compositor almost obliterated with mazes of correction marks. After this it was easy to deduce, therefore, either that the average sign painter was less meticulous than our tailor in "following copy," or that the "copy" itself was produced only after an imperfect study of best English models.

Lack of finesse in English idiom on the part of one of these interpreting savants, we supposed, must have accounted for a curious advertisement over the door of a towel maker's shop: "The towels," read this sign, "are weaving up of the different colours to sell." But this may have been, of course, simply an accurate translation of the accompanying ideographs. "Foam water," lettered over the door of a shop that sold hot tea-water to neighboring householders, was at least idiomatically picturesque.

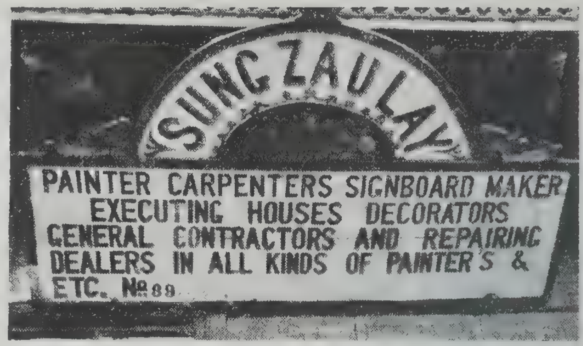
Foo Kee's hair dressing "salool."

Disingenuous, as well, was the signboard of Dong Woo, the money changer, and somewhat savoring of the printer's "pi-box" were the styles of type used:

> sale all kinds of cigars and cigarettes ALSO will be change any kinds of goldpounds and chick as foiiow countries america england france russia german italy and japan if anybody coming here we give a true to every body

The emblazonment of Zung Shing & Company savored of legal phraseology. "The undersigned"—so read his shop board—"has this day established at Rue du Consulate No. 599 a Shop Executing picture frames of all kinds & elegant designs prices moderate orders received with proompt attention and neatly executed."

It was before the sign of the dairyman, Fok Kyi, however, that we ceased to seek further for the unique. Not only had Fok avoided the callow young English-scholars of his community with their "pi-line" translations, but he had intrusted his work to a faithful calligrapher, providing as copy no less than the firm's identical billhead. In this, no doubt, he felt reasonably sure of averting error. The business, therefore, stood quaintly notified to the passing world as:



SUNG ZAU LAY
PAINTER CARPENTERS SIGNBOARD MAKER
EXECUTING HOUSES DECORATORS
GENERAL CONTRACTORS AND REPAIRING
DEALERS IN ALL KINDS OF PAINTER'S &
ETC. №89

And Sung, houses and decorators.

Dr. to FOK KYI DAIRY,
1401 Avenue Road
MONTHLY ACCOUNT
Bottles Milk @
Pats Butter @
Cheese per lb @
Bottles Cream @

We learned on the other hand, of a well-known foreign shop on Nanking Road which had been a source of keen delight to the Chinese population for years because one of the ideographs in its sign was upside down. Many of the hongs—the foreigner calls them that in China—had Chinese names that were fantastically absurd. The consular secretary told us of one that, literally translated, meant "open and shut." A scholarly Chinese, he said, was fond of informing his friends, with mock solemnity, that the name was a profound manifestation of western intellectual subtlety, meaning that the concern opened its doors in the morning and closed them in the afternoon. This was as funny to them as the case of a certain Honkew tailor was to us. The man did business under the proud name of "jelly Belly," a commercial sobriquet which, according to tradition, had been bestowed upon him by an American naval officer gifted with a somewhat rough-faceted sense of humor.

But the naïve adventures of the Chinese merchant into the realms of English calligraphy did not deceive us as to his essential business sagacity. His "English of Chinese" might be ludicrous, but his commercial practices and instincts were soberly sound. His business cunning had been cumulative since several centuries before Confucius.

And not all his signs, even in English, were curious. Along Nanking Road he had blazed a trail of electricity, somewhat less formal, but certainly no less effective than any of his most progressive foreign competitors. He had learned the value of display.

In the narrow, wooden-shuttered streets of the native quarter of Shanghai, still savoring of medieval times, there was sharp contrast. Here there was no pretense of occidental learning, and shop signs, decorously perpendicular, bearing characters in red and gold, made no bid for foreign trade.

With a translator in tow it was possible, nevertheless, to find entertainment in many of these commercial notifications. From over the door of a cash meat market, for example, he read to us the Oriental equivalent of "Cash Store." The legend ran: "No Credit Given—Former Customers Have Taught Caution."

The cobbler in the next block had expressed the nature of his calling in words of euphemism and elegance. His shop was "for the regeneration of footwear."

But if there was no English on the signboards of China at large, there was; we found, plenty of "pidgin" under the Oriental firmament of trade as a whole. English, clearly, was everywhere in China the "business" tongue in international transactions. And this was no more than the reflection of a dominant Anglo-Saxon characteristic. Englishman and American were alike in smug self-sufficiency when it came to the matter of language. He who would trade with them must speak their tongue.

This, in effect, was what was said to the Oriental when modern trade relationships were begun some century and a half ago. Hitherto, in the golden eras of the Grand Khans and the periods of the dynasties that laid claim to haughty sovereignty of the world, traders had need to speak the language of Cathay. But with the coming of the Anglo-Saxon, China began speaking, perforce, the familiar species of "pidgin" English that prevails to this day.

Other nationals, it appeared, were willing to make concessions in the matter of speech. As a result, there was no such thing as "pidgin" French, "pidgin" Dutch, or "pidgin" Russian. Numerous foreign languages were spoken, and spoken badly, we knew, by Chinese engaged in international trade, but "pidgin" English had become the international business dialect of the Orient.

We found ourselves in possession of fair fluency of that mode of speech before the end of two weeks. Early in our linguistic adventures we heard from the lips of a missionary's little daughter, a guest in our hotel, the entire Mother Goose suite couched in "pidgin." This was the one about the old lady who lived in a shoe:

One piece-ee old missus-ee have got,
Stop in one shoe.
Catch-ee too many children,
No sabbee what thing can do.

Entrance to tenement street.

Pay-ee some soup,
No pay-ee any bread;
Tan-tan-ee each man plenty,
Talk-ee chew, go bed.

At the end of our second week we were able to address Vong, the "boy," upon such an occasion as that of having left behind in our rooms some essential implement, in the following fluent and canonical "pidgin":

"Vong, you go topside, chop-chop, catch-ee one piece-ee umblella, my pay you plenty cumshaw. Spose can do?"

And:

"Can do, mastah, chop-chop," Vong grinned, anticipating his reward of cumshaw—a word that signifies "golden sands," one of the few that have been taken over from the Chinese into the business talk of the English.

In the deeper channels of trade there was, of course, small echo of the primitive language of trade. The more important foreign business firms were still addicted, we learned, to the convenient but not wholly satisfactory old system of employing a compradore. This was a direct borrowing from Chinese sociology. The compradore was the Chinese middleman, without whom nothing of any importance, from money matters to matrimony, might be undertaken.

Anglo-Saxon reluctance to learn the speech of the Chinese made the compradore an essential. Futhermore, there had always been, it was easy to discern even in modern Shanghai, a stubborn Anglo-Saxon resistance to the notion of studying Chinese manners and customs, and of modifying trade practices accordingly. The old-time taipan had declined, somewhat disdainfully, to attempt any effort at understanding the Chinese. He left all that to the compradore.

In old days the compradore's character and probity were unquestioned. He was a great man in the business community. His word was gilt-edged as a high-class bond. But China's modern political, social and financial disorder had broken down, somewhat, the compradore's high reputation for integrity. Exploitation of Chinese credit and money by unscrupulous foreigners, with consequent losses to the compradores, had tended to increase the number of defaulting Chinese. Therefore, where formerly oral contracts served, legal documents and bonds must now be exacted of the Chinese go-between.

When we had observed in repeated detail the small traffic of the Chinese streets we achieved the certainty that America possessed but a rude knowledge of bargaining. Here was trade in its lowest denomination, yet carried to the *n*th degree of finesse. More physical and psychic energy was squandered upon the purchase of a pinch of soy cheese, a sliver of varnished duck, or some such inconsiderable trifle as a broken snuff bottle—all for a consideration of about a twentieth of a cent—than would be expended in America upon a railroad bond issue.

But China had limitless time, inexhaustible patience. We recalled the legend of the woman of Soochow, who, lacking a needle, began filing down a crowbar to meet her needs. And, further, bargaining, among the Chinese was a pleasurable art. It amounted to an enthusiasm, shared in common by the entire race. It was embedded in Oriental philosophy and old custom, and had become almost a religious commandment. There was no Chinese, we were convinced, who would not haggle half a day over a dime's worth of cabbage—on principle, and for the zest of the thing—though he knew that, devoted to other pursuits, his time might be coined into dollars.

YU TAI FOR CHINESE GENTLMAN & LADIS. SNOTS & BOTS CO

Just what does Yu mean?

The signs tell of the business.

Much had been said and written, we were aware, both before and since Bret Harte, about the guile of the heathen Chinee. His ways in business, as well as in poker, were understood to be dark. And yet there was also the legend of Chinese business integrity and honesty that was supposed to be mirrored in the practice, widespread over the eastern hemisphere, of employing Chinamen as bank tellers.

The prevalence of the Chinese banker was obvious, but that, we were certain, had nothing to do with Chinese honesty. It was an evidence of efficiency and adaptability. But in spite of business cunning that outdid the proverbial Yankee shrewdness, Chinese merchandising, we were convinced, was fundamentally honest. It was true, probably, as Baltazar had said in Mr. Locke's novel, that China was a country where unless you guessed what the other fellow was thinking of, you might be led astray by what he said. But, with proper allowance for the peculiar inversions of Chinese methods of thought, the word of a Chinese merchant in an affair of business was, we would have gambled, as good as his bond. True, he might get the best of one on exchange, or inadvertently visit upon an over-exacting customer a few "three-piece"—lead-filled—dollars, but only after the letter of his compact had been filled.

Roosevelt House a Mecca for Thousands

Concluded from page 11

William Boyce Thompson, of New York, is president and William Loeb, Jr., and Will Hays are vice-presidents.

The Roosevelt Memorial Fund amounted to $1,837,353.52 at the last report and an additional $75,000 has been collected locally by the Roosevelt Memorial Association of Oyster Bay for the purchase of land for Roosevelt Memorial Park there. The National Roosevelt Memorial Association has appropriated $50,000 for the purchase of land for this park, which will cost about $120,000.

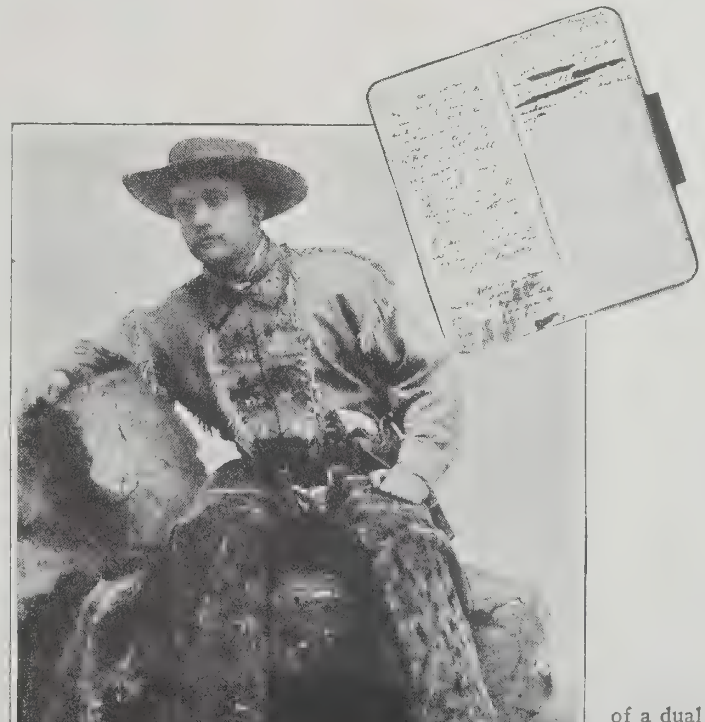
This park is one of the principal objects of the national organization, in fact. The Oyster Bay society has selected for its site a tract of fifty-three acres on the shore of Oyster Bay which Colonel Roosevelt used to hope might be redeemed for public uses, especially since the preëmption by private owners of shore property in that vicinity had practically shut off the citizens of the town from the water front. Part of this fifty-three acres is under water at high tide.

On one occasion when a project was placed before the voters of Oyster Bay to make this tract a public park Roosevelt took a vigorous part in favor of it, but the negative vote of those living in villages in the town of Oyster Bay remote from the shore resulted in its defeat.

Another leading object of the Roosevelt Memorial Association is the care of Theodore Roosevelt's grave. W. Emlen Roosevelt, as a personal tribute to his cousin and lifelong friend, has purchased and improved certain land adjacent to Young's Cemetery at Oyster Bay, where Roosevelt's body lies, and has given it to the cemetery association.

Near the entrance an attractive house has been fitted up as a lodge for the caretaker of Roosevelt's grave, whose salary is paid by the national association from a fund laid aside in perpetuity.

In every season and whatever the weather, the grave is visited by a seemingly endless procession of men, women and children from everywhere on earth. Annually on Roosevelt's birthday Boy Scout troops in the neighborhood of New York hold special exercises there, and on January 6 of each year the members of an organization known as the Roosevelt Pilgrimage pay tribute there to their former friend and chief. Until his death Dr. Lyman Abbott was the chairman of the Roosevelt Pilgrimage.



Colonel Roosevelt in cowboy costume.

Another main purpose of the Roosevelt Memorial Association is the erection in Washington of a monumental memorial to the ex-President. A competition of a dual nature is in progress—of ideas and of designs. The winning ideas will naturally play their part in the second phase of the competition, the first prize in which will be the commission to execute the monument.

No site has as yet been selected, but perhaps it would not be amiss to locate the memorial in Rock Creek Park, the beautiful stretch of country which Roosevelt loved so well and in whose rustic fastnesses he spent all the time he could.

Provision has been made for the inclusion in this competition, without prejudice or favor, of the design submitted in 1920 by Carl E. Akeley and James Brite. This is for a remarkable symbolic monument in the form of a huge, monolithic lion.

A PAGE FROM ROOSEVELT'S SPANISH WAR DIARY.

The entries in the diary for June 5 to 11, 1898, inc., read:

"No words can paint the confusion. No head; a breakdown of both the railroad and military system of the country. Mounted drill very good, much admired by foreign attaches. No plans; no staff officers; no instruction. Each officer finds out for himself and takes his chances. We are doing as well as the regular regiments. Have very light baggage.

"Told to go aboard transport. Worst confusion yet. R. R. system utterly mismanaged. No allotment of transports. Utter confusion.

"After we were embarked we had to stay still! And the administration here beats everything.

"Delay in harbor under the tropical sun very bad for men."

Working to Make All the World Healthy

Agencies Named by League of Nations Campaign Against Disease

By WILLIAM ATHERTON DU PUY

THE biggest thing that any of us have ever bumped up against is old man world whirling around out here in the great spaces with only a gravity string holding him to his course. One of the tiniest things we have known is young sprout microbe which gets into our victuals or our air, enters our system without knocking and begins to bore from within, thus handing to us various varieties of the pip.

Just of late it has come to pass that these two individuals have signed up for a fight, all organized and everything, a fight to a finish. On the face of it one would say that it is an inconceivably unequal combat but it has been going on in a guerrilla sort of way for a long time with many successes chalked up to the credit of the little fellow. But now the world has seen a new light, has got a new idea. That idea grew out of the war. For lack of it the Allies floundered for four years and lost millions of men. In the end it won the war. That idea is *unity of command.*

The League of Nations is just now bringing the whole world to work in unison on the idea of sanitation and health. One cannot see at a glance just how big an accomplishment this is. Maybe it is big enough to recompense the world for the war. Maybe it will save more people than were lost in that holocaust. It appears pretty big. Let us take a look at the manner in which the world was induced to present a common front to its myriad, microscopic, ancestral enemy.

In Paris, after the war, when an attempt was being made to write into a treaty a world agreement for the future, someone inserted Article 23 into the controversial document there drafted a statement that: "Members of the League will endeavor to take steps in matters of international concern for the prevention and control of disease."

Before the war nations had recognized the existence of the necessity of studying health conditions beyond their borders. The United States, for instance, was interested in yellow fever to the south, for it had swept New Orleans, even Philadelphia, in the past; in bubonic plague from the Orient, for a rat had once shinnied down a hawser in San Francisco and given it to prairie dogs who kept it alive for years; in sore eyes which came to America with immigrants in the steerage and got hold of the mountaineers of Kentucky. Certain diseases, existing anywhere in the world, might spread as does the gypsy moth. Public health was an international problem. The health services of the nations tried to keep track of the epidemic diseases and protect themselves against them but there was no common action.

After the war a quite terrifying situation developed that served the purpose of spotlighting the grim, slathering monster of contagion, licking his chops there on the eastern frontier of Europe. Typhus, the old jail fever of the Civil War, born of vermin that crawl, was running among the repatriates like flames in dry grass. It was spreading west. Thousands were dying. A score of nations had it. Others were threatened. No one knew where the plague would stop.

How Typhus Is Fought

THE League of Nations, under its scant covenantal authority, appointed an epidemic commission consisting of three men of continental reputation. They were to be its advisors. They suggested that international cooperation be brought about under the auspices of the Office International d'Hygiene Publique, of Paris, a voluntary association of the health services of the world. The Polish Government took the initiative and called a conference of health agencies of the world to meet in Warsaw in the summer of 1920 to study the typhus situation. Nearly all the nations of Europe were represented, among them Germany, Russia and Turkey. They mapped a program, raised a common fund for the campaign. They tied the nations together for fighting typhus. The league secretariat ran the meeting. The responsibility for keeping the mill working was placed with the league. Under the old scheme conventions met and passed resolutions, adjourned and forgot them. This secretariat at Geneva carried on the work of the Warsaw Conference. The league itself built upon it.

A health section was created at league headquarters in Geneva, with its secretariat and technical staff. Great pains were taken in selecting a man to head this section. Finally a Pole was selected, Dr. Rajchman, head of the Epidemological Institute, of Warsaw, and a leader in the big battle on the eastern front. Dr. Rajchman had gathered experience as an inmate of Russian prisons during the war. He wrote and spoke seven or eight languages. He had the habit, which still sticks to him, of working 18 hours a day. He is dark, thin, sprightly, bald, smiling, energetic. He is the Foch of the allied army against disease. There is unity of command.

The League of Nations established a second agency to work with it, the Council, the Assembly, Dr. Rajchman—a technical advisory committee. This committee now has 14 members and may eventually be increased to 20. These members are the best experts that can be found among the health services of the world. Surgeon-General Cumming, of the United States, has recently become a member. The committee meets once every three or four months, oftener in emergency. Every time it meets it surveys the world, scratches its head and asks itself just what there is that can be done to advance the idea of co-operation among nations for the elimination of disease. There is always plenty to do. The committee makes its recommendations to the Council and the Assembly. Through these bodies 52 nations take action, authorize campaigns, instruct their permanent staffs as to what to do. Their action is virtually the action of the world.

Here are some of the concrete things it has done. It established three training schools for health officers in the East—one in Moscow and one in Kharkov, Russia, and one in Warsaw. There are always some 70 picked men in each of these schools taking three-month courses in sanitation and public health methods. This is an attempt to supply a need for sanitary officers in that part of the world.

Another venture has been undertaken that is an enlargement of this idea. It started with an invitation to two members of the sanitary staffs of 10 East European nations to visit Belgium and Italy, spending six weeks in each country studying sanitary methods as there applied. The Rockefeller Foundation bears the expense of these pilgrimages. This venture was a great success. The prize student was a man from the wilds of Russia. It resulted in a similar invitation being issued by Great Britain and Austria. Nineteen nations accepted and sent two picked men each. Among these were two from the American Public Health Service.

In Paris, in 1912, an international sanitary convention was held. Among other things it wrote an agreement among the nations on such questions as quarantine regulations.

Further studies under the advice of a health committee of the league are to be organized and the results of these studies are to be considered at a world conference. Regulations set down at this conference will be administered through the league.

Work on Regional Problems

THERE are very important regional problems. The Eastern Mediterranean, for instance, is given to certain epidemic diseases. It is important to the nations of that part of the world and, for that matter, of all the world, that every precaution should be taken to control and eradicate those diseases. A commission has therefore been dispatched to that part of the world. It will write a convention, an agreement among the nations affected, with relation to the measures needed. It is probable that a regional convention will be called and that the interested nations will work out of this movement a program for common action that will clean up the Eastern Mediterranean.

In the Far East there is an entirely different regional situation. There are many ports of call in the Orient. There are peculiar diseases in that part of the world. There are at places regulations that do not afford the necessary protection. There are at other points quarantine regulations that materially interfere with shipping. If a suspected ship, for instance, has been held up and has undergone quarantine at one port, it is an unnecessary hardship if it is forced to endure the same delays at the next port of call. There should be co-operation among these ports. A commission is now in the Far East studying this problem.

It is likely that Africa will furnish the problem for another regional study and convention. What sanitary control existed in Africa before the war has largely disappeared. Germany had extensive colonies there and her establishment was destroyed. Those colonies have now come under mandate and the conditions that exist in them are therefore an international responsibility. "Sleepy" sickness (an entirely different thing from the "sleeping" sickness of civilization) is causing a great deal of trouble. It is to be studied and an international attack is to be made.

New problems have arisen here and there about the world. There is the Danube River, for instance, which is much more of an international waterway than it used to be. The sanitary problems along it are international problems. The sanitary regulations having to do with shipping are international problems. Agreements are necessary with relation to emptying sewage into the Danube. It furnishes a regional problem which requires study by an international agency and presents a need for agreements which must be internationally drafted and enforced. It is another of the infinite number of international tasks that are gravitating to the League of Nations.

Common Standards Needed

IN MEDICINE there is great need of establishing common standards in such matters as the strength of medicines. Canada, for instance, recently discovered insulin, a cure for diabetes. It is a matter in which the hygienic laboratories of the world are greatly interested. They will be talking about it, experimenting with it. It is one of those serums that is measured by its reaction on some living creature, man or experimental lower animal. There are other such serums, anti-tetanus serums which save the victim from lockjaw, anti-diphtheria serums, which save babies' lives by the thousands a year. There should be common measures of strength in these serums. In some of them the unit in the United States is 60 times as strong as the unit in Germany. One who had been accustomed to use the German drug might get hold of the American drug and give as many units of it as he had been giving of the German preparation. The patient would be killed. There should be agreements in the hygienic laboratories of the world, standardizations of these units. It is another type of problem that this international health organization will handle.

But it is probably true that the biggest advantage in the whole program will come through the fact that the whole world will become a reporting agency for the health section of the League of Nations. There has never before been any central world agency to which any outbreak and any disease would be reported and which would be in a position to act on its information for the interest of the whole world. Now everything comes to Geneva. It is promptly digested and put into reports. These reports go forward to all the health departments of the world. Month by month the growth of an epidemic, if one should occur, would be shown by the graphs of this world health agency. If such an epidemic should assume threatening proportions the force of the health agencies of the world could be concentrated upon it. This health agency has not had an opportunity to come to grips with an epidemic since, in its swaddling days, it grappled with Russian typhus. It is fairly safe to say, however, that from this date forward the dragon will need but rear its head of contagion from the miasmatic atmosphere in which it breeds to find itself bludgeoned into submission by this new common weapon of the nations.

"Vetoing Vic" Donahey, Ohio's Fighting Governor

Concluded from page 3

it had been one of his ambitions to have a degree but that he had not earned it and could not and would not accept anything which he had not earned.

So much for Donahey, governor. When he leaves his office he goes home, for he is a home-loving man. He likes to be with his family and he has to stay at home a considerable portion of his time if he cares to keep acquainted with his family. It would make the heart of Roosevelt glad to know that the governor of Ohio is the father of a dozen children, ten of whom are living and nine of whom stay at home. He's the pal of his sons, all six of them.

Donahey likes to work in the garden and the fact that he is governor of Ohio does not preclude his putting on his old togs to hoe, spade and rake the garden patch. It is of record at the state house that the only Friday he has been absent was when he went to New Philadelphia to get his garden ready for planting. It is not an uncommon sight for passers-by at Columbus to see the governor engineering a lawn mower over the spacious grounds surrounding the executive mansion.

Donahey caused an international sensation when he took as his chauffeur on a fishing trip into Canada a life termer at the Ohio penitentiary. Stories were published that he would be requested by the Dominion authorities to send him home. The governor on his return, however, stated that nothing was said to him and that the agitation was for political purposes.

The occasion gave him an opportunity to get before the public his attitude toward prisoners.

"Those prisoners out there in the penitentiary," he said, "are not all bad. Some of them are real criminals and they should remain there, but others, and many of them, are there because of circumstances and because of acts committed in a moment of anger. The chauffeur whom I took to Canada killed a man in a brawl when he was only nineteen years old. Do you mean to tell me that that boy is bad? He has served seven years. I believe in giving him another chance, a real chance to make good and to become a useful and respectable citizen. He would give anything to undo that one act.

"Is it humane to condemn him eternally? In my younger days and in yours, you have had fist fights. Nearly everyone has. Suppose in one of them you had killed your opponent. It might easily have happened. Would the ends of justice be served by condemning you to a life behind the bars? I think not.

"Not so long ago the warden (P. E. Thomas) came to me. He told me that a young prisoner, sentenced for life, was about to lose his mother who lived in another state. The warden had granted many prisoners permission to attend funerals or visit sick relatives and to return on their honor. But the prisoners had all lived in this state. The young man was brought before me and I asked whether he would return if we would grant him this privilege. He told us, with tears in his eyes, that he would; that he wanted to see his mother before she died. We granted him leave and he kept his promise although he had plenty of opportunity to escape."

One of these prisoners has since been pardoned and the other paroled.

Governor Donahey uses inmates of the penitentiary as servants at his home and one or two of those fitted for it are employed in the executive offices.

The governor is very fond of the essays of Emerson and it probably was one of the magnificent thoughts of this great thinker which set the young Vic toward the governorship.

Donahey isn't much of a politician, as the attributes of a politician are reckoned by politicians. Recently he named a man of opposite politics as a special investigator under direction of the governor.

Contenders for the Presidency need have no fear of Donahey. He isn't a candidate and couldn't be nominated if he were.

Here's the reason:

He doesn't play golf and won't learn the game.

Interesting Side Lights on American Sports

Prevailing Styles Set by "Champs"; Miracle Performances New Order

By A Veteran Sports Writer

(C) Keystone View Co.

LOREN MURCHISON.

Wearing the colors of the Newark A. C., Murchison won all three special sprint races held in New York. He beat a quintet of the best sprinters in the country.

IT IS the custom in sport to follow the leaders. Holders of the titles set the style. When Maurice McLoughlin, the California Comet, was king of American tennis, all boys and novices in the game tried to develop the smashing drive, McLoughlin's strongest point. Now that William T. Tilden heads the game in this country, those who play try to learn a variety of strokes and practice strategy rather than power.

Since Babe Ruth has become baseball's greatest drawing card, ball players try for long hits. They are no longer content with hitting the ball into fair territory, but they want to "knock it out of the lot." The home run is the thing.

Gene Sarazen had no sooner won the national open golf championship than golfers were imitating his somewhat unusual grip.

Jack Dempsey's best punch is undoubtedly the left hook, and the majority of boxers are trying to develop one. Also, since Dempsey won the title, there is more body punching in both professional and amateur boxing than at any previous time. Dempsey is primarily a body puncher.

Charlie Brickley, of Harvard, showed what advantages kicking can give a football eleven, and many boys who paid no attention to kicking previous to Brickley's reign immediately devoted time and effort to this angle of play.

And so, down the list of sports, one finds that the prevailing style is due to the success of some leader who proved its value by going to the top.

Few things seem impossible in sport. A few years ago it was predicted that baseball would never see the season when an outfielder would have 500 chances in the 154 games comprising the schedule of major league teams. But last year Max Carey, the crack outfielder of the Pittsburgh Nationals, had 450 putouts, 28 assists and 19 errors, a total of 497 fielding chances. Carey played in 153 games and since he averaged more than three chances a game it is reasonable to assume that had he played in the other game he would have handled an even 500 or better, giving baseball a new "miracle" performance.

The argument between William T. Tilden and the American Lawn Tennis Association, which has provided much gossip and comment this winter, brings attention to doubles play in the United States. It has been many years since America has had good doubles play in tennis; our strength has always been in singles. Tilden pointed out this national tennis weakness several years ago and strenuously suggested that it be remedied. Lack of attention on part of the ruling body has been one of the causes for the defect in our play and no attempt has been made to strengthen this country in doubles competition. The break between Tilden and the tennis chiefs dates back to Tilden's criticisms of the manner of picking doubles teams for international competition. Instead of squabbling with Tilden the tennis executives could do a great deal more good by eliminating personal feeling in the matter and starting to give their support to doubles play. If the United States is to defend the Davis Cup, and the United States undoubtedly will, now is the time to form doubles teams and encourage practice and development of team play. It takes much work and time to develop a good combination for net competition.

P. & A. Photo

BERNICE PHELAN

Bernice Phelan, of Fresno, California, may be one of the United States entrants in the diving division of the forthcoming Olympic games. Miss Phelan, it is claimed, is the youngest full-fledged diving champ.

From the Argentine come reports that Luis Angel Firpo, who was kept from winning the world's heavyweight championship last September by a few technicalities that were foreign to him at the time, has grown fat. The big hulk that pounded Jack Dempsey to the floor once and also knocked him through the ropes within a space of less than three minutes of time, is said to have taken on excessive weight and some close observers of physical condition say he will not be fit to take the title from Dempsey when they have their second meeting this year. Be that as it may, the fact remains that when Dempsey and Firpo face each other in the ring a second time with the title at stake, the gate receipts will be more than any two baseball teams in the major leagues gather in an entire season.

East is East and West is West and the twain do not seem to get along when it comes to golf in this country. The past has been marked by a number of bitter disputes and undoubtedly the future will have its share. It is but natural that misunderstandings should arise when the territory of American golf is so widely separated. The major portion of the East fails to realize the extent of the game's progress and development on Mid-Western and Far-Western soil. This vast growth is centered chiefly in the last ten years and the West has felt that it should be given greater recognition and power in the administration of national golf affairs. In the meantime the politics of the game happen to be, frankly speaking, of only remote interest to the average golfer. He likes the game for the sake of the game, which is as it should be.

Pitching has lost a great deal of its effectiveness in the last ten years. Some say that pitching has gone back, that it has become a lost art and that pitchers no longer give serious thought to their work. This same group of critics, and among them you find some of the shrewdest men in the game, overlook one important item, and that is the lively ball. It is certain that Christy Mathewson in his prime could never have won the success he achieved had the lively ball been in use at that time. In 1913 "Dutch" Leonard, then with Boston, ranked twelfth among the American League pitchers in point of effectiveness, permitting an average number of 2.29 earned runs a game. Last season, exactly ten years later, Coveleskie, of Cleveland, led the same league in point of effectiveness with an average number of 2.76 earned runs a game, a record much below that of the twelfth pitcher of 1913.

Luque, of Cincinnati, with twenty-seven victories to his credit, led the National League pitchers last season in games won and Uhle, of Cleveland, was the American League leader with a total of twenty-six victories. Fifteen years ago Walsh, of Chicago, won forty games to lead the American League, and Mathewson, of New York, won thirty-seven to lead the National. Fifteen years after Walsh and Mathewson did this winning, we find few pitchers that get into as many as thirty-seven or forty games a year.

Football needs more room. Universities say that they can no longer take care of the crowds that want tickets to the varsity contests. Good coaches are increasingly in demand. Several changes have been made during the past year that have caused much speculation. Among these Howard Jones, who coached unbeaten teams at Iowa for two seasons but was not so successful last year, is going to leave Iowa next August and coach at Trinity, down below the Mason and Dixon's line. When it became known that Jones was considering departing from Iowa, several coaches in the Western Conference undertook to induce him to stay, an unusual procedure. Their motives were not entirely unselfish, for they believed that Jones' unusual personality reflected credit on all those associated with him in the Big Ten of the Middle West.

Jones, who came from Yale and who is a brother of Tad Jones, present coach of the Eli, is an exceptional sportsman among football coaches. To illustrate our meaning in a more impressive manner we shall relate an incident that occurred last autumn.

It was a few minutes after the Michigan-Iowa game. Michigan had beaten the Iowa giants through a mistake by one of the Iowa backs.

"A hard game to lose, Howard," said an acquaintance to Jones as he was leaving the field.

"Yes, it's hard to lose a game that way," replied Jones, "but that is the penalty of poor coaching. The fault is mine."

No sooner is the football season ended than writers, coaches, players and patrons of the sport begin picking all-star or mythical elevens. We have this selection in progress in every part of the country. Most of the All-American teams are picked by people that have never seen more than one or two of the men selected by them in action.

No sooner does this subside than the baseball enthusiasts begin picking their teams. January is the month when this hobby starts and it rides through the first three months of the year. By that time there is so much live baseball news coming out of the Southland that no time is to be had for mythical teams.

The fact that no one can definitely pick the best baseball or football team of all time makes this interesting autumn and winter amusement possible.

Hockey, played for years by eastern colleges and universities, has invaded the Middle West and several of the leading educational institutions are now represented on the ice. The game has made but little progress because its success depends upon the weather, also the caliber of the teams. Hockey in these colleges and universities is played on outdoor rinks, on natural ice. When the season of 1924 opened, not one of the teams had had more than four days' practice, and even four weeks is hardly long enough to get a hockey team into first-class playing condition.

Hockey is a fascinating game, one of the swiftest, most thrilling and colorful of all sports. To get a higher standard for collegiate hockey it is planned by several universities to build artificial ice arenas. Michigan is almost certain to have one next year and if not then, surely in the following year. This will enable the team to start practice before the football season is half through and insure improvement in play. Teamwork is as important in hockey as in basketball.

Tris Speaker set a new record for two-base hits in 1923. He made a total of fifty-nine which eclipses his own American League record of fifty-three, made while he was a member of the Boston Red Sox in 1912, and the total of fifty-six, made by the late Ed Delahanty in 1899. It is doubtful if another batsman will ever make as many two-base hits as will be credited to Speaker when he decides to retire from the game.

Speaker is one of the best batsmen of all time and one of the hardest hitters. Judging by the power he puts behind his drive one wonders that Speaker is not one of Babe Ruth's rivals for supremacy in hitting home runs. He explained it recently in a newspaper interview:

"It's all in the swing. I doubt whether there are two batters with the same stance and swing. Ruth hits so many home runs because he gets under the ball with his terrific swing. He raises it and produces mighty high flies.

"My swing is a waistline stroke. When I pull back my bat and go through I do not raise or lower the bat two inches until the swing is completed. Thus the bat instead of being raised similar to Ruth's goes out on a straight line.

"Many young batters make the mistake of not steadying their swings. If they would only practice when they are young for the follow-through stroke, with the bat leveled waistline high, they would improve their batting.

"Such a swing produces a line-drive hit. Few low-line drives ever go direct to an outfielder but invariably between outfielders or just inside the foul lines where they cannot be handled."

BRIEFLY TOLD

One giant redwood tree, recently felled near Portland, Oregon, yielded sufficient lumber to build fifty ordinary five-room bungalows.

The "shimmy," the "camel's step," and other modern dances are severely condemned by *Osservatore Romano*, organ of the Vatican, in an article indorsing the recent stand taken by Cardinal Begin, archbishop of Quebec.

Clark County, Ohio, in the future will use all copper found in liquor stills in repairing roofing and spouting on county buildings.

The chimes of the ancient church of St. Ulrich, at Augsburg, Germany, no longer mark the hours. After working steadily for fifty years the sacristan went on a strike because he had been paid but 4,000,000 marks from April to September—not enough to pay for the shoe leather he wore out climbing daily the 163 rough stair steps to wind the clock.

A block of coal nine feet high and four feet square was shipped from near Elkhart, Maryland, to Milan, Italy, where it is to be put on display at an industrial exposition.

Statistics show there is one officer for every eleven soldiers in the United States Army at present.

The old ship *Discovery,* which carried Captain Scott on the expedition which ended in his reaching the South Pole, is now being fitted for an expedition into the Far South to investigate means to save the whaling industry, which is being threatened by the extermination of the whales east of the Falkland Islands and South Hebrides.

Cattle will be killed by electricity by the Cudahy Packing Company, of Omaha, Nebraska. This will replace the present system of clubbing the animals over the head.

To prevent repeating in voting in San Juan, Porto Rico, each voter is shaved back of the right ear and is required to stick his finger in a pot of indelible ink. Formerly the voter was treated with indelible ink alone but an enterprising voter obtained a quantity of ink eradicator which he distributed to others.

A bill which would prohibit the teaching of Darwin's theory of evolution in the schools and colleges of Mississippi was introduced in the lower house of that state recently.

Coal is being mined in Spitzbergen in the Arctic.

The world's largest ball, measuring seven feet in diameter, is being pushed northwest from Chicago to the seaboard, south on the coast, across the continent and then back to Chicago to advertise and arouse interest in the citizens' military training camps. Army officials have said that the idea is to have the ball pushed along the route by students and their friends. It is expected that eighteen months will be required for the trip.

In the Baku fields of Soviet Russia the production of crude petroleum for 1923 increased more than twenty per cent over the previous year.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

"I am for an immigration policy truly American, drawn by Americans, administered by Americans, for the benefit of America today and in the future."—*James J. Davis,* Secretary of Labor.

It is rumored that a New York millionaire has sailed away in his yacht in search of buried treasure believed to have been buried on Cocos Island by Captain W. L. Morgan, the British buccaneer. The treasure is rumored to consist of solid gold and gem-incrusted ornaments, the ravished riches of the Inca Indians, looted from Peruvian churches.

Of the total population of the continental United States 10,500,000 are Negroes, including Mulattoes; 14 000,000 are foreign-born and 23,000,000 native-born with one or both parents foreign-born.

Isle Royale, located in the heart of Lake Superior, and containing 132,000 acres, may become a national monument, according to a statement from Secretary of the Interior Work. Evidence of prehistoric mining has been uncovered in three sections of the island. Harbors and bays range in depth from two to seventy-four fathoms. It is estimated there are 1,800 moose and 400 woodland caribou on the island. Also the only sharp-tailed grouse found in Michigan are located in this area. It has twenty-one inland lakes and several swift-flowing trout streams in the interior.

A hydroelectric project now under consideration contemplates the sending of power by wire from Isle Maligne on the Saguenay River in Canada, a distance of 550 miles, into New York City. It is believed that 2,000,000 horsepower will be developed here.

The total value of mah jong sets which Shanghai sent us in 1923 was $1,505,000, which was $176,247 more than the value of declared exports of hair nets.

The chief probation officer of the third Utah judicial district, including Salt Lake City and an area larger than the entire state of New Hampshire, has discovered from a perusal of his records that no boy scout who attended troop meetings regularly has ever been brought into his court.

The ex-kaiser is making ready his yard and garden for spring planting. He works among the rose bushes and other shrubbery, cutting away the vines of last season to make space for the blooms of 1924.

Ten "Dont's" for women political orators, given by the woman vice-chairman of the Republican national committee, are as follows: "Don't show off your best clothes; don't look like a bareback rider or a tinsel circus dancer. Don't wear pearls or dangly things around the neck. Don't wear a hat, especially one with feathers or flopping things on it. Don't show your feet or ankles. Don't yell at your audience. Don't learn your speech by heart, or read it from a written copy. Don't refer to your lack of time. Don't knock the other party."

Nineteen per cent of the people in Mexico are classed as pure white stock, forty-three per cent as Indian, and the remaining thirty-eight per cent as mixed. The total population is approximately 15,000,000.

The Gould seat on the New York Stock Exchange purchased thirty-nine years ago for $25,000 was sold recently for $85,000.

Hearses will be disguised as ordinary limousines if the opinion of the Associated Undertakers of New York carries throughout the country. Last year the association eliminated black gloves at funerals and voted to make its mortuary establishments bright and attractive. Enough gloom prevails in the world without somber hearses passing through the streets, according to the reasoning of the association.

Two thousand, four hundred and fifty-two men were killed by accidents in coal mines in the United States in 1923.

The government cable ship, *Dellwood,* with which the Army Signal Corps will lay the new cable to Alaska, has started from Seattle for London on the first 9,000 miles of a 41,000-mile journey. In London the cable will be loaded on the boat ready for laying. The *Dellwood* is equipped with the "Gyro-Pilot," a mechanical steering instrument which shows instantly the slightest movement of the ship's head off the course. At $1,000 a mile, the cost of laying the cable, it is estimated the new equipment will be paid for ten times over because of the true straight course it will follow.

A strange creature is the sucker fish which clings to larger fish and to hulls of vessels by means of "vacuum cups" at the back of its head, solely for the purpose of stealing a ride. It is found off the coast of Australia.

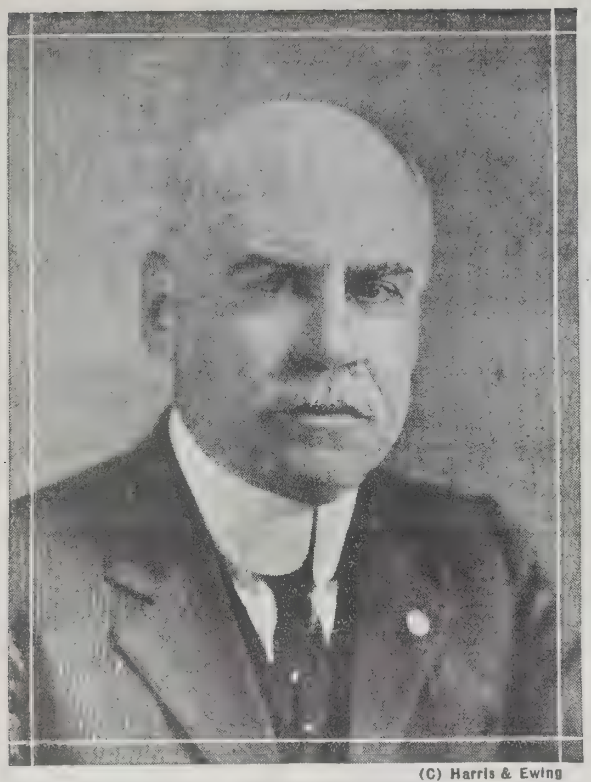
The Teaching of Statesmanship

A School for "Freshmen" Congressmen

By a Washington Observer



(C) Harris & Ewing

WILLIAM TYLER PAGE,

Clerk of the House, as Professor at the school of statesmanship.

ONE hundred and fifteen of the 129 new members of the 68th Congress met in the Auditorium of the House Office Building two days before the beginning of the session to get instructions in the art of statesmanship. William Tyler Page, clerk of the House of Representatives, was their "schoolmaster" and he proved an efficient one.

Two years ago Mr. Page conducted this "school" for the first time as an experiment. The idea has become so popular, because of its usefulness, that this primary "school of statesmanship" will be held each two years when new members are sent to Congress to enact laws for the nation.

Mr. Page's lecture occupied less than one hour of time. It was an intensely practical talk bearing on the routine work the "Freshmen" Congressmen would be expected to do and how to go about it, in making the start. After the lecture an hour and a half of time was spent in asking questions on the part of the "baby" Congressmen, which were answered by Mr. Page.

In his introductory remarks Mr. Page explained that "this is a symposium rather than a school." As a matter of fact the "class" very much resembled a class in a large university, in the lecture, as well as in the questions and answers. The textbook was "Page's Congressional Handbook" which the "Freshmen" were supposed to study after the "class" was dismissed. The conduct of the "class" was fairly good. There was some smoking of cigars and cigarets, in which latter the "professor" himself indulged after the lecture.

But "Professor" Page had promised the "class" some eats after the work of the "class" was over. While he didn't tell the "boys" that they would be rewarded at the elaborate buffet luncheon, spread out in plain sight in a far corner of the room, if they were good and had their lessons, perhaps it had the same effect as the rewards of the stern schoolmistress of their boyhood days. The class exercises lasted from eight to eleven-thirty in the evening. The splendid buffet luncheon after "class" proved to be a get-acquainted affair, much resembling a church social, minus the ladies and the preacher.

In his lecture Mr. Page declared that he had little patience with certain people who are always criticising Congress and its members. "There are 435 of you in the House, sent here by 110,000,000 sovereign people. You represent these people who sent you here by their votes. Whoever criticizes Congress and its members, on general principles, without some substantial reason, criticizes the sovereign people of this country," said he.

One member asked if his secretary could frank his personal letters and use the government-paid-for stationery. This brought up the whole question of the franking privileges of Congressmen, as to the mails and the telegraph companies. The telegraph companies send franks to all members each year. This entitles members to send telegrams at government rates, all the messages pertaining to the business of the government being charged against the government. As there has been some abuse of this, clerks of the Committee on Accounts now check up all the messages of members charged against the government, and those found to be of a personal nature are charged against the member at full rates. Members are entitled to send trunks and practically anything they choose through the mails. Congressmen have been known to send pianos and all kinds of household goods through the mails on their franks. Some years ago one member franked a Shetland pony for his children to use in Washington. While Mr. Page did not refer to these matters directly, he did explain with much elaboration about the franking privileges of members.

Among the many other questions asked are the following:

"How do two members "pair"?

"What is the "pair" for?

Mr. Page explained that when a Democratic member was to be absent and the House was likely to vote on any bill or question before the body, he would "pair" with some Republican member who would refrain from voting to offset the absent member's vote. A Republican member who was to be absent would do the same with some Democratic member. "Pairs" in the House are always put into writing and the roll clerk calls off the "pairs" daily. In the Senate the agreement to "pair" is not put into writing but is simply a verbal understanding between two Senators. The Senate having less than one-quarter the number of members as the House this plan is practicable in the Senate while it would not be in the House with its 435 members. The "pair" is a gentleman's agreement. If the member present violates his promise to "pair" with the absent one and votes, there is no penalty for so doing. It is very rarely that an agreement to "pair" is violated.

Other questions and the answers follow:

"How does a member introduce a bill?"

"In the handbook I have given each member here, you will find model bills, and the method of introducing them explained," answered Mr. Page.

"To how many copies of the *Congressional Record* is a member entitled?"

"Fifty-nine copies are allowed each member. You will find additional information in the handbook."

"Is there an Athletic Club and Turkish Bath free for members?"

"There is a Turkish Bath in the House Office Building for Representatives and one in the Senate Office Building for Senators, maintained at the expense of the government. There are no athletics furnished."

"Am I entitled to have my visiting constituents call and be received at the White House?"

"That is a matter you will have to arrange with the Secretary to the President in each individual case."

"When does a member-elect pass from that status to that of a member?"

"When he is formally sworn in, as provided by law."

"What is the difference between an order, a bill, a resolution and a concurrent resolution?"

"When the House commands, it is an 'order.' But fact, principles, and their own opinions and purposes are expressed in the form of resolutions. A concurrent resolution is for a recess of Congress, or for adjournment of Congress *sine die,* in which both the Senate and House concur."

"Please tell us about the privileges of members at the Congressional Library and at the Library in the Capitol Building."

"The House has a library of law books and statutes for the immediate use of its members. At the Congressional Library members have special rooms reserved for them to which the general public is not admitted. Clerks are there to assist them in getting the books they want and help in research."

"What allowance do I have for clerk hire?"

"Each member is allowed not to exceed $3,200 a year for hire of his secretary or clerk and $125 a year for stationery. Most members have both a secretary and a clerk. The office rent, of course, is free to the members. Until very recent years members were allowed $1,500 a year for clerk hire.

"Does a delegate to Congress from the territories, and resident commissioner, have the same privileges as members and get the same salary?"

"Alaska and Hawaii each have one delegate in Congress. The Philippine Islands have two resident commissioners, and Porto Rico has one. They receive the same salaries as members. While they have the privilege of the floor, they are not qualified to vote. They are given assignments on the Insular Committees. They are sent every two years by a vote of the people in Porto Rico and by the legislature in the Philippines."

"Is the mileage the same for all?" asked Pedro Guevara, the newly elected commissioner from the Philippines.

"The two commissioners from the Philippines are each allowed $2,000 mileage a year to cover all expenses of traveling. The delegate from Alaska is allowed $1,500 for this purpose each year. From Porto Rico the commissioner is allowed actual traveling expenses each year. From Hawaii the delegate is allowed twenty cents a mile, or ten cents a mile each way, for traveling expenses, the same as members from their states. The member from near-by Congressional districts in Virginia or Maryland, fifty miles from Washington, gets $10 mileage for all traveling expenses, while the member from California would get in the neighborhood of $600 each year. The actual distance by the shortest route is the basis for mileage allowances."

"Have Congressmen immunity from arrest?"

"The Constitution grants to members privilege from arrest under certain conditions. Senators and Representatives shall in all cases, except treason, felony, and breach of peace, be privileged from arrest during their attendance at the session of their respective houses and in going to and returning from the same, and for any speech or debate in either house they shall not be questioned in any other place. The words treason, felony, and breach of the peace, however, have been construed to mean all indictable crimes."

"When a member dies, does his widow or heirs draw the salary and mileage due him?"

"The widow or dependents get one month's salary. In addition to this the widow or children are given a year's salary, usually, which is granted by special legislation in each case."

"What persons can be admitted to the floor of the house?"

"Rule 32 provides: The persons hereinafter named, and none other, shall be admitted to the hall of the house or rooms leading there, namely: The President and Vice-President of the United States and their private secretaries, judges of the Supreme Court, members of Congress and members-elect, contestants in election cases during the pendency of their cases, the secretary of the house, the secretary of the Senate and sergeant-at-arms of the Senate, heads of departments, foreign ministers, governors of states, the superintendent of the capitol building and grounds, the librarian of Congress and his assistant in charge of the law library, ex-members of the House of Representatives who are not interested in any claim or directly in any bill pending before Congress, and clerks of committees when business from their committee is under consideration; and it shall not be in order for the speaker to entertain a request for the suspension of this rule or to present from the chair the request of any member for unanimous consent. It is very rare that a foreign minister avails himself of the privilege of the floor, which is simply a courtesy. Such foreign officials usually prefer the diplomatic gallery, for observing the sessions, which is reserved specially for them.

"What constitutes a quorum?"

"A majority of each house constitutes a quorum. A smaller number than a majority may adjourn from day to day and compel the attendance of absent members. A quorum of the 68th Congress, as to the house, is 218."

"What is the drafting board or drafting committee?"

"The drafting board was created in 1915 to assist the committees to draw up important bills to be introduced. Individual members are not supposed to call on the drafting board to assist them in drafting bills and resolutions. The Senate also has a drafting board and members of that body may call upon the board to draw up bills for them or assist them. The men composing these

"Rookie" Representatives attending a "symposium" in the House Office Building, Washington, by William Tyler Page, Clerk of the House. A rapid fire of questions was answered by Mr. Page.

World Action to Suppress the Opium Menace

League of Nations Brings About International Co-operation; Control of Production and Manufacture Promises Relief

By WILLIAM ATHERTON DU PUY

IN INDIA, Turkey and Persia grow wide fields of white poppies looking upon azure skies, and into these fields at carefully chosen moments in the plant's development swarm many groups of dark and somber men and women. They pluck the unripe capsules of these poppies. possessed of weird influences destined to be felt from Vladivostock to Lisbon and from Boston to Zamboanga, dry them and pack them into black gummy balls. Every year when the season is over it is found that the production of the dried poppy capsules from these combined nations amounts to some 1,500 tons. It is opium. It constitutes the world's crop of that drug for the year.

Between the poles there live a billion and three-quarters of persons and in so great a number there are always many in the grip of painful afflictions, many facing the necessity of subjecting themselves to the surgeon's knife, many so placed that it is deemed advisable that resort be had to the juice of the poppy to relieve them of their agonies. To them the white flower of Turkey, Persia and India carries surcease to pain. So perfected are the agencies for the dissemination of palliative drugs that there are few individuals beneath the sun who cannot be reached by them.

And when this drug has served this medicinal purpose wherever men and women suffer, it is found that one hundred tons of each year's production has been consumed. One hundred tons covers the annual world requirement of opium for medicinal use.

The Additional 1,400 Tons

THERE remains of the annual crop 1,400 tons of opium, the most malignant package of merchandise that finds its way into the marts of men. That 1,400 tons drugs and degenerates a whole people as numerous as the hordes of India. It leaks illicitly across the borders of China where the intensity of the struggle for existence, the monotony of a life with no diversions, the Oriental propensity for the use of drugs, creates a limitless market. It whips the British Empire and the American Government, which have fought it and lost steadily for two decades, and which today have as many broken addicts, men and women, lost to usefulness, decency, love, as there are people in three cities like Washington. It has been the cause of international conventions which have had no more effect than whistling against the wind. It is today the cause of an attempt in Geneva to bind fifty great nations to simultaneous action to suppress it, fifty to win through organization where each standing alone has met naught but defeat. Fifty nations are organizing for common action in suppressing 1,400 tons of opium.

So ever present has been the menace of drug addiction for the past decade that this generation has forgotten that it is a new danger facing the peoples of the world. In the days of our fathers the use of drugs other than as medicine hardly existed except in the Orient. India had used opium for centuries, and had, as a commercial venture, pushed it upon the resisting Chinese. It was not until the present century appeared that its abuse became material among the western nations. The Chinese, who always smoked their opium, had succeeded in closing their borders as a first-rate market for the Indian product. It was then that India learned how to convert the raw opium into alkaloids through a process of refinement, and began to push it as morphine, codeine, heroin, into the western world. The improper use of these drugs is largely a growth of the past two decades.

Cocaine – Morphine's Ally

MORPHINE breeds that frame of mind in which comes a blissful disregard, when nothing matters. The Oriental under its spell dreams blissfully, but to the Anglo-Saxon, oddly, come unpleasant visions. The habitual use of morphine is a secret vice. The morphine addict hides his sin. In this he differs from the user of cocaine. The morphine addict takes his "shot in the arm" in seclusion, while the cocaine maniac "sniffs the snow" in company. He goes out into the byways and induces others to acquire his addiction. He waits with cunning for an opportunity to pin his vice on the young or the weak of character.

Cocaine, we may pause to explain, is a habit-forming drug not derived from opium but supplementing it as a menace. It is made from coca leaves secured principally in Peru and Lava. There are unlimited quantities of coca leaves in the world. One pound of cocaine makes a thousand doses. How many doses would a hundred tons of it make? Yet there is a firm in Philadelphia which has received shipments of coca leaves amounting to 1,000,000 pounds a year, and which would be glad to take orders in these quantities. Thus does the suppression of cocaine become a part of the campaign against opium as the chief offender, but its importance as a foe is but one to ten when compared with it.

It develops that the responsibility for the traffic in morphine and cocaine does not rest entirely with the countries that produce the raw materials, but also upon those which manufacture them into their more refined products.

Opium in the raw state is not the drug that is degenerating millions. It is opium in the form of its alkaloids that is doing the mischief. Laudanum, a drug much used a generation ago, is made from raw opium, but its use has largely passed. Raw opium is smoked by the Chinese, but this phase of the problem is not of major interest to western nations. It is opium, in the form of morphine and in the form of that still further refined drug, heroin, that is so extensively used in the western nations.

The conversion of the raw opium into its alkaloids is a technical, scientific and quite complicated manufacturing task. It is so difficult, for instance, that the Chinese have never mastered the process. It is a thing which is chiefly done by the nations of the west. America leads the industry. Japan, England, Germany, Switzerland are very active in it.

The manufacture of cocaine from coca leaves is an even more difficult process. Here also the manufacturing is chiefly done by the advanced nations. One factory in the United States makes more cocaine than is needed for the supply of the legitimate needs of the world. The process is so complicated that it could not be carried on in secret. A realization of these facts makes it impossible for the advanced nations to place the responsibility for the growth of drug addiction on those countries that produce the raw materials. The manufacturing plants are in the western nations, and their existence is well known to them.

Even with these facts of the source of habit-forming drugs in mind, with a knowledge of the frightful results that are coming from their use, and with ninety-nine persons out of every hundred between the poles in favor of their suppression, drug addiction is everywhere increasing at a frightful rate. In the face of these facts, it may well be asked, is not the ingenuity of man sufficient to rid itself of this thing which is so grievously injuring the human race?

National Co-operation

THE answer is that no nation acting alone can get rid of habit-forming drugs, but possibly they can if they will work together. If the United States, for instance, should establish control over her factories which make the alkaloids of opium and cocaine of coca leaves, and should it prevent their illegitimate traffic in these products (a thing which she does not do), the profits from smuggling them in from the nations which still produced them, and the virtual impossibility of preventing it, would result in a continuance of quite abundant supplies. The bulk of the drugs is so small that a method of introducing them can always be found. But if the United States actually controlled the manufacture and distribution within her own bounds, and if other nations did the same thing, the traffic could be suppressed. It could be banished from the world.

Just this thing is well on the way toward accomplishment. It is coming about because a way has been found to secure common action among the governments. The League of Nations at Geneva is proving to be a medium through which common action can be secured. For some years it has had an opium commission with a technical staff which has been studying the problem from a world standpoint. The United States has been co-operating with this commission, so its scope is actually world-wide. A delegation headed by Representative Stephen G. Porter went to Geneva, sat with the commission, insisted on the American viewpoint and got its way. That commission returned to Geneva for further conference during the meeting of the League Assembly, insisted on progress toward actually clamping down the world lid, proposed a world conference to finish the job, which proposal was enthusiastically accepted. There will be a preliminary conference of nations directly interested in the opium problem of the East and later the big world conference. Hence, since the preliminaries are pretty well out of the way, history stands to be written.

Two Solutions Offered

THERE are two methods of approaching the problem. One is through an arrangement for limiting the production at the source. If the world needs one hundred tons of opium and 1,500 tons are produced, the cure lies in reducing the production. India, Turkey and Persia produce the bulk of the opium of the world and in about equal amounts. If each were allotted a mere thirty-three tons that it might produce, the question would be solved. There is no authority by which other nations may go into Turkey, Persia or India and give orders as to what they shall do within their own borders. This is an obstacle to be overcome.

There is another method, a control of the channels through which opium flows. This control will be necessary even if control of production at the source is attained, for it will be necessary to see to it that the opium legitimately required does not get into illegitimate channels.

The first concrete advance toward control was made when the commission made its proposal to establish an international importation certificate. If a British merchant wanted to import a ton of opium, or an ounce, from Persia, he should be required to show a certificate from his government authorizing that importation. So should any other citizen of any country entering into this agreement. If he did not have his certificate, Persia could not let him have the opium. It would be the business of the British Government, or any other government, to assure itself that its citizen was to make a proper use of that opium before it issued the certificate. He should be made to account for every ounce of it. He should be made to give bond for such an accounting. This simple device, it seemed, would keep track of the flow of opium about the world. Of course, raw opium might be smuggled, but there was another check on that, for the opium of the drug user must pass through a factory for its conversion into alkaloids.

An International Experiment

FOR a while the certificate plan seemed doomed to failure because Turkey and Persia, producing countries, failed to ratify it. The people of those nations had no interest in opium except as a commercial venture. They were not addicted to its use, as were the Indians. They made money out of opium and they intended to continue its production.

Then a very interesting international experiment was tried. A large group of organized nations decided to bring pressure on a small group of recalcitrants. Turkey and Persia would not adopt the certificate system.

Very well. Merchants of other nations should be allowed to buy only through the certificate method. They therefore could not buy from Persia and Turkey at all. They must find their opium elsewhere. Turkey and Persia saw their opium business entirely disappearing. They signified their willingness to ratify. So does this certificate scheme promise to become a dyke which will keep opium within legitimate channels. It will not be water-tight at first, but in time its flaws should be mended.

The experts hold, however, that control of opium and cocaine, beginning thus, are as much a domestic as an international task. While raw opium is produced in the East, the drug in the form used and the cocaine are manufactured inside the western nations. That manufacture must be controlled, or the makers are likely to find a way of procuring the raw materials. Certain principles of this control are quite generally accepted by students of the problem.

Controlling Manufacture

IN THE first place, factories must be under state control. If they are not, the temptation is so great that a way will be found to make the stuff for illicit use. There are plenty of factories in America today, and in Britain, Switzerland and Japan, that are making these drugs without any government hindrance. Controlled factories would be supplied by licensed importers. Every ounce received would have to be accounted for. The drugs would be sold by the manufacturers only to the licensed dealers, and in lettered and numbered packages that could be traced and identified. The dealers would be required to account for every ounce. They would be required to explain any package found in the illegitimate possession of any individual. Thus would a record be kept of each particle of opium from the time it left the country where it was grown to the time of its actual consumption. Not only would each person receiving opium be required to have a certificate, but he should be required to give bond that he would make proper use of the materials he secured, and render a satisfactory accounting.

This all looks quite complicated, but it is not so because the quantities of drugs used legitimately are not sufficiently great to make the machinery large. All the cocaine needed in the United States, for example, could be made by one factory of no considerable size. All the opium could be refined in one plant. The best plan, it is held, is to make this production a government monopoly. Failing this, the government should supervise the factories. If production was thus controlled in the individual manufacturing countries, there would be no source of drugs from which the smuggler could be supplied, and it would cease to be possible for him to operate. The elaborate agencies now maintained to combat him could be abandoned.

The program being followed by the opium commission is to push both these programs, to make each upplement the other and have one as a protection against habit-forming drugs in case the other fails.

England Suffers Economic Breakdown; Unemployment and High Taxes Prevail

Employer and Employe Alike Suffer; More Than a Million Men Now Out of Work; New Industrial Methods Would Solve Problem

By SAMUEL CROWTHER

THE country hardest hit by the war is England. No battles were fought in England. The German Zeppelins, with supreme foolishness, dropped great numbers of bombs on London, killed a few women and children, and caused a rather considerable amount of damage. But as war expenditures go, the amount of damage was trivial.

The really devastated sections of Great Britain are the mill towns of Lancastershire and Yorksnire, the shipyards of the Clyde, the fine steel and cutlery industries of Sheffield, and the docks of Liverpool and London. In these once busy centers of work and trade reigns the silence of the grave.

A building razed by a bomb may be rebuilt. The problem is simple enough. The only question is getting the money for the material and labor. But these British factors, shipyards, and docks are perfectly equipped for work of the kind that Britain did before the war. The labor is there waiting for the sound of the whistle. Only customers are lacking. The people who bought from England are no longer buying, because they have not the money to pay the prices that the factories ask, and thus the ships which would carry the goods are idle, and in turn the shipyards are idle. The problem of reconstruction here is far from simple.

Million Unemployed

I HAVE overdrawn the picture a little. There is some work in England, but the amount as compared with the normal volume required to support the country is so small that it can almost be dismissed. More than a million men are out of work. You cannot stay in England a week without running into some kind of a pathetic unemployment demonstration. The men who are at work are only a little better off than those who are without it, for the wages of productive labor are considerably below the cost of living, and so strikes are an everyday occurrence. We have had periods here in America when men thought lightly of their jobs and left them easily. They knew other jobs were waiting around the corner. The British workmen hold their jobs lightly because it does not seem worth while to work for almost nothing. As a skilled engineer (what we call a machinist, the British call an engineer) said to me:

"I served my apprenticeship. I am a first-class workman. But if I get a full week's work—and I have not had a full week's work for two years—I shall not earn as much as a railway porter who just carries luggage and does not need any skill at all. What is the world coming to when the wages of a skilled worker are below those of an unskilled laborer? If it were not for the unemployment doles, which my two daughters have been drawing ever since they were munition workers during the war, our family would starve to death. Why can't this country provide a living for us?"

Questions like that are being asked all over England. They are not being asked very patiently. The workers are extremely dissatisfied, and they are rather easy prey for the social quacks who tell them that all of their troubles are due to the failure of the capitalistic system. The white-collar men—the vast army of clerks who man the offices and the retail shops—are actually worse off than the manual workers because their wages are in most cases no higher than those of the factory hands and at the same time they have to keep up something in the way of appearances. They do not know where they are at. A great many of them are inclining toward Socialism and it is their vote which determines the balance of power.

The Party Situation

THE English Labor party is not strong enough of itself to gain power nor to keep it. The voting backbone of the Labor party is comprised of the strongly unionized hand workers. The Conservative party has its power in the farmers and landowners generally, strengthened by a certain number of bankers and professional men. The Liberal party finds its greatest strength among professional men and salaried people. It is essentially a middle-class party. But for the present a very considerable section of the middle class has shifted to the Labor party, not that any great sympathy exists between them and the trades unions—in fact the hostility is quite bitter—but simply because the principles of Ramsay Macdonald and his followers are about the only principles which have not yet been thoroughly tried out. It is part of the English political heritage to try almost anything in politics once!

Take another side. While in England, I met and talked with most of the industrial leaders. Only one of them said that he was making any money. The others were living on capital. That is to say, although they made a certain amount of goods and sold some at a profit, these profits were not large enough on their small volume of production to pay the fixed charges. They were operating on a loss—which means that they were operating either on capital or on borrowed money.

None Are Prosperous

THE banks are advancing considerable sums on foreign loans, but this is not a sign of prosperity. Money hunts the world over for employment and when it cannot find it at home it goes abroad. That is why English money is going abroad. The wealthy landowners, the titled men, who have lived as did their fathers before them on the income from lands, are selling their estates whenever they can find purchasers. The English newspapers are full of offerings of small and large estates; for estates which used to be sources of great revenue are now items of expense. The local taxes are so high, the price of farm products so low, and the cost of farm labor so high that a tenant farmer cannot pay his landlord a rental which will take care of fixed charges, and so the landlord sees what was once an income turned into a liability.

The poor in England are very poor, but they are not being ground down by capitalists. The capitalists themselves are being ground down. No one is prosperous. The case is not one for political remedies. The Labor government, which has finally come into power under Mr. Ramsay Macdonald as prime minister, arrived with a series of remedies guaranteed to cure anything. It was proposed gradually to do away with the profit system and to go on a Socialistic basis. No one thought to observe that there were no profits to do away with. Then also it was proposed to make a capital levy. The difference between a levy on capital and an ordinary tax is only one of degree. Our inheritance taxes are capital levies. The Labor proposal had a sound basis. England's public debt is very large. The idea was to get rid of a portion of this debt by a sliding scale levy on capital which would affect the man of moderate means lightly and cut deeply into the resources of the wealthy. The English Labor party is a political body, and although trades union funds are used for election purposes, the party itself is purely political and most of its leaders are politicians who have never been workers. Ramsay Macdonald, for instance, lives on an income inherited from his parents. These leaders know that a rich man's fortune does not consist of money kept somewhere in a chest. They know that what is called capital is only in a small degree money and is mostly in lands, buildings, and machinery.

Too Much Government

THE statistics worked out that were the capital levy made, the decrease in revenue-producing sources would be so great that thereafter taxation could hardly produce enough money to pay the expenses of government. They found they could kill the goose that laid the golden egg, but they could not discover any way of making a dead goose lay an egg. So, instead of a great, radical, sweeping program, the Labor government of Great Britain has decided to postpone its measures until a more propitious time and is doing exactly what its Conservative predecessor did—marking time.

The real trouble with England is, that like most foreign governments, it is suffering from far too much government. To the heavy burden of the war was added the tremendous burden of the peace. England is essentially a workshop and a trading center. The population is of course much larger than the food-producing capacity of the country. Food has to be imported. But the population could not have grown beyond the food-producing capacity, had it not been for the coal deposits. Having coal and iron, England could support a big shop organization. The vessels could go out laden with coal and bring back foodstuffs and cotton and wool. A country cannot support a merchant marine unless the ships can have full cargoes both ways. England could do that and thus become a shipping country and London become a financial center by the clearing through its banking houses of the bills for the cargoes. Later it began to insure the vessels and cargoes, and shortly became the maritime insurance center of the world.

These shipping facilities, combined with an early taking up of the steam engine, gradually made England a weaver of cotton and woolen textiles, a builder of machinery and engines, and a producer of tools. Here in the United States we have grown because of the development of the home market. Foreign trade has always been a side issue with us. In England the home market is the side issue. This is an extremely important point and the whole industrial structure of England is built on it. It is the reason behind British free trade—although the fundamental conception of free trade rests on a different basis.

English manufacturing grew up almost without competitors. Until the latter part of the last century English machinery and methods were far ahead of those of any other country. Wages, however, were low. All the evils of the factory system—the labor of children, the crowding into slums, and so on—originated in England and the English workman never had a fair chance until the war. The idea that high wages could be translated into low cost production has made but little headway in England because tradition has ruled both employers and employes. The English labor unions early adopted the policy of restricting production. If an employer wanted to put in a machine which would do the work of ten men, he would be allowed to put it in only if he employed the ten men about the machine—even though the ten had to sit around the machine and watch it. It meant nothing to the employers to build up buying power among their own people, for they did not sell to their own people. So, while the voluntary restriction of production makes high wages impossible, for wages can be paid only out of production, yet it is easy to see how the worker felt that this restriction was a measure of self-defense.

The Burden of Taxation

THEN came the war with its big wage rates, paid not out of production but out of bond issues. After the war, Lloyd George, in the process of the demobilization both of the army and of the munition workers, put in effect a policy of what were supposed to be temporary unemployment allowances. The local authorities supplemented these allowances. The government war controls continued because once a bureaucracy gets its fingers into business it acts like a small boy in a jam jar. The expenses of the government were being paid partly by taxation and partly by raising fresh loans.

Taxation was heavy, but its actual burden was light because of currency inflation. England was printing money. Before the war England used gold sovereigns and Bank of England notes with a full gold covering. During the war the gold was withdrawn from circulation and the treasury printed notes. Paper money, freely issued, causes prices to rise and with them profits, so that taxes do not bear heavily. England had a boom, just as we did in 1919-20. Then England started to deflate. It was not wholly a voluntary process. The Continental countries had been buying largely on credit, and all of them reached the end of the rope at about the same time. Disturbances in India cut into England's biggest market for cotton goods, and in addition many Indians who would have liked to buy could not pay inflated English prices.

Then things in England began to look black. Mills and factories began to shut down, and once more in desperation the government began to extend its unemployment doles and to institute government work—not because it was needed but to give employment to men. These tremendous government expenses had to turn up in still heavier taxes, and so today we find English production so heavily taxed that a yard of goods cannot be sold for enough to pay the costs of raw material, manufacturing and taxation. For of course every penny of taxes, directly or indirectly, has to be paid out of what is produced.

New Production Methods Needed

THE only possible method for a country to get out of a hole of this sort is to introduce mechanical means which will cut down the costs of production. But neither the employers nor the employes understand such methods of production. The whole country hopes against hope that someone will discover a new way of counting by which two plus two can be made to equal six. The labor unions try to raise wages without raising production and all they accomplish, when they do get their advances, is a raising of price levels which makes the new wages no better than the old ones.

The situation is serious—much more serious than most people imagine, because the British do not advertise their troubles. No one knows what the eventual outcome will be. We only know that a factory which cannot produce at a price its customers can pay must either reorganize or go out of business. A nation cannot go out of business. At the same time, the reorganization of a nation is a matter of years, not of days.

Joseph C. Lincoln Has Reclaimed Cape Cod

Novelist Reconstructs Life of Seafaring Forefathers

By FRED L. HOLMES

CAPE Cod, on the south side of Massachusetts Bay, projects an upward curving finger of sixty miles of headland into the Atlantic Ocean. It is a point with only two directions, for at places the peninsula narrows to about a mile, but widens at its base to nearly twenty. Barren spots and sand dunes are broken by cranberry bogs and marshes, the cultivation of which is the principal agricultural industry. The tides ebb and flow about its shores and the pungent odor of seaweeds and salt breezes waft in from the billowing ocean.

Seafaring men for centuries have made Cape Cod their home. Up to half a century ago there were as many "captains" on this neck of land as there were "colonels" in Kentucky. Before the seventies in the towns and villages practically every house was occupied by a sea captain, active or retired, or by a captain's widow or near relatives. All this was before the day that the steamship drove the old square rigger out of business.

Now all has changed. Residents no longer walk with a sea roll. Fences which inclosed their former trim lawns and yards have disappeared. Gone are the hitching posts and carriage blocks by the front gates. The majority of the houses are open now only in summertime; then they were occupied all year. They who come now regard them as playthings for a few weeks in summer. Then they were the homes of men who traveled all foreign lands, gathering a wealth of curiosities which turned their front parlors into museums; the home of sturdy men and women who loved their homes and meant to live in them while on land—as long as life was there.

Joseph C. Lincoln, the novelist, has rediscovered Cape Cod of seafaring days. Born on the Cape, at Brewster, February 13, 1870, not many miles from the spot where the Pilgrim Fathers landed after their memorable voyage just two hundred and fifty years before, the perfume of the green salt meadows, the aroma of pines and bayberry, the scene of fishing boats and dripping nets, were a part of his boyhood existence.

"Well, I ought to know the folk of Cape Cod," declared the robust, ruddy-faced, jovial Mr. Lincoln. "I was born there, lived there all my youth, and, since leaving, I can't remember ever having missed visiting the Cape Cod during the year. Sometimes I've only gone there for a few days, often for months, but I always go back. I suppose that it's the call in my blood."

For a time Mr. Lincoln sat comfortably, as if his mind were ruminating the many stories told by the old sea dogs upon returning from long trips to foreign shores; visualizing the social life of the Cape Cod of half a century ago.

"My father was a sea captain," he finally continued. "So was his father and his father before him, and all my uncles. My mother's people all followed the sea. I suppose if I had been born a few years earlier, I would have had my own ship. But when it came time for me to earn a living, the steamship was driving the old square rigger out of existence, and the glorious merchant marine that we had built up in the first part of the nineteenth century was fading into tradition. So I went to Brooklyn to live and become a broker."

A year after the birth of the boy, Captain Lincoln died of a fever in Charlestown, South Carolina, and upon his mother fell the burden of rearing the child. She was a tender, self-sacrificing woman, of whose devotion and inspiration many a poem, written by the son in later life, gives detail. She gave the boy a freedom of field and shore that was to lay the foundation for his success in later life.

Roaming over Cape Cod, young Joseph came to know the village oracles and their legendary tales; the old sea captains, gathered around the stores where they related tales of their adventures; learned the life of the stagecoach driver on the line from Harwich to Chatham, the vigil of lighthouse keepers, the ways of grizzled fishermen and the homely philosophy of the post-office prophets and country merchants.

JOSEPH C. LINCOLN,

Novelist, humorist and philosopher.

Unknowingly, the strange vernacular of these people was assimilated—odd phrases of the sea; eccentric customs characteristic of the people themselves. Curt words, like, "hev" and "hed" for "have" and "had," are still used by him, when the emotions of the occasions toss him from his more stable moorings. And through his books are to be found colloquial terms of the sea permeating their every page, like the scent of roses that still climb over the lattice doorways of the old residences. When an old sea captain dies, he "slips the cable"; or in actual life may be characterized "as graceful as a brick sloop in a head tide." Thinking is "dragging a seine through one's head." Checking a disturbance is "lam the crew over the head with a handspike"; and home is "a snug harbor under my lee"; broken legs are "splint timbers," and a guest in the house is "a passenger in your spare state room." These are a few of the hundreds of similar expressions gathered from the language of the Cape.

"As my mother and I were alone in the world," observed Mr. Lincoln, when pressed for more of his early reminiscences, "and I was to be a business man, it was decided I had better not waste time going to college. So, as I said before, I went to live in Brooklyn and entered a broker's office. It was not work to my liking. I wanted to draw—to be an artist—and eventually under the guidance of Henry Sandham, whose familiar signature was 'Hy,' I went to Boston."

"Was there opposition by the financial firm to your quitting?" was asked.

"I have always felt that they were fully as glad to get rid of me as I was to leave them," came the reply.

Doubtless it was this experience which a quarter of a century later prompted him to write the novel, "Galusha, the Magnificent." It portrays the mental torture of a bank clerk who dislikes his employment. The temperamental, impractical Galusha is dragged through the realms of finance only to escape to the fields of Cape Cod as if he were shunning embellishments of fiction and trials mellowed through the years. Nevertheless, to this day, one who talks to Mr. Lincoln cannot but feel impressed with the sincerity of his belief that it was this escape from the countingroom that made his literary career a possibility.

Always artists have found it difficult to dispose of their pictures. Lincoln fared no differently. To make a painting sell better, he struck the singular idea by writing a verse or a joke to accompany each painting. Soon the verses were selling the pictures. Editors who learned of the quaint, witty stories about the Cape Cod people began to demand them.

"Did you give up painting?" was asked.

"It was this way," interrupted Mr. Lincoln. "Shortly after this, Sterling Elliott, who was editor of the League of American Wheelmen, sent for me and offered me a position as staff illustrator. I accepted. That was in the days when everyone rode a bicycle and the journal had a circulation of over 125,000 weekly. My verse and illustrations became known to a fairly large public.

"In the meantime I was back in Brooklyn, had married a Massachusetts girl, and was doing considerable verse for various publications. They were mostly poems in dialect, the vernacular of the Cape, and I had almost unconsciously turned to the Cape for my inspiration. I sensed the fact that there was a subtle humor in the men and women of my own stock. Then, too, they were unusual characters and the homes that made a background for their lives were picturesque to a superlative degree.

"It was about this same period that I wrote my first story. I went again to the Cape for my inspiration, drawing the type of man I know best for my central character, and the story sold."

That was the beginning of his career as a fiction writer. In 1904 his first novel, "Cap'n Eric," was published. It fixed his ascent in the literary firmament. The story is the tale of three old sea captains, who, despairing of their joint efforts as housekeepers, advertised for a wife. Although it is nearly twenty years since this volume appeared, it is still in demand, just as there is a continual call for "David Harum," the old horse-jockey banker of Western New York, stories of real home-people lives. "Cap'n Eric" has gone through many editions.

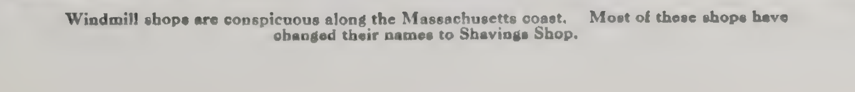
A score of books were to follow in almost annual succession: "Mr. Pratt," "The Old Home House," "Partners of the Tide," "Our Village," "Cape Cod Ballads," "Cy Whittaker's Place," "Keziah Coffin," "The Depot Master," "The Woman Haters," "Cap'n Warren's Wards," "The Postmaster," "The Rise of Roscoe Paine," "Mr. Pratt's Patients," "Cap'n Dan's Daughter," "Kent Knowles, 'Quahaug,'" "Thankful's Inheritance," "Extricating Obadiah," "Mary 'Gusta," "Shavings," "The Portygee," "Galusha, the Magnificent," "Fair Harbor" and "Dr. Nye of North Ostable."

Hundreds of letters come to the author in which the reader declares that he knew the old sea dog who figures in a certain novel in real life and recognized him at once.

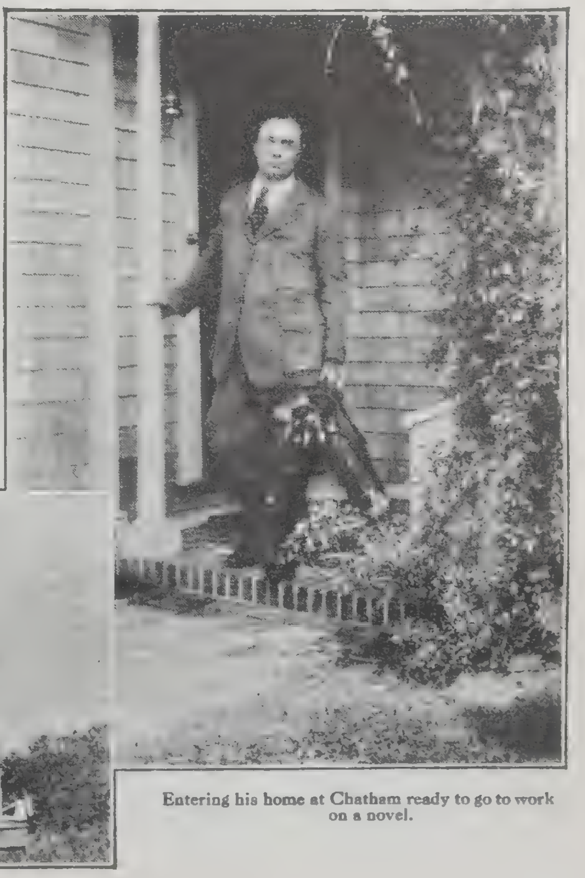
"Nevertheless, they are wrong," declares Mr. Lincoln, "for no character of mine has been, if I could prevent it, a portrait of one living or who has lived. I have endeavored always to be true to type, and in writing of the

(*Concluded on page 14*)

All the people of Cape Cod are interested in windmills and Joseph C. Lincoln is no exception.



Windmill shops are conspicuous along the Massachusetts coast. Most of these shops have changed their names to Shavings Shop.



Entering his home at Chatham ready to go to work on a novel.

Haleakala, the Enchanted

A Trip to Hawaii's House of the Sun, the World's Largest Extinct Volcano

By FLORENCE MARGARET LEE

IT WAS not a case of "see Naples and die," but see Ha-le-a-ka-la and almost die! For Hawaii has not yet built an automobile road up to the rim of the largest extinct volcano in the world. No rubberneck wagons or picture post cards or Cook's tourists are there to greet one at every turn; one finds only nature in her most magnificent mood.

Four of us in Honolulu planned to climb to the top of Haleakala. Elizabeth, a pretty young widow, and I went ahead; the other two were to join us later. Little did we suspect when we boarded the small inter-island steamer about ten o'clock in the morning that we were to cross in the wake of a storm, for the day was dazzlingly clear, friends were at the steamer with flower leis, the wreaths with which Hawaii drapes her departing travelers, and all seemed auspicious.

"This is much worse than the English channel," murmured Elizabeth, when we were about half an hour out. Glancing around I saw the familiar seasick color blanching her face. And that was the last that the deck saw of Elizabeth until the late afternoon. Most of the passengers were among those missing at luncheon. I, happily ignorant that my ordeal was to come on the mountain, was one of the few to enjoy the rough voyage.

Landing on the island of Maui after the storm was thrilling. The steamer had to stop outside and land her passengers in lifeboats on a pier built out in the sea, since the hills at this place rise sharply from the water's edge. Powerful Hawaiian sailors rowed the lifeboats to this pier, skillfully maneuvered so that just as the boat, carried on the crest of a wave, was level with the top of the pier eight feet above, two of the men would swing a passenger to the pier. Their skill was marvelous and they tossed us, who weighed no more than one hundred and twenty pounds, as easily as a ball, but it was no place for a fat dowager!

Automobiles were waiting, and with other steamer passengers we drove to Wailuku twenty miles away. The road for awhile skirted the ocean; then with hair pin curves it swung over the low mountain and we caught our first glimpse of amethyst Haleakala in the distance, rising majestically above the clouds.

In Wailuku, a little town that nestles sleepily among tropical, low mountains, and in the beautiful Iau valley, the Yosemite of Hawaii, we whiled away the next few days.

On a hot August morning about seven o'clock, we boarded the slow-moving, primitive train, "the cannon ball," Elizabeth ironically called it, "on account of its size—not speed," she explained.

Only part of one coach with six seats was provided for passengers, for sugar was king in this country and it was an accommodation to let people ride. Typical of the mixture of races that dwell harmoniously together in these islands were the occupants of these seats. Two Hawaiian women dressed in their native garb, the holoku as they call it, but known to us as the "Mother Hubbard" wrapper; an American traveling salesman, the well-known type; a Japanese coolie on his way to work in the cane fields, Elizabeth and I made up the passenger list.

For a half-hour this primitive train, with its bare wooden seats, chugged and puffed through the middle of sugar plantations, a path cut for it through the tall cane. At Paaia, twenty miles from the top of Haleakala, the other two members of our party who had just made the overnight trip from Honolulu, were waiting for us; a botanist and a lad who had always lived in the islands. In contrast to ours, their trip had been calm and quiet, the night sultry and the landing uneventful.

A surrey was waiting for us, rubber-tired, wide and comfortable. For six miles we drove over flat, hot, dusty country, through more plantations of waving cane. On all sides along the road's edge rose lantana, the lovely island pest, and flaming scarlet hibiscus.

"There are fifty-seven varieties of hibiscus here," said our botanist, "and did you know that this lantana was brought over by the New England missionaries a century ago, brought as a delicate potted plant—and now look at it, a rank weed and the pest of the farmers!"

"It is not the only thing that has come to our islands and flourished," remarked the lad who had always lived there.

"Evidently not," said we, looking at the vast cane fields owned by the children of these missionaries.

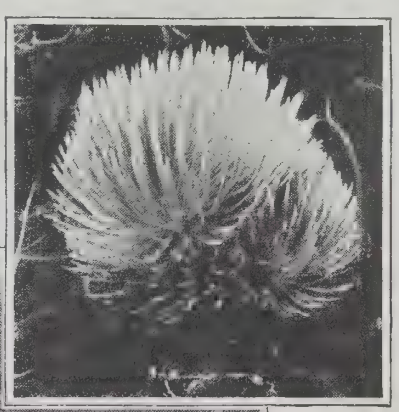
At Puunane we were met by the saddle horses and the guide, horses as rangy as the proverbial mountain goat and as sure-footed, but with comfortable saddles.

"Now, aren't you glad that I warned you not to bring smart riding togs for this trip?" smiled the boy who had always lived there.

He assumed that we were, but "I'm not so sure," said pretty Elizabeth, looking ruefully at me. And never have I seen travelers look worse. In old divided riding skirts, big sombreros and grease paint over face and neck to prevent bad sunburn, we looked and felt like real kamaainas, old-timers. We were to be gone two days and carried only sweater, coat and tooth brush.

Looking ahead we saw rising above the clouds the mountain whose gentle slopes we were to climb, Haleakala, the House of the Sun. Never would one suspect that it was a hollow shell, from whose crater floor inside rise cones eight hundred feet high!

For a few miles we rode up the gradually ascending mountain trail, leaving the tropics behind us, until four thousand feet above the sea we reached "Idlewilde," the charming mountain home where we were to lunch. Sweet peas, forget-me-nots and flowers of the temperate zone surprised us here in profusion—flowers we had not seen since we left the East. And the lunch was not one to be forgotten. Alligator pears and the far-famed Hawaiian pineapple, ripened on its plant, were among other unforgettables.



Above—The Silversword. Below—Crossing the crater floor, the 800-foot cones towering above.

The Needle, Iau Valley.

After luncheon it was boots and saddles at once and the real business of the day commenced. Up, up, up we climbed, eight miles more to the summit. From summer into winter.

At its base the mountain was green and tropical; then for miles there were silver-leafed geranium, scattered kukui trees and little plants no larger than our huckleberry, with pale, red berries.

"Ohelo berries," said the botanist, in reply to our query, "much like our own thimbleberries."

"And sacred to the fire goddess, Pele," added the lad who knew Hawaiian lore. "The nuts from these kukui trees are full of oil that the ancient natives used to burn."

The lantana stopped halfway up the mountain as if afraid to venture further. Vegetation became scarcer until we passed above the timber line. On the edge of this the guide picked up bundles of fire wood; then we passed on and up to where nothing grew. Up through the clouds we rode. Elizabeth began to cough.

"What's the matter," called the lad. "Frog in your throat?"

"She swallowed a cloud," said the botanist. "That's all." And true enough, in scudding mists the clouds were swirling round us, but did not wet us.

"We are in luck today," announced our guide, "for one often gets soaked in these clouds."

Up we climbed over the lava trail, steeper now than ever, for the last mile, the sure-footed horses slipping, skidding and stopping now and then for a minute's rest.

When the summit was reached, first we looked down upon the "Battle of the Clouds," as it is called. Far below we watched the billowy, fleecy, white clouds driven from both sides of the mountain toward each other by the trade winds, now advancing, now retreating, now bringing up whole cavalcades, only to be merged into others of the opposing forces—a celestial battle. When the clouds separated, we could catch a glimpse of the base of this island far below and the surrounding turquoise ocean.

Haleakala, showing the "Battle of the Clouds."

The Fall of the American Newspaper Editorial

Sports, Society, Financial Features All Take Precedence

> Start a personally conducted inquiry of your own to find what parts of the newspapers are read today. If your experience tallies with the writer's, the result will indicate emphatically the decline of the editorial. Whether or not this is due to a dearth of editorial writers such as made that section of our daily newspapers of such vital importance in other days, we do not venture to claim; but that in face of the present trend of newspaper reading some radical change may be expected seems highly probable.
>
> It is going to be mighty interesting for the spectator to watch for future developments among enterprising editors. Our forests are too valuable to waste indefinitely.

By JOSEPH JEFFERSON O'NEILL

WHAT is the least important reading matter that appears in a modern daily newspaper?

There might be a great number of widely varying answers to that query.

My opinion might be that the ultimate in uselessness are the columns reporting the activities of those who make up what is called (by themselves) Society. Yours might be that there is small utility in chronicling the littlest details of how ninety thousand men and women paid a million and a quarter dollars to see four minutes of tussling between a couple of oversized athletes for "the championship of the world." The next one's belief might be that there is a great waste of clean white paper and good black ink in narrating the personal fads and fancies of the so-called stars of the stage and screen. And a dozen others would offer as many different contentions.

But we're all wrong, it seems.

The least important thing in the modern daily newspaper is what used to be called the most important—the editorial: that learned treatise in which we were told by a super-intellect, concealed in a mysterious sanctum, just what is wrong with the world, for whom we should vote, what the Republican party ought to do to be saved, the merits (or demerits) of Prohibition, and the value of the Einstein theory.

This may sound like sacrilege. The shades of the late Messrs. Dana, Greeley and Marse Henry Watterson may storm when they read it—and according to Sir Arthur Conan Doyle the shades do read what is printed in this material world they have left behind. But it isn't intended as sacrilege, and it isn't set forth here as an opinion. It's a fact. We have it from the editors themselves, the New York editors. And who could be more learned in newspaper values than these same pundits who sit in towers and domes high above the metropolis and inform the universe what's what? They themselves decided that their tablet-gravings were of less necessity than anything else in their journals. And here is how that came about:

"What Shall Be Cut?"

SOME months ago there was a strike in the New York newspaper shops. The merits of it have no place here. The pressmen were the ones who quit work. They wanted more money, shorter workdays and various other things. So they walked out on a certain Sunday night, and the presses didn't roll, and on Monday morning the city of six millions was without a single newspaper.

That day there was tremendous activity among the publishers. It was rather a disgrace not to turn out a paper, no matter what the reason. Papers had been turned out in the midst of conflagrations and floods and earthquakes and what not, and there *positively must* be a Tuesday morning issue.

Everything was in order except the pressrooms. Editors and reporters were ready to write, the mechanics were ready to set the type and cast the plates, the motor trucks were ready to haul away the finished product. But there could be no papers unless the presses rolled.

Late in the day a few loyal pressmen were found—just enough to man a single pressroom. This could be run to its capacity. But it was obvious, of course, that there could be none of the eighteen, twenty-four or thirty-two page papers to which New York was accustomed. There were eight morning newspapers to be accommodated, and each must have a fair share of what circulation could be run off from this one pressroom. So the publishers agreed that an eight-page issue should be prepared, bearing at the top of it the accustomed insignia of all the papers, instead of only one.

"Of course, a lot of things must be left out," said the publishers. "We've got to give the public a fair showing of the news, but it can't have everything it has been accustomed to. Now, what shall we drop?"

"Sporting news might be cut down," some one suggested, to be answered thus: "Cut sports? Never! We're going to give the whole eighth page—the best position in the paper, really—to sports." And, with a single exception, all the publishers placed their baseball, racing, fighting, golf, tennis and other athletics on the desirable last page.

"Out with the society stuff!" was another suggestion. But that met almost as strong resistance, at least from two of the newspapers, which depend a whole lot (or think they do) upon the news of the Élite for circulation.

And so with the financial news, Wall Street's activities. Some of the papers decided to devote the better part of two pages to this. And there was "a very important murder trial" on hand, which must likewise get considerable space. Altogether, it was a hard situation. Something had to be sacrificed to make room for these other imperative things.

"Why not the editorial pages?" offered some genius. Ah, there was the right sort of a suggestion! Out with the editorial pages! So out they went, and out they stayed during the course of the strike, and I for one didn't see a single tear shed or hear a solitary voice crying: "What shall I do without my daily advice on what Poincaré should tell Germany?" or "How can I get along without being told what the next movement of the Farm Bloc should be?" Furthermore, from not a soul outside the newspaper trade itself did I hear as much as one comment upon the absence of the editorials. It would appear that editorials in the daily newspapers—in New York at least—have come to be regarded as what the slangily inclined would call "a lot of apple sauce." And if that means that the people are learning to do their own thinking instead of being told what to think, it is not altogether a bad thing.

Editorial Support Fails

THERE came to mind, during the no-editorial period in New York, a skit from the Follies of a season or so ago, dealing with a New York mayor. Now, it may be remembered that John F. Hylan was first elected to that position six years ago, in the face of the almost unanimous opposition of the New York editorial writers. His only editorial supporters were the two Hearst papers, morning and evening. Before election it was predicted that no man could face the opposition of the *World, Times, Herald, Sun* (then in existence) and *Tribune,* and be elected to any office at all. But Hylan was swept in.

Two years ago, with the same opposition, he was re-elected by a majority that broke all records. And so the Follies skit ran thus:

There was a Rip Van Winkle character who was supposed to have slept in New York for twenty years, and awakened in 1941. As he shook his old gray head and whiskers, he said:

"So I've slept twenty years! Who is now our President?"

"Sam Untermyer," was the reply, the name being that of one of New York's Jewish lawyers. This got a laugh from the audience.

"And who is now our mayor?" asked the modern Rip.

"John F. Hylan," he was told.

"Hylan? Why, he was mayor when I went to sleep, and that was twenty years ago," marveled Rip. "How can Hylan be mayor now?"

"Well, Rip, the last time he was nominated the Hearst papers joined all the others in opposing him, so the people elected him for life!"

It seemed to me that the roar of applause which greeted this was indicative of the low esteem in which the people hold the present-day editorial. Some brave newspaper, some day, may come out minus that appendage entirely. And it may succeed. At all events, there will be a great many persons who will not miss anything when they turn the pages of the sheet.

One of the New York papers has run what it calls an "Inquiring Reporter" column. Each day this individual would stop a number of different persons on the streets or in public places and get their views on various matters. One day his question was, "What do you read in the newspapers?" As I recall it, there wasn't one in his queried group who said he read editorials.

"I skim over the first page news and then turn to the sports and see what Babe Ruth did yesterday," was the frank admission of several. Others replied: "Well, I look at the headlines on the front of the paper, and then go back to the business pages." Others—after the invariable glance at the first page—liked news of the theater, or of the movies, or liked to see the "funny column" or the pictures. None confessed to any particular interest about the doings of Congress or of those who govern them, or about what is happening among the nations of the Old World.

New York Reads—But What?

SPORTS, it would seem, attract more readers—at least male readers—than any other subject, so for business purposes the publishers were altogether right in placing their sport-chronicles in a leading position during the days of the eight-page papers.

"Newspaperless New York" seemed a queer place that Monday morning. "Where's the paper? What's the matter with that janitor? What's the matter with that delivery boy?" demanded hundreds of thousands in apartments or houses when the familiar sheet did not appear with the morning's coffee and eggs.

It was a grumpy New York without its papers, too. It really seemed as though something big were missing from life. Why this should be is perhaps hard to explain. It didn't matter, actually, if a man didn't know how the Yankee baseball team had progressed toward the pennant, or if he didn't get a laugh from a cartoon showing a wife banging a husband over the head with a rolling pin. But there undoubtedly was a hiatus, even though it were just a break in a fixed habit.

The word spread quickly enough that a strike was responsible for the non-appearance of the newspapers, and then the question arose: "What am I going to read on the way downtown?" For New York is a city that reads—no matter what its choice of literature may be. As one of the so-called comic strips inquires daily: "Can you beat it?"

Loans and the Gold Standard

THE advancement of one hundred million dollars to France by the international bankers in New York reminds one of the stock market gambler putting up margin in a vain hope that he can postpone the final call that will wipe him out.

It would seem as if this heroic move to halt the rapid decline of the franc and the price of French government bonds in America was made because the insiders were unloading upon the ignorant public faster than it would absorb.

The publication of the appraisals of the estates of wealthy New Yorkers, men who sit in on the international schemes that are capitalized there, shows that none of them hold a single one of these foreign government bonds they have "distributed" in this country to the extent of billions. They put their own money in Liberty and gilt-edged municipal bonds and some industrial issues.

This is not a reflection upon the integrity of the unfortunate foreign people whose credit and good names have been hypothecated by the international money lenders to such an extent that liquidation is utterly out of the question. They have been victimized in the same way.

The international money lenders are making their last stand in New York. The European sucker list has been squeezed dry where the people's assets have not been dissipated by misgovernment. Our credit merchants seemed to feel immediately after the close of the war that they could lend American money abroad in such a volume that their commissions would be enormous. They made a brave start and sank almost a billion of our people's money abroad before the foreign countries by their inability to pay interest upon their war borrowings from our government showed the state they were in.

England will be used to refute this statement, since she has funded her debt here. However, a leading reason for Baldwin being overthrown as prime minister was that he agreed to pay the debt to America when he was sent to America to beg off.

The London *Times* in commenting upon the appointment of a parliament committee to consider the question of the national debt referred to its being ten times as large as it was before the war; its service requires over one-half the tax revenues of the country and four billion dollars of it is a floating debt.

That England has abandoned the gold standard is indicated by the *Times* admitting that until the floating debt has been funded the restoration of the gold standard cannot be tackled.

A Weak Spot in the Movies

IT IS a foregone conclusion among fair-minded, not to say reverent-minded observers, that the movie-makers are consistently overshooting their mark in caricaturing the profession of the Christian minister. Granted that there may be occasional quacks in church circles just as there are occasional quacks in medical and educational and other circles, why tar all the representatives of the profession with the same stick? Why permit a few insincere particular instances to assume the proportions of a damaging generalization?

There is less than nothing to be gained by such a method. While it may secure the rise of a general laugh, innocent and wholesome as that may be, at one and the same time it registers disrespect for what is not only an eminently respectable but also a sacred function. And it is quite characteristically true that what we poke fun at we do not respect overmuch. Conversely, what we cherish a deep-seated regard for we do not make a matter for ridicule.

There is still more to it. The times are more sadly out of joint than Shakespeare ever dreamed. It is bad enough that any number of adults could get the consent of their own minds to buffoon and belittle such an institution. It is incalculably worse that children, many of whom have seldom seen the inside of a place of worship, should be given a burlesque upon which to base their first impressions. Such a condition of affairs is not only sacrilegious, it is an unforgivable offense against childhood here and now and a spiritual disability to be entailed upon the generations yet unborn.

The remedy is a thoroughgoing public disapproval. Once thinking people awake to the real import of such films and apply the necessary moral corrective, this libelous practice will cease. The public can have exactly what it demands.

Modesty May Be Its Own Reward

THE recent death of Dr. P. H. Dudley, a son of the Middle West, and the record of his useful life of eighty-one years, serve to impress us with the value of the research engineer to the world.

Dr. Dudley spent more than fifty years on the problem of designing steel rails strong enough safely to carry heavy freight and fast passenger trains. His hard work and genius enabled the rail, the primary and vulnerable part of the transportation machine, to keep pace with its increasing burdens.

Dr. Dudley's numerous inventions of rails, as well as the marvelous machine that registers the strains on rails under moving trains, made him a world figure in his field, although the general public, the real beneficiary, hardly knew this man existed.

He was always striving to make the railroads safer, delving into the making of locomotive tires and structural steels. He was the first to announce, forty years ago, that fungi are the cause of decay in wood.

It is such men as Dr. Dudley who enable each succeeding generation to live better and longer. They are the salt of the earth, the modern indication of our progress from the cave man.

Is the Federal Reserve Doomed?

ASIDE from any dispute as to the power or effect of the Federal Reserve System for good or evil, anxiety exists among both friends and enemies of the big machine as the time approaches for reorganization or liquidation. That it is none too early to give the matter consideration is clearly evident. Even the caution of the bankers is not sufficient to keep hidden the knowledge of a coming storm. A very prominent National Bank recently complained of the Federal Reserve law forbidding the payment of interest to member banks on daily balances.

A letter from a New York economist declares the doom of the Federal Reserve is sealed unless outside business can be attracted. Member banks today are not rediscounting their commercial paper in volume sufficient to keep the Federal Reserve Banks in profitable business.

On the other hand, some member banks are grumbling because compelled to maintain a reserve, including their personal gold holdings, in the Federal Reserve and are allowed no interest. Already enjoying a much greater interest on their original investment through the cumulative six per cent allowed them on capital stock and surplus, these "Oliver Twists" may well be satisfied if the system is liquidated before it breaks down.

That the grave trouble with the system is in large part due to its bad, not to say vicious, operation in recent years cannot be doubted. Dr. Anderson, economist for the Chase National Bank of New York, has pointed out the intended objective of the system and some of its adventures which have been unwise and imprudent and outside any legitimate purpose.

One cause of present trouble is excessive overhead. It was easy to take the franchise tax to build up palatial banking houses, for of the millions spent in the Federal Reserve and branch cities, $90 of every $100 came out of Uncle Sam's share of what otherwise would have been net revenue; but it is not so easy now to meet the expense of maintenance, which has increased as a consequence of this expansion.

These statements are facts. There are many deeply concerned in the outcome, though powerless to apply a remedy, who must nevertheless assist in defending the system from outside attacks and quieting the mutinies within. The enormous profits of the years of depression created an appetite that the normal gains of a system economically managed cannot satisfy. When speculative usury is rampant, there must be a constant withdrawal of support if the Federal Reserve remains purely a "bank for bankers," while, if permitted to seek outside business further than it already is doing, the machine itself must become a competitor for business its members are attracting.

Why Play the Rich Uncle?

THE circumnavigation of the globe by the army air service will give the United States worldwide prestige and glory for all time.

Such a prediction cannot be made about our navy's air service participating in the projected polar flight of a Norwegian government expedition headed by Roald Amundsen.

It seems that our navy will furnish the services of Lieutenant Ralph E. Davison and his airplane, and the American public is expected to put up two hundred thousand dollars for the Norwegians by purchasing as many Norwegian government special polar postage stamps through Gimbel Brothers, a department store on Broadway.

In a full-page announcement in a New York Sunday newspaper Gimbel's state they will sell the stamps without profit. At the bottom of the advertisement this notice appears in blackfaced type: "All Business Pertaining to Expedition in U. S. to Be Transacted Through Gimbel Brothers Inc."

It was intended that the Shenandoah make a flight to the pole to annex any land discovered. The Norwegian government recently had the statement made in New York that all lands discovered by this party would be claimed by Amundsen in the name of the King of Norway, regardless of our contribution which has saved the scheme from being given up.

Norway is to be congratulated upon its prospects. However, we fancy that if Harrod's in London were to serve as any agency to raise these funds for a foreign annexation scheme they would be called to the Foreign Office and reminded of their obligation to their own country.

Concerning National Security

WE HAVE come to think of France as the greatest sufferer from the war, because it was on her soil that a large part of the conflict was staged, and the wounds are still there, visible to the eye.

But there are other nations who are binding the wounds of war, and find even greater difficulty than France. England is an outstanding example of this group. Elsewhere in this issue Mr. Crowther gives a graphic picture of England's post-war conditions. This article merits a careful reading by every thinking person. The problem of destroyed markets and resulting unemployment, for example, has assumed gigantic proportions.

It is refreshing to note that Mr. Ramsay Macdonald, in his recent letter to Poincare, takes full cognizance of the entire situation on both sides of the English Channel. He reveals a full and sympathetic understanding of the French conditions. What he says is not new. On the contrary, it has been said again and again. What is new is that it is said by the responsible head of one government to the responsible head of another.

Mr. Macdonald admits that France has just cause for grievance in the failure of Great Britain and the United States to guarantee France's safety on the Rhine, and admits that this failure is responsible for much of the apparent French aggression.

But Mr. Macdonald goes further. In summary, he says:

"The French people desire security; the British people cherish an identical idea, but whereas France conceived of security as security against Germany alone, the British Empire attributes to the word a far wider significance. What we desire is security against war."

From Washington comes the apparently official announcement that Senator LaFollette offers himself as the Moses to lead the Progressive wing of his party out of the wilderness of slavery to the "invisible government," and with the help of those in other party affiliation, drive from power those who are alleged to control both of the major parties in the recent past.

Senator Moses of New Hampshire has been defeated for delegate-at-large to the Republican National Convention because he asked to be sent without instructions. He had previously expressed his personal preference for the nomination of Coolidge, but his opponent was willing to be instructed to support the President, and the delegation was made up of that class, and he was "steam-rollered." Moses is a leader of the regulars in the Senate.

The United States Supreme Court denies to the Federal Trade Commission the right to search the records of the Lorillard Tobacco Company for evidence in the case of unlawful acts in restraint of trade against the "tobacco trust." But that will not prevent search of the books of individuals or corporations suspected of evading income taxes.

Switzerland and the Co-operative System

Agricultural and Consumers' Societies Oppose Local Trusts

By HUSTON THOMPSON

CROSSING the invisible line that divides distracted Germany from serene Switzerland brought a profound feeling of relief. Leaving Stuttgart on the train bound for Basel, Switzerland, the throng of people in the station was so dense that it was difficult to make one's way, and, although traveling first class, it was impossible to get a seat and eight hours were spent on the rear platform of our coach.

A new lease on life seized us as we passed through the gates of the picturesque and magnificent depot at Basel.

Switzerland is in some respects better adapted to the application of the co-operative system than any other country. In the first place, it is very small. The population though quite dense is well spread out, making for a more or less ideal situation. Geographically the cantons so divide the country that it is not difficult to have small regional organizations which can head up in one national organization. Moreover, the country has lived under democratic rule and exercised self-control for so long that its people understand the necessity for team play in matters affecting their welfare.

Despite this almost ideal situation for Consumers' Co-operatives, the Swiss are foresighted enough to see that one of the problems that must be dealt with is the question of size in their organization. In fact, Mr. Grandjean, the director of the very efficient local Consumers' Wholesale Society at Geneva, told me that one of their pressing problems was the decentralization of administration from the national co-operative organization to the local, and that the local societies were insisting on more autonomous action and power for themselves. Mr. Grandjean, when I referred to the enormous size of the British co-operatives, said that he believed they too would have to meet this problem.

He suggested that, if America were moving along the lines of consumers' societies, it be very careful not to force into the foreground a national organization with too much centralized power, but let it come through a spontaneous demand on the part of the local societies.

Switzerland fairly teems with new co-operative ideas and suggestions. One that caught my fancy immediately was the use to which they put electricity. The electric co-operative society in Basel distributes current to each member in his home. Many houses in that region have a ribbon power-loom. Members of the family who are not occupied with other duties use the electricity to drive the power-looms and have become weavers for the great Basel firms. This organization now has a membership of 8,927.

To those who are studying size and its point of inefficiency in industry and the dangers of congested areas in our cities, the establishment of the loom and the wire in the home where manufacturing on a small scale can be handled should excite some interest.

Co-operative Money Used

ONE thing particularly unique about the consumers' society's method of doing business was the use of co-operative money. This money is in the form of copper coins of five and one franc and fifty, twenty and five centimes denominations. A member of a society desiring this money presents Swiss legal tender to his society and in return is given the copper tokens which are equivalent in buying value to the money he has tendered. This is then turned over to the housewife who is generally the buyer.

The advantage to the consumers' co-operative organization is that it gets the legal tender of Switzerland for its needs in advance of the use of the copper money by the members and makes certain the sale of as much of the store's goods as the copper money will buy.

There is a little joker in the situation for the housewife. Since the money has no value outside the co-operative stores, she can't spend it for any pleasures, luxuries or other things that might strike her fancy in other stores.

The Basel co-operatives believe that the use of this money has passed the experimental stage. I have not been able to visualize the effect of its use in all co-operative stores in Switzerland, but if it is a success in Basel I see no reason why it should not be extended through all the consumers' co-operative organizations.

Our visit to their shoe factory in Basel brought a universal reply to the question of why they had gone into manufacturing. They were "fighting back at the shoe manufacturers who at the instance of the wholesalers and retailers had boycotted them" by refusing to sell to the co-operative societies.

In their showroom, they had on exhibit 150 different styles. I expressed surprise at the additional cost that must be added to each pair of shoes in making so many different kinds and asked how the members tolerated such additional expense.

"They tolerate it all right," said my auditor. "In fact, this exhibit is a lesson in the demand for free play in individual taste that not even the cost or price can prevent. We can standardize taste only to a certain degree and must be very careful that we do not cramp the individual's desires. We find that the 150 different styles do not always cover the different tastes of our members, and at times we go into the market and purchase other styles rather than lose a member."

On passing through the plant, I was taken to each machine that is used in making any part of the shoe. The nameplates on all these machines indicated that they were bought from Germany. That immediately started a trend of questions as to whether co-operatives owned the machinery outright. They informed me that they did.

"Well!" I said, "I recall an instance in the United States where the parties were required to purchase their machines on the condition that when they were through with them, they would return them to the seller, and also would permit a monthly inspection and pay the one from whom they were purchased according to the extent that an indicator on the machine showed it had been used."

I was assured very emphatically that the co-operators would not buy on such terms and if they could not get the machinery otherwise they would do without it. They felt confident that no such contingency would arise since they were so strong that they could purchase on an equality with any manufacturer.

An inspection of the shoes made by these co-operatives indicated that they were of the very best material obtainable and were manufactured to wear just as long as possible.

"You see," said my guide, "that we reverse somewhat the purpose of manufacturing. The private manufacturer frequently makes shoes with quantity production and profit in mind. It would not be to his interest to make his shoes along indestructible lines. We, however, are compelled by our members to make our shoes as nearly indestructible as possible without any thought of profit. "Saving with profit is our co-operator's shibboleth."

Excellent Working Conditions

AS IN most of the European countries, they have adopted the eight-hour law, so the employes in the Swiss manufacturing plants work forty-eight hours a week. The light and other sanitary conditions are excellent. If one of the employes is injured, he receives eighty per cent of his wage from the government and twenty per cent from the factory, and the co-operatives pay the state's premium. They also have a pension system and retire their employes at the age of sixty.

To date, they have had no strikes, though undoubtedly the co-operatives in Switzerland as their plants grow will have to create a mutual interest that will tie the employe close to them.

The investigation of a very modern first-class dairy in Basel operated by the Consumers' Co-operative threw a new light on the relation of the farmers' agricultural societies to the consumers' society of the city. Some time ago the farmers' societies, of which there are three thousand, handling milk and milk products, had the milk production practically in their control. They found that they could not come to an agreement with the Consumers' Co-operative dairy interests on prices. As to who was in the right I am not informed, but at this juncture the farmers refused to sell milk to the consumers' society and the latter retaliated by buying from the great milk products manufacturers of Switzerland.

This brought the situation to a climax. Government representatives were called in and, together with the farmers' and consumers' representatives, a price was arrived at which was agreeable. Since that time this method has been pursued to the apparent satisfaction of both groups.

Since 1916, the consumers' societies have indulged in a very interesting experiment in farming. They have bought farms in many different parts of Switzerland and placed practical farmers on them. They admit that the returns to date do not appear very favorable, but they offset this by saying that the circumstances under which they have entered this field have been very unfavorable owing to economic conditions. Through this experience they believe that they will gain a desirable objective and an unprejudiced view toward Swiss agriculture, and in this way be better able to deal with the farmers in the matter of prices. It is too soon to determine how much good has resulted from this experiment. Whether a success or failure from a pecuniary point of view, it should help to bring the toiler of the city and the farm into a more reasonable and more sympathetic relationship.

The co-operative movement has a marked dominance in the field that its manufacturing plants occupy. At Zurich it owns and operates the largest flour mill in Switzerland. This mill has an interesting history and is typical of how a co-operative organization can halt a monopoly in its tracks. In 1912, the association of bakers of East Switzerland notified the millers that they must not sell flour to the co-operatives, their complaint being that the co-operatives sold bread cheaper. The millers are said to have acquiesced with apparent eagerness.

With secrecy and dispatch the co-operatives acted. In a short time they sprang a tremendous surprise by announcing that they had acquired the most important milling plant in Switzerland at Zurich. In a short time the flour millers' trust broke up. Despite the economic disturbances of the war and the constant attempt on the part of private interests to wean local societies away from the support of their milling industry, the co-operatives continue to manufacture their own flour and are the largest producers of this article in Switzerland.

On the outskirts of Geneva, I visited a wine depot, owned by the co-operatives, which is the largest in Switzerland, having a capacity of five million liters and containing at that time 2,500,000 liters of wine. The superintendent of this plant, when we had walked underground between the gigantic casks, began cross-examining me, with some amusement on his part, on prohibition in the United States. After obtaining my views he informed me that he had been to Bordeaux, France, and had seen 2,800 boxes of wine containing twelve bottles each on board ship destined for America, as evidenced by the ship's papers which he had read. Inquiring how it was that they were shipping wine to prohibition America, he was told that there were drug stores in the United States that needed it.

Switzerland is one of the few places where the co-operative banks accept deposits from outsiders. The Raiffeisen plan of credit societies is in vogue throughout the farming districts. The members of these credit societies are subject to an unlimited liability.

In the matter of politics, the agricultural societies have great strength and influence with members of the legislative bodies. The consumers' societies which number about a thousand have no political party and do not attempt to act as a political unit. However, on occasions they have taken up the cudgels for economic policies and when they have done so, they have been very effective.

In 1890, they addressed Parliament demanding a tariff policy more favorable to the consumers, insisting that the scheduled rates should be reduced. Having obtained reductions, the national consumers' organizations stayed out of the campaign but permitted the members of local societies to vote as they liked. The result of the ballot was that the low tariff as approved by the Consumers' Co-operatives became a law.

In 1902, the question was up as to whether Switzerland should have a tariff for revenue only or a protective tariff. Again the consumers' societies of the cities won out having taken a stand for the tariff for revenue. This estranged a number of agricultural co-operatives as they were very earnest partisans for the protective policy.

The members of the consumers' societies, through meetings and through their magazine, which has a weekly circulation of more than three hundred thousand, keep themselves well informed as to what is going on. Some of their representatives informed me that there is a crisis impending in the co-operative world just as there is in private business. The latter has prepared to meet it by reducing the number of employes. The co-operatives realize that the time is at hand when they too will have to make reductions. They think there is no question about riding the crisis successfully because of the universal intelligence of the people of Switzerland, the great majority of whom, with all classes represented, belong to this movement, and are included in its 12,000 local agricultural and consumers' societies.

International Co-operation

AS I see Europe, the next great war will not be between nations––if a war of arms is postponed five years—but it will be a bloodless economic war between international trusts on the one hand and an international co-operative organization on the other.

The co-operator dimly senses this war. He knows full well that he is not prepared for it because he has all he can do for the present to recover from the body blows he received during the World War. As the pressure of the trusts is being felt, the co-operator is gradually awaking to the urge for preparation.

In the meantime, the Consumers' Co-operators are centering their attention on their domestic trust, making them sit up and take notice or destroying them. In twelve countries of Europe there are today 25,000,000 members of consumers' co-operative societies, which means that most of the necessaries of 125,000,000 peoples in these countries are being supplied through their local societies. But far more important than this is the fact that in all Europe thousands upon thousands of meetings are being held by local societies every month at which, through propaganda and teaching, the spirit and purpose of co-operation is being drilled into the members or incited in prospective members. If one were to drop into any of these thousands of meetings and inquire why they exist, the universal answer would be because of the greediness of the trusts or the usurer.

In other articles I have referred to the fact that the Great British consumers' co-operative society purchases, blends and puts up tea for co-operative organizations throughout Europe. Norway, Sweden, and Denmark have an association through which they buy articles necessary for their members. When the present rates of exchange are more settled it will not be at all surprising to see the societies of Esthonia, Latvia, Lithuania and possibly Finland joined together in another buying group. In Germany it was suggested to me that some day they hoped to have a purchasing organization in connection with Austria and Italy. It is not beyond the range of imagination for Spain, France and Belgium to come together. Already England, Ireland and Scotland have interlocking co-operative purchasing organizations.

During the war the British organizations helped out the co-operatives of allied countries by assisting them in obtaining goods. Today Russian co-operatives, through an organization known as the Centrosoyus, have offices in London which are doing business with the British co-operatives while the British consumers' societies are purchasing from the farmers' co-operatives in Denmark and other countries. The moment that domestic situations are more settled we can expect to see great international buying organizations based on racial lines and contiguous territory acting in concert. When this happens, it will not be difficult for the several interna-

COLONEL FRANK WHITE,

Treasurer of the United States, who receives hundreds of conscience fund contributions.

Money Received From Persons Unknown

Hush Money Comes Regularly to Uncle Sam to Ease the Pricks of Somebody's Conscience

By GEORGE H. DACY

HONOR bright, now, cross your heart and promise that you will not divulge this big secret about which I am going to tell you.

Close all the doors and windows, be sure that no one is listening, and we'll all group closely together and talk in whispers, for that highly efficient and effective branch of the United States Government, the Secret Service even, might be interested in what we shall say.

Yes, Uncle Sam receives hush money regularly—two and three times a week. The hush money, however, is not sent to the United States Treasury at Washington as bribery payments but to hush and silence the painful pricks of somebody's uneasy conscience. Somewhere, sometime, some one defrauded our venerable national relative in one way or another. His conscientious restlessness and dispeace finally become so distasteful to the offender that ultimately, in an anonymous communication, he remits to Uncle Sam the funds which are rightfully government property.

That is the brief explanation of the "how come" of the conscience fund, the most curious contributions which ever flow into the voluminous Federal moneybags. There is no psychology more novel or extraordinary than the workings of the human mind which finally force the culprit to make good the losses which the national government has suffered as a result of his malicious or unintentional acts.

Webster calls conscience "knowledge of one's own acts or feelings as right or wrong." The sense of duty, strong in the most of us, to be honest and truthful and to abide by every requirement of modern law is centralized in the dictates of our conscience. Conscience drives murderers to confess their crimes. It impels robbers after years of apparent safety to admit their unlawful actions. Conscience is responsible for baring to sleuthlike sentiment the carefully concealed skeleton in many a family closet. And conscience, in time, obliges smugglers, customs-evaders, contractors who overcharge, income tax reporters who forget to declare all their wealth and those who are overpaid in any manner by Uncle Samuel, to make restitution to the Federal Treasury Department for all funds which they undeservedly have received.

More than a century ago—to be exact in 1811—the first conscience fund contribution came anonymously through the mails to the Treasurer of the United States. It was a five-dollar bank note. Penciled, evidently in disguised handwriting, on a scrap of accompanying paper were the words, "To be credited to the account of money received from persons unknown." In some manner or other, the sender of this $5 bill had evidently bested the government. When the act occurred, nobody knows. The return of the money was simply a business transaction between the guilty party and his God.

From that day to this, contributions to the national conscience fund have been received regularly at Washington. Sometimes three or four of them will be credited each week to the unique account. Really there is no conscience fund essentially as such on the national ledgers and cash books. The conscience or hush money goes to the miscellaneous or general funds of the Treasury Department. Conscience contributions are neither governed nor regulated by Federal law. Here is one case, at least, where our circumspect national lawmakers have seen fit to leave well enough alone.

The sense of duty and honor debts which unknowns have paid to Uncle Sam now aggregate more than $560.000. The smallest sum ever received has been two cents. Many persons in all parts of the United States have used a two-cent postage stamp a second time. Thereafter, discovering that their actions were illegal, they have mailed two-cent contributions to the Federal conscience fund to atone for their acts. The largest sum delivered in Washington via a bank draft from New York amounted to $18,000. The identity of the donor was never ascertained. Uncle Sam feels in honor bound not to try to seek out the anonymous contributors who endeavor in this remarkable manner to "square" themselves with the government and their Maker.

During the Civil War, a certain soldier of unknown identity stole one of Uncle Sam's Missouri canaries—a mule of particular parts and attributes. The mule in time came to be the foundation of this deserter's prosperity. Every time he earned an additional dollar, he could indirectly trace its origin back to the mule. His conscience hurt him more and more. Finally, he scrawled an unsigned confession on a shred of paper, sealed it in an envelope with enough currency to pay for the original value of the work animal with the accumulated compound interest and dispatched it to Washington.

A certain New York importer more than a half-century ago brought suit against Uncle Sam, claiming that several of his most valuable commodities brought in from abroad were seriously damaged while in the hands of the United States Customs. This man, furthermore, proved that he had been charged excessive customs rates on certain articles. The case was decided in his favor and the United States Treasury sent him a large check to adjust the legal altercation.

Several months later, one-half of a $1,000 government bond was received by the Treasury official who at that time attended to conscience fund contributions. It was from the importer. He stated that upon sober reflection and study, he had decided that the government overpaid him to the extent of $1,500. He sent the mutilated bond for which he had paid cash as his first contribution to square his obligation. He promised to send one-half of another $500 Treasury bond. Shortly afterward, the Civil War broke out and the supposition is that this importer enlisted in the Union Army and was killed, as nothing more was ever heard of him at Washington.

The greatest quota of conscience fund contributions flooded the Washington mails during the aftermath period of the notable "salary grab" era of the Forty-third National Congress. The Federal legislators enacted a law at that time increasing the salary of each Representative from $5,000 to $7,500 a year. They armored the clever piece of legislation by making it retroactive so that they personally would benefit. As soon as their constituencies in all parts of the country became intimately familiar with all the workings of the "salary grab" act, they set up such a howl of protest that the majority of the national lawmakers were so afraid of losing their statesmanship seats at Washington at the pursuant elections that they turned their salary increase money into the Treasury Department conscience fund.

The "money received from persons unknown" account thus was augmented by many thousands of dollars. It is notable that the minority Congressmen, who persistently accepted the increased monthly checks in payment of their legislative services and did not revert at least a part of the money to the conscience fund, were missing when the initial roll call of the next session of the newly elected lawmakers was called. Popular sentiment defeated these candidates at the polls. The "salary grab" act, which was to increase their fortunes, really developed into a vehicle of great misfortune. The archives at Washington show that some of the Representatives neither cashed their pay checks nor turned them over to the Treasury Department. Many years later, after these statesmen had died, the administrators of their estates presented the belated checks to Uncle Sam, who paid them.

(C) National Photo

A case of dishonesty or defalcation of government funds has never occurred at the United States Treasury.

The supposition among United States Treasury officials is that much of the hush money which the conscientious return to the impregnable vaults of the City of Presidents consists of overpayments which your Uncle Samuel made in one way or another to these different donors. Sometimes, the customs officials at the American ports of entry may be a little careless and admit goods at prices lower than those that should obtain. On other occasions, American tourists surreptitiously smuggle certain commodities such as jewelry into the United States from abroad without declaring these dutiable articles. Sooner or later, some of these persons suffer from an acute attack of remorseful conscience and secretly remit the balance which they owe to the Washington Treasury.

Several years ago, one of the paying tellers at the United States Treasury found that he was twenty dollars short on the day's transactions when he came to check up his funds at night. He made up the deficit out of his own pocket. About a year later, a stranger stopped at his window and asked if he had been on duty there the previous year and if he had noted any money shortage on a certain specified date. The teller referred to his books and found that the day stipulated was the one when he lost the $20. He told his inquisitor of the occurrence.

"You overpaid me $20 that day," replied the layman. "I was about down and out. That extra money aided me greatly in getting back on my feet again. I took the money and used it. Now I am returning it with compound interest. It was the first dishonest act of my life. If you say so, I will confess my offense to the proper authorities and pay the piper. My conscience would not allow me to neglect this obligation any longer." The Treasury employe accepted the proferred bank notes, wished the penitent man good luck and has henceforward been one of the most loyal supporters of the national conscience fund.

Latterly, the majority of the anonymous contributions to the government financial assets have consisted of relatively small amounts, ranging from a few dollars to as much as $100. Five $100 bills were received recently, accompanied by an unsigned letter requesting that the money be credited to the conscience fund. Treasury officials believe that they know the source of this gift. It appears that during the last half year, a certain government official, through no fault of his own, mislaid $500 of Uncle Sam's currency. It is quite likely that the money sent in to Washington comes from the person who found the lost funds.

Psychologists throughout the United States will doubtless be interested to learn whether the effects of the World War have reacted to soften the consciences of Americans so that they are contributing more largely than ever before to the Federal conscience fund. A certain prominent eastern minister recently interrogated Uncle Sam about this matter. The government experts made a critical statistical survey of the conscience fund contributions to assemble accurate data for this clergyman. The facts and figures are to the effect that there has been no increase in the amount or character of the anonymous money gifts since the cessation of hostilities. As gauged by the reflections from the extraordinary Treasury balance, the conscientiousness of the average American was no greater in 1923 than it was in 1913 or 1813.

The honesty and reliability of the government employes who daily handle enormous sums of money in the service of Uncle Sam are admirably endorsed by the spotless record which they have established and preserved. There has never been a case of robbery or defalcation in the Treasury Department at Washington. During the administration of John Burke as Treasurer of the United States, although more than $56,000,000,000 were handled, the only shortage that occurred consisted of $30,000 worth of government bonds that were lost by several faithful messengers. These bonds evidently were destroyed by fire or other agency, for their coupons have never been sent in for collection.

Colonel Frank White, Treasurer of the United States, venerates the national conscience fund as a desirable and permanent monument to the conscientiousness and integrity of the American people. He believes that Uncle Sam will always respect its inviolable secrets. It is our strangest unwritten court of retributive justice. Its unusual tales will never be written. Like the rock of ages, it will endure sempiternally.

Georgia's Many Complex Dilemmas; How a State's Exchequer Was Sealed

Old Southern State Noted for Long Line of Strong Leaders; Marks Time Awaiting Advent of a New Political Moses

By AARON HARDY ULM

"I HAVE locked the treasury and thrown the key away," declared "Bob" Toombs after he had written the bulk of it and seen to the adoption of the present constitution of the state of Georgia. And a half-century of time has proved that there was as much truth as epigram in the remark.

The result is that fundamentally the state government of Georgia is financially one of the soundest in the country. For a quarter of a century there has been virtually no increase in the tax rate. The state's funded debt steadily has been reduced. It now amounts to only a few million dollars, and is offset by income-earning property, itself unencumbered, worth from two to three times as much as all the state owes. This property comprises a railroad which was built by the state more than seventy-five years ago and has never passed out of state ownership. It is one of the best roads and for its length the most valuable, probably, in the South. It has been a paying investment almost continuously since the road was constructed, though for the last forty or fifty years it has been operated, as at present, under lease.

The retention and successful handling of this railroad, together with steady reduction of the state's bonded debt and the keeping of the tax rate within firm and modest bounds, is owing almost wholly to a stern public opinion on the subject of state finances. Regularly the politicians would have changed it all had they dared to do so. Though they frequently have rushed upon it with all their might they have found the state treasury not only locked with no key available but walled about with barriers invincible.

The Fixed Tax Rate

HOWEVER, there has been no barrier against the spending of money which did not exist. And this the politicians, as conductors of the government, have been doing more or less regularly since Toombs put an unbreakable seal on the state's exchequer. The people, well protected by that seal, have let the politicians wrestle with the problem thus created. For they, the people, should worry! No matter how much the government of its own accord may spend, the tax rate cannot be increased except by direct vote of the people. And though running deficits grow and are tossed back and forth by administrations and factions, the people generally look on and smile—and ask for more. For no matter how far the politicians go they cannot materially damage the state's credit. And no matter how badly they would like to do so, they dare not risk their official lives by advocating the removal of the barrier to raising the tax rate. Only occasionally has one been so bold as to urge the issuance of new bonds to get funds with which to meet current deficits, and these have taken care to camouflage the move as one connoting more of other things like roads and schools than of debt.

The situation is an anomalous one, but Georgia's history is filled with anomalies and paradoxes. For example, as a colony Georgia was "dry" long before the word "prohibition" was current. Though the state gave freely of its wealth and its blood to the Confederacy, its history contains one of the oldest of anti-slavery traditions. As long as James Oglethorpe, Georgia's founder, lived, neither slaves nor booze were permitted there.

Now basically one of the financially soundest of state's government, it yet is one of the chief duties of Georgia's governor to haunt the precincts of the money lenders, hunting for money with which to pay the school teachers and the pensions provided for Confederate veterans.

Georgia's Constitution

THE constitution places a limitation on the shaving of short-term notes, and this emergency device long ago ceased to cover the steadily widening gap between income and outgo. Then a governor hit upon the device of auctioning off postdated executive warrants. This did not long suffice. Then they pawned the rental notes covering the lease of the state's railroad.

Now about everything that can be kited or pawned is afloat or in soak—excepting all but a modicum of the state's long-term credit. The situation has reached a stage so crucial that the governor has called an extraordinary session of the legislature to deal with it.

It is inherently a political, far more than a genuine fiscal, condition, for it owes chiefly to faulty taxing and appropriating methods, made worse by political juggling.

And yet the politicians deserve no great amount of criticism for the curious condition besetting the state's running fiscal affairs. There has been no appreciable amount of grafting. Waste there has been, as nearly always exists in government everywhere, but the difference between income and outgo is due in no great measure to that evil. It is owing in greatest part to rivalry between the politicians and the factions, through which the state's politics functions, in the realm of more or less commendable generosity—toward the public schools and the state's eleemosynary institutions and lately, to some extent, public roads, and the veterans of the Civil War.

Of the approximately $10,000,000 of revenues raised by the state government in 1921. about $5,750,000 went to the public schools or to state-operated institutions of higher learning. This item of expenditure has doubled several times during the last twenty-five years. All of the money for education has not been expended as well as it might have been, but of graft in that sphere there has been none and such waste as occurs is due more to local than to state agencies. Nearly two millions and a half went to the support of eleemosynary institutions or for Civil War pensions. Less than a million dollars was left for the general expenses of the state government and for interest and retirement of public debt. Hence there wasn't much room for outright graft or atrocious waste, excepting, for the latter, that of benevolent kind, such as perhaps a too non-discriminatory system of war pensions.

The Georgia constitution, one of the best ever written, is based largely on the assumption that it is humanly natural to abuse political power. Hence, its chief characteristics are the safeguards and restraints thrown around and put upon public offices. Most of these grew out of sad and costly experiences, such as that known as the Yazoo fraud in the early days of the state and the carpetbagger régime following the Civil War.

Two items are well worthy of adoption by the Federal Government. One is the stipulation that the caption of every bill enacted by the legislature must contain a summary of the bill's contents. Another is the power given to the governor to veto any item in an appropriation bill.

Probably nowhere else in this or any other country is the public official made more affirmatively the servant of the public. Georgians have ever delegated political power reluctantly and have watched its use suspiciously. This attitude has yielded defects as well as safeties. For example, when the people, or even mobs, so will, they are all but supreme in the state. Even the courts are partially silenced, as by the state's "dumb" act, which forbids a judge even to intimate an opinion as to evidence in a case.

Then over all hangs the blight and blessing of the one or rather no party system of government and politics.

Brownites, Hokites and "Pops"

INSOFAR as state government goes—and in all but a few isolated spots local government, too—in Georgia, the Democratic party is everything in a titular way and nothing in an actual way. Hence the Democratic party, as with the all but nonexistent Republican party here, stands for nothing, and really counts for nothing. Succinctly, Georgia has no political parties; it has factions only. These factions often are more intense and develop a bitterness in rivalry not found in real parties elsewhere. They revolve in the main around personalities. They are more potent for opposition than construction. This kind of factional politics makes handshaking count for more than discussion.

For many years the outstanding state factions were known as the Brownites and Hokites. The latter were the supporters and the farmer the opponents of Governor and later United States Senator Hoke Smith. In between and holding the balance of power stood the "Pops," made up of surviving remnants of the old Populist party. These latter followed with a loyalty approaching worship all the eccentric windings and turnings of the late "Tom" Watson.

During his latter years Watson was the arbiter—indeed, almost the boss—of Georgia politics, ruling through the Democratic party which he hated and to which, until a few years before his death, he abjured all allegiance.

Litterateur, author of two or three of the best written histories of modern times, man of wealth, Watson came near to being the perfect agitator. He threw his decisive influence first to one faction, then to another, as the impulse of the moment moved him to do. At times his moves were so irrational as to cause his sanity to be suspected. Yet for nearly twenty years no man could be elected governor without his support, and ultimately Watson himself was sent to the United States Senate.

Political demoralization was the result of this situation and conditions which abetted it.

Constructive and courageous men, already being weaned from public life by the more inviting fields of business and the professions opened up by the development of the New South, stepped aside almost unanimously in favor of the time-serving type of politician.

Even the capable politicians steadily were destroyed in the fires of factionalism which they kindled and fanned for their own glory. Hoke Smith, defeated for re-election to the United States Senate, settled in Washington and returned to money-making. Even Thomas W. Hardwick, the best political strategist of them all, went down, rose again, and then went down apparently for good. He now holds a departmental position under the Republicans in Washington. "Little Joe" Brown, once the unique leader of one of the strongest factions, has buried himself among his books. "Jack" Slaton, at one time the most promising of the younger generation of public men, still is shadowed by the notorious Frank case in the dénouement of which he had a hand, however courageous, that since has meant his political relegation. Representatives of the great Georgia families, like the Cobbs, the Adamses, the Jacksons, now rarely are heard of in the politics of the state. In fact, in all the state's public life, though it still contains many good and some talented men, there is not one figure that is of more than state and only a few that rise above purely local importance. For the first time virtually in the history of Georgia, the state has not so much as one member of Congress whose head rises above the stature of the average.

The New Era

GEORGIA, whose political history is one of strong leadership, by men like James Jackson, William H Crawford, Alexander H. Stephens, Robert Toombs, Albert H. Colquitt, Joseph E. Brown, Henry Turner, now is virtually without political leaders. And in journalism, politics' twin brother, the state's poverty is almost as pronounced. It has many live dailies that are fine commercial successes but gone are the editorial pages which reflected the personality of a Grady, a Lamar, a Pendleton, a Patrick Walsh, or even a Thomas W. Loyless, who, still surviving, recently quit the game in disgust.

If one had to select the state's dozen most admirable editors one would look to its weekly press, now remarkably renascent, for at least ten of them.

The time was never more opportune, or the field more promising, for a political Moses to arise and show a people the way out of many complex dilemmas.

For a sort of new era is beginning in the state. The boll weevil is producing a rural revolution. The Negroes, upon whom the state is dependent for common labor and upon whom the lower type of politicians has relied too freely for agitational pretext, are leaving in thousands. Yet the state is not poor—it is so well off that there no longer is excuse for even the pose of poverty. The writer, when traveling through the southern section of the state a year or two ago when the joint operations of boll weevil and financial depression were causing what appeared to be all but universal bankruptcy, heard on every hand the following:

"We have everything except money."

The crass materialism which dominated the first and second now counts for less with the third post-Civil War generation which is becoming vocal. In the realm of education, where vast paucity still is to be found, no community is making more comparative progress.

Political Decline

THE least progressive of all fields of state thought and activity is the political. And the average Georgian has a passion for politics, and in times of emergency a perception supreme. During most of the time, however, politics with him is a game, the sport of sports, which he pursues more out of a spirit of fun than of fundamentals.

The state just now seems to be marking time politically while awaiting a new leader. Toward national politics the people of the state are even more nonplussed than in the case of state affairs. For McAdoo, a native of Georgia, they naturally have a sentimental fondness. However, unless someone more affirmatively to their liking permits them to assert a genuine desire in the premises they probably will leave the matter of the Presidential nomination largely to the politicians, as they have done in the past. And if the politicians fight it out among themselves, or reach agreement without a fight, the decision will be based on little having truly to do with political principle. It will rest more on state than on national politics and will connote more of incidental matters, like the state's membership on the Democratic National Committee, than of things fundamental.

And though a growing number of Georgians are straining at the chains which bind them to one party and are threatening after every national election to break away from tradition the state will continue, for some time to come, to sustain the tradition of the solid South.

Washington's Two Paleontological Artists

Fossils 20,000,000 Years Old Furnish Guide to Modern Industry

By RICHARD FREDERICKSON

IT SEEMS a far cry from the multiplied millions of tiny marine creatures incased in shells no larger than a grain of exceedingly fine sand floating in the shallow seas of a prehistoric age 20,000 000 years ago and the point of a whirling drill searching its way to the oil deposits of California, Texas, Wyoming, Mesopotamia—every part of the world where oil is sought. But there is a close connection between the two, all unsuspected by the general public.

MISS FRANCES WEISER

It seems a fantasy of a fevered imagination to see between the little mollusks which flourished in the days of the dinosaur and the modern city skyscraper any intimate relation—yet there is a relation.

Equally as incongruous seems a situation at once embracing these microscopic denizens of the ancient deeps, flannel-shirted, lace-booted geologists and drillers on plain and mountain watching the whirl or listening to the clank and thud of the oil drill, the dry-as-dust scientists in the laboratories, the denim-clad quarrymen blasting out the marble from the hills, the mollusks, and two quiet, patient girls—artists of rare ability and unique experience—tucked away in two cubbyhole offices in two great government buildings in Washington—the Smithsonian Institution and the Department of Interior Building.

To talk with these two women, one would never suspect from their quiet, unassuming demeanor that they are the only two individuals among the thousands of government employes who can do the work they are doing; that, indeed, they are two of a scant half-dozen artists in these United States who can do it.

And, too, little would one dream, as he watches them peering through queer binocular microscopes at objects the visitor cannot even discern on the plates beneath the object-lenses, that if these two artists should suddenly decide to get married or mayhap accept a position at some less arduous work, that a tremendously important part of the government's scientific geological work would instantly cease—and for years; that tears would start from the eyes of the aged and learned scientists hidden away among their thousands of specimen cases; that far out on plain or in mountain fastness, field geologists would pause with alarm at the news that these two women had "quit"; that oil-drill pilots would be filled with consternation and dismay; that, search as it might, the government would be years in finding someone to replace these two faithful, quiet artists, one of whom has been doing her particular kind of art for the scientific forces of the government for thirty years, and the other for twenty years.

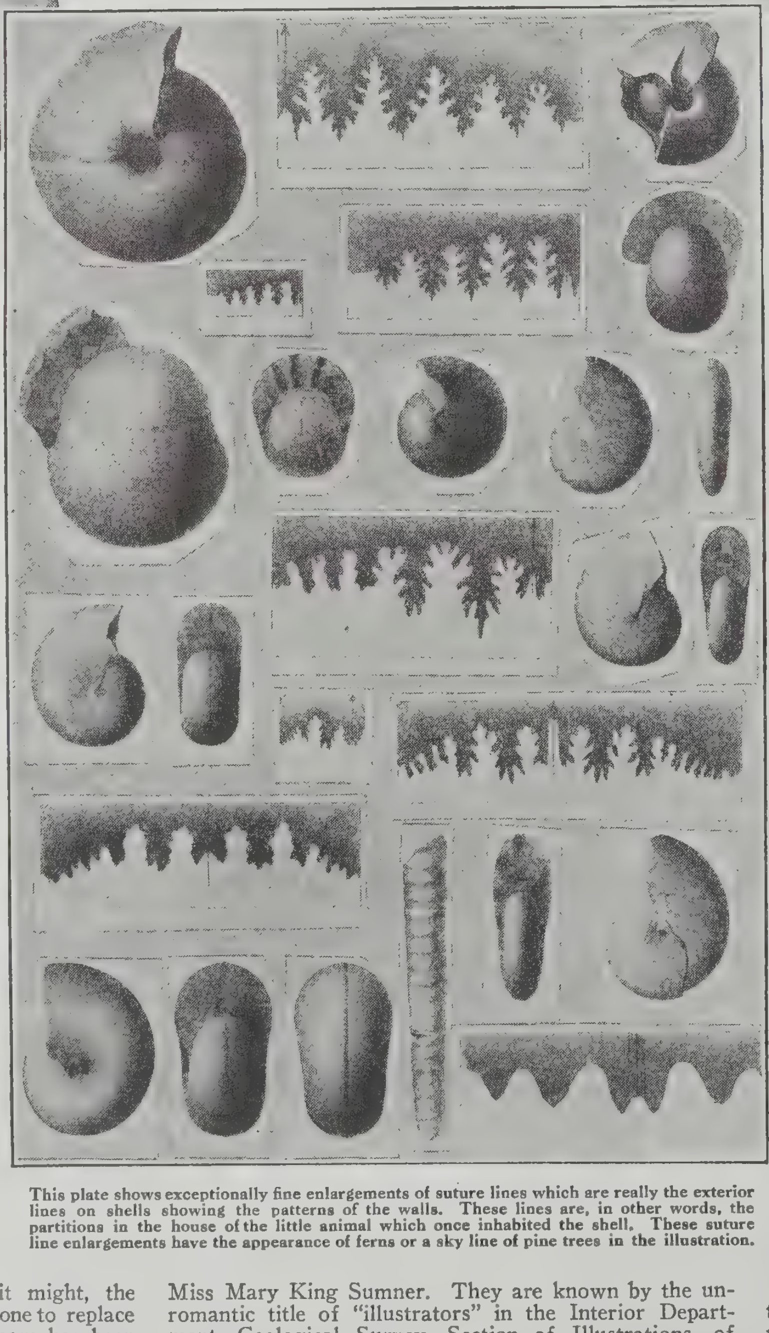
Not a day passes but scores of learned geologists in various parts of the world study the work done by these two women.

In the marble quarries, too, their work is pored over by men begrimed with a fine white marble dust.

Day in, day out, year after year, these two artists continue to gaze peeringly, patiently, through the eye-pieces of binocular microscopes and transfer to paper with their brushes what they see in that miniature world that the drill may be guided unfailingly to the oil hidden thousands of feet beneath the surface of the earth; that the quarryman's blast may seek that stone which will safely bear the crushing weight of the modern skyscraper with its burden of humanity.

Incidentally, a complacent government, careless of all this patience and skill, wasting millions, paying political favorites their many thousands a year, rewards the care and patience and talent of these two artists with a paltry $2,000 a year each, or thereabout.

MISS MARY KING SUMNER



This plate shows exceptionally fine enlargements of suture lines which are really the exterior lines on shells showing the patterns of the walls. These lines are, in other words, the partitions in the house of the little animal which once inhabited the shell. These suture line enlargements have the appearance of ferns or a sky line of pine trees in the illustration.

These two women, who thus stand, with their brushes and microscopes, as translators between the fossilized remains of the ancient, tiny-shelled denizens of prehistoric seas and the geologists, the oil-drillers, the marble quarrymen, the coal scouts, are Miss Frances Weiser and Miss Mary King Sumner. They are known by the unromantic title of "illustrators" in the Interior Department, Geological Survey, Section of Illustrations, of which Martin Solem is chief.

For thirty years Miss Weiser has been doing this particular kind of work, and Miss Sumner has for twenty years been tracing the intricate patterns she sees through her microscope, transferring them to paper that scientists may study and learn.

The instruments and implements these two artists use are fine microscopes of seventy-five magnifications, magnifying glasses of varied assortment, a complicated system of lights for getting certain peculiar rays, putty to hold the tiny shells in place so some vagrant breeze will not suddenly whisk the precious subject sought out by some scientist from millions of grains of sand or pulverized rock onto the dust of the floor, where it would be irrecoverably lost.

For, gazing through the microscope, the slightest shift of light ray or subject shows something entirely different from the object seen a moment before under some other arrangement.

The development of this fossil work, known under the general designation of "Paleontology," has been under way for nearly fifty years in the Geological Survey, yet, strange to relate, it is only within recent years the oil companies, quarrying companies, coal companies and other natural resource developers have known the value of this work. Now they all use it, and some geologists, more fortunate, perhaps, than others, are being paid princely salaries for studying and classifying the fossils brought to the surface in the drill cores, that the drillers may know whether they are in an oil or coal producing zone, above it, below it, or in a non-productive formation.

The age of the shells varies from 5,000 000 to 20,000,000 years. The shell fossils, taken from drill cores, are usually about the size of a large cambric needle point. Take a pencil, sharpen it well, then with it make the finest dot you can to be visible to the naked eye and you will have an excellent idea of the size of some of the shells with their intricate, beautiful patterns you see pictured herewith.

The geologists in the field, armed with microscopes, search the sands in the drill cores and with the point of a camel's hair brush dipped in gum arabic, carefully isolate and remove these shells. They are then mounted on plates and sent in to the Section of Illustrations, together with a description of the location in which they were found, their size, significance, and so forth. Hence, since the shells cannot be photographed, it is of the utmost importance that the artists show each line suture, and so on, for even the shape, size, the form of the lips, the pattern of scroll or fluting—a thousand details which the untrained eye, even aided by the microscope, would never discern, have to be noted and faithfully portrayed.

Drawing the shells is much more difficult than the task of an artist making an accurate portrait, drawn to the finest scale, of a man *one hundred and twenty-five times larger than the man, showing every mole, every freckle, every line, hair, the pores of the skin, that many times enlarged!*

These two artists spend hours studying the subjects, adjusting light rays, turning the shells this way and that to be sure they are getting the correct refraction—in other words, the accurate vision of the shell. Then carefully, patiently, each line, each dot, each scroll and spine is drawn, measured with the calipers, and finally, when the illustration is finished, rechecked. When it is found correct, the drawing is photographed and reduced to halftones and printed in "professional papers" issued by the Geological Survey.

For years geologists tried to describe by words these shells, but such intricate and minute subjects defy description as they do microscopic photography. Naught but the drawn picture will suffice.

The geologists in the field where oil, coal and so forth, are found take the fossil shell specimens from each successive formation encountered in drilling. They are accurately described and the location fixed; they are illustrated, and when found to occur invariably in certain formations where oil or coal, for instance, are or are not found, then the geologists for the drilling companies, looking through their microscopes at their fossil shells brought up in the core, consult the illustrations and the descriptions—and immediately know in what formation their drill is, and can tell whether they are in or out of a coal or an oil-bearing region or strata.

The paleontologist takes as much pride in his ability to identify each shell as to its family, habitat and previous condition of servitude, as does the art connoisseur in being able instantly to pick out a Rembrandt.

Would you ever suspect that a shell the size of a pinpoint that floated in the seas 20,000,000 years ago might have a great deal to do with the price of the gasoline you burn in your automobile? Yet, because of those descriptions and the elaborately patterned shell pictures, the oil driller is kept from spending money in barren zones and thereby adding to the cost of gasoline.

Eliminating Red Tape From Judicial Systems

Arbitration Society of America Promises Relief for Courts

By J. M. SEABRIGHT

YOU are a spectator in any trial court in the country. What do you see that impresses you most? Answer: Technicalities. As you leave, the words "incompetent, irrelevant and immaterial" drum at your ears, echoing what you have heard. Incompetent, irrelevant and immaterial! Technicalities and their legitimate offspring—expensive and vexatious delays!

And then the natural query lodges in your mind, "Can the red tape be unraveled? Or, better still, can it be cut?"

Until some time ago the answer would have been an emphatic "No!" But now all is changed—at least in New York. For in 1920 the legislature of that state passed an amendment to its arbitration law providing for arbitration courts unique in this country.

That statute carries three outstanding provisions:

1. Excepting in a small class of actions—such as criminal proceedings and suits for divorce—two or more persons may agree in writing to submit any actionable difference or controversy to arbitration and such written agreement to arbitrate is *binding* and *irrevocable*.

2. An arbitrator may be *any* person *selected by the parties*, and such arbitrator is endowed with power to subpoena witnesses, compel production of books and papers material to the issue, and, in almost all essential respects, to exercise the same authority with which a judge is clothed in the conduct of a trial.

3. The award of an arbitrator, upon application of either party, will be confirmed by a regularly established court of law, will be enforcible as a judgment of that court, and will be final—open to vacation only if procured by fraud, corruption, misconduct or excess of authority. From such judgment no appeal will lie.

Does Not Imply Compulsory Arbitration

NOW, don't throw up your hands in horror and shout derisively, "Compulsory arbitration!" If you do, you are in error. Compulsory arbitration means that parties are *compelled to arbitrate*. Here there is nothing of the sort. The *initiation* of arbitration—the agreement that you will arbitrate—is as free and untrammeled as the winds; the compulsory feature is merely the arbitrator's *decision*. In other words, the law does not say, "Bill Jones, you must arbitrate your differences with John Smith." It simply decrees, "Jones, if you agree to arbitrate your differences with Smith—agree in writing—then the decision of the umpire is as final as in a major league baseball game; and you are in no position to complain, for *you* helped to choose him!" And, as anyone can readily see, if the finding be not binding, the whole proceeding is as ineffectual as the efforts of a water lily against Niagara.

All this brings us to the work of the Arbitration Society of America, a "Membership Corporation" none of whose officers, governors or members can profit through its operations—an institution designed to confer its benefits upon the public at large.

From its charter we learn its chief purposes: first, to conduct a nation-wide campaign of education in promotion of the general cause of arbitration in all disputes and differences; second, to organize, equip and operate in New York City, and later in other large cities of the country, tribunals of arbitration patterned after those already established in New York; third, to have enacted a uniform arbitration law in all the states of the Union, and to encourage the insertion of an arbitration clause in all trade and industrial contracts. And here let me say that, for the present, the society will not extend its influence to the settlement of industrial disputes, for its sponsors feel that in that field mediation and conciliation are far superior to arbitration.

I said before that technicalities—red tape strangling poor litigants and curbing their freedom before our courts—constitute the most powerful drawback to the proper administration of justice in America. That is a serious indictment, yet who will doubt its truth? And the average litigant realizes its truth once he has taken a judicial bath, which slops over him but never cleanses. Of all such unpleasant and expensive experiences the Arbitration Society will relieve him; not only will—it has. For its work has passed the experimental stage. No mere toy, no idle dream, no fine-spun theory; instead a smoothly running machine functioning with greater power as its bearings become oiled with the lubricant of use.

Delays of justice one sees in congested court calendars everywhere. While they are proverbial, tinged with the whiteness of age, are they becoming worse. The rising tide of litigation engulfs our courts and exhausts our judges, who must struggle desperately to keep their woolsacks above the ever-rising surface. In New York County you will see a typical situation when you glance at the following figures relating to the trial term calendar:

Number of cases pending	21,380
Number of cases pending December 31, 1920	16,402
Number of cases pending December 31, 1919	12,419
Number of cases pending December 31, 1918	10,744
Number of cases pending December 31, 1917	10,265
Number of cases added during 1921	13,223
Number of cases disposed of during 1921	8,938

A sporadic case? Far from it: New York's situation echoes that of each of the great centers of our population. In fact our foremost bar associations, recognizing the gravity of the state of affairs, have committees at work on the problem. Meanwhile conviction is growing that the only solution lies in arbitration. With the public behind it the society hopes to relieve courts of 75 per cent of their cases, the bulk of them being that type of controversy which while insignificant yet requires the time and attention of judges—time which might be more profitably spent on cases requiring a deep knowledge of law. That is, these arbitration tribunals will not attempt to rival, but will cooperate with, the regular courts of justices. They will not be conflicting; merely supplementary.

To imagine a typical case, here is what happens. John Doe has worked for Richard Roe as a bricklayer. Doe's contract of employment provides for double pay for holiday labor. The contract is silent on arbitration. A controversy over wages for labor performed on a Fourth of July arises. Doe and Roe cannot agree. Doe sues Roe. The case lingers on the court docket for months—possibly a year or more, through congestion or manufactured delays on the part of some shyster lawyer. The amount in question is not large, but Doe needs his money. Yet he must await his turn. Finally, the case being called for trial, Doe and Roe appear in court, accompanied by counsel more or less learned and more or less tricky. Here Messrs. Doe and Roe catch a glimpse of an American court of justice, so called. Doe finds that he hasn't much of a case after the lapse of a year, his star witness having died. Time and tide wait for no man, but every man must wait for the courts. But that isn't the only exasperating feature. Doe grows fidgety listening to incessant squabbles over the admission and rejection of evidence, to verbose hypothetical questions put to high-priced experts, to skillful maneuvring of hair-splitting attorneys, to eloquent argument and emotional appeal in a matter calling for neither. And winner or loser he leaves that court room a disgusted and a discouraged man.

Lawyers Thwarted—Time Saved

SUPPOSE, however, he had been farsighted enough to have included an arbitration clause in his contract. He and Roe would then have visited the society's offices and chosen an arbitrator—preferably some one connected with their particular craft of bricklaying—from a list of more than 300 available arbitrators—names classified and indexed according to profession, trade or occupation. In accordance with their own agreement either the loser, the winner, or each of them on a half-and-half basis would have paid the society a fee of $10 if either or both were financially able; if not, their case would have been heard anyway. None of that fee goes for anything except necessary expenses such as overhead, the expense of a shorthand reporter and the cost of the arbitrator's oath and of the preparation of his finding and award. (The arbitrator usually performs his services without charge. On occasion, however, he receives a fee—agreed upon by disputants and arbitrator—from $10 upward, the amount depending upon the litigants' financial ability and the importance and complexity of the issues involved.)

Mr. Arbitrator designates a time for the hearing, and Doe and Roe then appear before him in one of the court rooms maintained by the society. The procedure is simple and direct. Doe states his case, produces his witnesses, if any, and submits whatever documents are material. Then Roe does likewise. There are no rules of evidence. Each party tells his own story in his own way, and the arbitrator, exercising common sense, knows what to consider and what to reject. It is an honest, fair proceeding steeped in common sense—the kind of proceeding that men with honest differences and honest purposes will desire.

Disputants need not be represented by counsel. They may have such assistance at the hearings if they so desire, to insure a clear and helpful presentation of their cases; but this is not essential. And even if a party's lawyer be present he can do no harm: he has been shorn of his power to sequester and manipulate.

Mr. Arbitrator, having heard all the evidence, announces his finding, and from it there is no appeal, no motion to arrest judgment, no new trial. What a relief to plaintiff or defendant! What an eye opener to members of the bar—a hint that they themselves should clean house! What an aid to overworked judges!

A happy result flowing from this arbitration scheme concerns issues involving a trade custom or practice, in which event no costly experts need be used as witnesses. In a law court each side would place experts on the witness stand with one inevitable result—a jury hopelessly confused by conflicting testimony. In the society's tribunal of justice you will detect a changed complexion: the arbitrator will write, say, 30 letters to as many prominent members of the trade in question, asking for the desired information. Thus at a nominal cost a like result is obtained.

No Publicity on Records

IN CASES involving trade secrets one notes a further advantage over the old system. To arbitration tribunals persons will gladly bring their controversies, knowing that, if the hearing results in a revelation of confidential matters, there will be no damaging notoriety—no publicity beyond the title of the case and the award as they will appear on the arbitrator's final record.

And still another advantage is seen in the fact that, instead of being restricted to a particular judge or jury, under arbitration the parties may select whomsoever they please from a long list of high-class "civilian judges"—men from all walks of life, men of unquestioned ability and spotless reputation for fairness and integrity.

"Who," I hear you ask, "are behind the society?"

Among the directors you will find such men as Emerson McMillan; Justice Charles L. Guy, of the New York Supreme Court; General Samuel McRoberts, president of the Metropolitan Trust Company; James A. O'Gorman, former United States Senator and Supreme Court Justice; Frank H. Sommers, dean of the New York University Law School; Dean Harlan F. Stone, of the Columbia Law School; and William C. Redfield, former Secretary of Commerce.

Judges, needless to say, are ardently supporting the plan. Assistance for them it means; not an ousting of their jurisdiction—at least jurisdiction worthy of judicial brains and effort. But—how about the lawyers? Does it not mean the snatching of fat fees from before their very eyes? Stripped of legal phraseology the arbitration tribunal is a court without lawyers, yet it is backed by lawyers—I mean the better class. Of course, the shyster who tries to stir up litigation, who forgets his dual rôle of counsel and court official, who takes his code of ethics lightly or not at all—naturally he is opposed to the new state of things. But many others of the profession—whether majority or minority—heartily endorse it; for their ideal is to keep running the wheels of an orderly society, not to hinder them with the sand of barratry.

"What have been the results thus far?" I hear somebody ask.

The first case submitted for adjudication was entered May 13, 1922. Since then hundreds of civil matters have been decided through the society's efforts. J. W. Slaght, the executive secretary, says: "We are gratified at the results achieved to date and are especially pleased by the knowledge that arbitration tribunals in the trades are receiving constantly more attention. Chambers of commerce and boards of trade, civic organizations, trade associations, and fraternal societies will be associated with us in a state-wide educational campaign to be known as 'Arbitration Educational Week.' Our physical facilities for conducting arbitration hearings are as yet limited, but plans are on foot for the acquisition of more centrally located headquarters, where night sessions of the arbitration tribunal will be possible."

The American press has given the society's efforts wide publicity. Editorial comment has unanimously favored it. In these days when the poor man finds himself almost a pariah before our courts; in these days when courts are often instruments, not of justice, but of injustice; at a time when the public's faith in them must be rekindled, that Bolshevism may be met and stamped out—no more propitious moment could have come than the present for the launching of the work of those public-minded men who are bent to the task of keeping justice blindfolded as litigants come before her.

The Teaching of Statesmanship

Concluded from page 2

boards are experts on the Constitution of the United States, as well as on matters of legislative usages prevailing in Congress. They also have a knowledge of the law. The members of the board are not members of Congress."

"Are the proceedings and rules of Congress based on general parliamentary law?"

"Yes, they are to a degree, but Congress has developed a parliamentary law and rules largely its own."

It will be seen that the "school for beginners in Congress" or the symposium, as Mr. Page designates it, dealt with the most practical matters in his endeavors to break in the novices for a beginning in the game of of being Congressmen. The idea of the one session class for "Freshmen" Congressmen originated with Mr. Page. After consultation with leaders in the house it was decided that Mr. Page try the plan out two years ago, as stated above. It is now thought that it will be permanent, as a single class institution for each incoming Congress. The Senate, as yet, has not adopted the plan and "baby" Senators must break into their careers as statesmen the best they can. Mr. Page's plan is a voluntary one and is not legalized by any law, rule or order. The new members can attend or not, as they choose. But it has proved to be very popular and well attended.

When the question, "Are members of Congress immune from arrest?" was asked, Mr. Page might well have quoted, as part of his answer, the following from Confucius, written 551 B. C.: The emperor of China questioned Confucius on a point of government, saying: "Ought not I to cut off the lawless in order to establish law and order? What do you think?"

Confucius replied: "Sir, what need is there of the death penalty in your system of government? If you showed a sincere desire to be good, your people would likewise be good. The virtue of the Prince is like unto wind; that of the people, like unto grass. For it is the nature of grass to bend when the wind blows upon it."

Haleakala, the Enchanted

Concluded from page 6

Then over the low, gray, rocky crater wall we peered into the crater, and there what we saw rendered us speechless. A yawning chasm as far as the eye could see, all brick red, gray and black, no sign of life or vegetation, the floor of the crater as black as if the fires had gone out but yesterday. Eight miles long, twenty-three miles around the rim, and two thousand feet deep is this huge hell pit. So deep is it that many cones rise from its floor eight hundred feet high, and yet from the top look insignificant. The whole of Manhattan Island could be buried a quarter mile deep in this chasm. From where we looked down it was not a sheer drop to the bottom, but an incline too steep to keep one's footing on the loose lava cinders.

"There are dogs in the crater," our guide explained, "a strain of bulldog that has run wild. And there are herds of wild goats. These often come through the gap. Water down there is very scarce, only in a few blow holes, and you have to know where they are. Occasionally a horse will break away at night and if he is not found will wander around until he dies."

We tried rolling stones down the sides of the crater, curious to see how long they would take to reach the bottom. They rolled, bounded, struck other stones, glanced off and always disappeared in the far, far distance, still rolling.

Swiftly the clouds in tumbling masses rolled in through the gap, filled the crater, and hid everything below from view. Upon this followed what sunrise in a clear sky in the arctic must be. The fleecy white clouds below looked like an ocean of snow and icebergs into which the sun dropped—no afterglow, and little reflection even on these icebergs; a short twilight; then darkness.

"But the days are longer than they would be," said the lad. "According to Hawaiian legend this is the spot where Maui the demi-god, overcame the sun—but perhaps you have never heard the story?"

"No, please tell us," we begged. So slowly filling his pipe, he began: "Maui, after whom this island is named, one day sat watching his mother Hina as she was making tapa cloth from the inner fibers of trees. The ancient Hawaiians used these tapas for draperies, couch covers and many things.

"Day after day Hina spread out her tapas to dry, but night after night she had to take them in wet because the sun shone so short a time that they were never dry, and the next day they all had to be hung out again.

"Maui was so filled with pity for his mother that he determined to force the sun to go more slowly. He watched the sun and saw that in its course it went directly over Haleakala. Then he made a long, strong cord from the fibers of many cocoanut husks.

"Armed with this he climbed Haleakala and waited for the sun. As the first long beam appeared over the horizon, Maui lassoed and broke it off, and repeated this until he had broken all of the sun's strongest beams. Then he commanded the sun to go more slowly. That is the reason why the days are longer in summer than in winter. This mountain should properly be called Aleheka-la (sun snarer) and not Haleakala. And now pau with the stories—let's have supper."

Our guide had already unloaded the "kau kau" from the pack horses and spread it out on the ground. Had we been going through the crater carrying meals for a week, we should probably have taken, as the Hawaiians do, jerked beef and poi, the starchy paste made from the taro root, the chief food of the old-time Hawaiians. But since we were to spend only the night, our supper was one such as might be carried on a picnic in any other of Uncle Sam's domain; sandwiches, salad, coffee and pineapple, this time canned.

A one-room stone house had been built here on the summit for travelers and a corral further down the mountain for the horses. The guide made a fire inside the hut and spread slickers on the dirt floor for us. Each wrapped a blanket around him and wearily turned in for the night.

There had been much talk by the natives of mountain sickness. "You may feel it in the rarefied atmosphere on top of the mountain," said our hostess at luncheon, "if so, don't take coffee; whisky is the thing," and some was provided.

I awoke about two o'clock. The room was thick with smoke. There was no air. Everything turned black before me, and I lost consciousness. "Mountain sickness," I murmured as I came to. "It's got me—whisky," and I staggered outside into the fresh air, while the sleepy guide, only half awake, began to replenish the fire, thinking that was what was wanted.

It was cold outside, almost freezing, but seemed better than that smoke-filled room, so there, wrapped in a blanket, I lay on the ground for the remainder of the night. The others I soon persuaded to go back inside.

Never had I imagined such death-like stillness as out there. Above the clouds, above the timber line, no wind, none of the night sounds—and that sinister awful crater yawning a few feet away. Even the Southern Cross in that cloudless sky seemed nearer. One sound now and then broke the stillness, I wondered if it could be one of the wild goats that had wandered through the gap—but nothing seemed to matter very much, for I wondered if I would live through the night.

Sunrise at last and all was well. We would have slept through it and missed a vision of wonderland, had I not been outside. The crater was still filled with clouds. Then slowly, as the sun rose over this cloud-ocean of billowy snow, tipping each peak with rose and gold, the clouds melted away, and we could see the real ocean and sapphire sky, the islands of Molokai, where is the leper settlement, Lanai, the barren island, and Maui, upon which we were, and also the mountains of Mauna Loa and Mauna Kea rising snow-capped above Hawaii, a hundred miles away.

After ham and eggs and some of the native coffee grown on the island, we swung into the saddle and started around the rim to White Hill.

The silversword is the only plant that grows inside the crater. Like the yucca it throws up clusters of flowers which look like huge, furry, silver gray, petrified chrysanthemums and grow only here and on the slopes of the Himalayas. Some of these were the only souvenirs that we carried away. Though mashed flat I think I have mine still, as silver and furry as ever.

"We must start back," warned the guide, as guides everywhere seem to have the unpleasant habit of doing, and reluctantly we turned our horses' heads homeward and started on the downward trail. Off at the horizon the sapphire ocean seemed to be on a level with us.

"I had heard," said Elizabeth, "that the higher we climb the higher the ocean would seem to rise at the horizon, but I did not believe it. Why it looks like a huge bowl."

"A match for old Omar's inverted one above us," grinned the lad. "They have matched their blues pretty well, it seems to me."

"You did not see the circular rainbow today, I feel sure," remarked our hostess at Idlewilde.

Then we were told that semi-occasionally, when the weather conditions were just right, that is, a rainy day below, the sun shining above, and the crater filled with clouds, one can stand on the rim, and the afternoon sun behind him will throw his giant shadow over the crater clouds, and around it will be the complete circle of the rainbow.

"Lost our only chance of a halo!" murmured the lad.

Lunch over, once more we swung into the saddle. Hotter and hotter it grew as we descended to tropical temperature and the land of the flaming hibiscus and sugar cane.

Back to Paaia we went by the same route, and after a two-hour wait for the "cannon ball," we steamed into Wailuku about four-thirty in the afternoon—hot and weary, but with a never-to-be-forgotten vision in our souls.

Switzerland and the Co-operative System

Concluded from page 9

tional groups to exchange goods where profitable or necessary. This is the dominating idea that is discussed and planned at each one of the international meetings.

The national co-operative organizations in Europe have met for twelve years in international meetings. In 1924 they will assemble at Ghent where they expect to put on a notable exhibit typifying the growth of co-operation in the various nations.

The more rapidly the international trusts develop and the more severely the pressure is put upon the ultimate consumer by them, the shorter will be the time when the contest between the international trusts and co-operatives takes place.

It is not to be understood that the great consumers' co-operative movement will ever put private business out of existence. The majority in the upper middle and wealthy classes will probably never join it, since financial pressure which is one of the main causes for co-operation does not operate on the well-to-do. This does not signify that the trusts will survive. They must have the patronage of the artisan and peasant to feed upon.

But when this armageddon does take place the trusts will realize for the first time the handicaps to which they have subjected themselves. In the co-operatives they will meet an economic group that is not loaded down with the weight of watered stock, since there is no way in a consumers' co-operative to inject water, whereas with the trusts it is practically impossible to imagine one that is not carrying water. The co-operatives expand and produce only when necessity requires since there is no incentive to profits. There is one chance for the co-operatives to have an oversupply of goods, and that is when they have an unwise manager. Sometimes in the event of a sudden drop in the price of goods they sustain a loss. Again the whole co-operative scheme is based on the elimination of the middle man, whereas the trust usually deals through this additional agent.

The banking question will also be a feature in this struggle. Trusts need bankers and have to pay their bonuses and interest. If there is one thing the Consumers' Co-operatives are doing in Europe, it is to eliminate the private banker. This is true also of most of the agricultural co-operatives.

When the time comes, the co-operative banks of one international group will undoubtedly assist the others as against an international trust, or there will be one great central international bank in which each one of the national or international co-operative groups will own shares and from which they can draw sustenance.

The greatest ally that the co-operatives will have is labor. In fact, this movement in the cities has in most instances emanated from labor organizations and gone hand in hand with them. Today at Geneva at the League of Nations, the Labor Division is surcharged with life and energy, and whatever the rest of the world may be doing, Labor is drawing its forces together in an international hand and co-operation is going right along with it. One of its divisions is studying the co-operative movement and has a liaison officer who keeps in touch with it.

But the Consumers' Co-operatives, to have an unbroken line, must in all countries consider the farmer and his societies. Either these city consumers' organizations must place their stores and societies through the country where the farmers can join them, as is done in Finland and other northern countries, or they must devise some other means of bringing the farmer into their organization or allying him with them. I can see many reasons why the farmers' organizations should be given every assistance and consideration. It has been demonstrated in Russia and other European countries that no economic movement of the city can succeed without the co-operation of the farmer. Moreover, the farmer cannot control the production of his farm with the certainty that the consumers' organizations can operate their business. He must always have a selling organization for the surplus of an unusual harvest that gives him more than his community needs. In addition, there should be sympathy for his organization because when in buying the farmer's fertilizer machinery, and so on, for him it performs a service similar to that of the city consumers' organization for their members.

The co-operative organizations, generally speaking, say they have given up hope of being fairly represented in the press of Europe. While I was there I frequently read articles in the newspapers charging them with being communists. In some parts of Europe I discovered small unimportant communistic co-operative organizations, but it is the height of absurdity to say that the great co-operative movement is communistic. It is built along entirely contrary lines. One of the incentives of the whole consumers' movement is that each person shall get dividends in proportion to the amount that he purchases. With the farmers, the dividend to each one is based on the amount he sells. Most co-operators believe that public utilities should be controlled by the government, but who would assert that this makes them communists?

In many countries, the most enthusiastic co-operators I met not only had no intention of merging their nation's sovereignty with other national movements, but were wildly enthusiastic about developing their own racial ideals. These ambitions never ran along war lines but were invariably peaceful in their aims.

On the other hand, the thought of a central clearing house for all their international problems has been in a sense symbolized by the League of Nations and its establishment at Geneva. Their leaders confidently believe that it is only a question of time when they shall have an international league of co-operators.

They have also seen what might be done with a central bureau of information for co-operators, fashioned along the line of the International Institute of Agriculture at Rome, which has the support of many nations and which issues monthly bulletins on economic and social questions, informing the public of the latest news on agricultural co-operation.

Among all the nations visited, whether they had been allies or enemies in the late war, there was an intense desire among the consumers to forget the past and come together along economic co-operative lines.

Joseph C. Lincoln Has Reclaimed Cape Cod

Concluded from page 5

old deep sea captain, the coasting skipper, the longshoreman or the people of the Cape Cod villages, I have done my best to portray each as I have seen and known specimens of his or her kind. But I have endeavored just as sincerely never to draw an individual portrait which might offend or hurt. And in attempting to transcribe the habit of language, I have made it a rule never to use an expression or idiom I have not heard used by a native of the old colony."

While all his novels deal with Cape Cod characters, many of the settings are away from the Cape. In "Cap'n Warren's Wards," he took the Cape Codder to the city and showed through his character delineations his high sense of right and wrong. In "Kent Knowles," the hero is taken to England. But it is always the development of the sterling, rugged Cape Cod character that is attempted.

"Shavings" made the real hit among the Cape Codders. It was the story of the quaint, unbusinesslike windmill maker, and no sooner was it published than nearly every boy windmill maker on the Cape changed the name of his shop to "The Shavings Shop." One of these is still operating near Mr. Lincoln's home at Chatham.

Interest in Lincoln's humor and philosophy has extended to the literary clubs. Last year more than 200 clubs in the United States spent an afternoon program discussing his books. Meantime the author has been called upon by scores of eastern audiences to give readings from his poems and novels.

"Whether the type of old sea captain that I have portrayed is gone forever is the question," declared Mr. Lincoln. "Certainly each summer I find that the ranks have perceptibly thinned. The longshore captain is still there, many of the men who are not many years older than myself, but their viewpoint is not that of the man who has sailed the square-rigged ship out one morning with China as his destination. Since the war, the square-rigged ship has made its appearance again and the sailing vessel has become a valuable property. One thing is certain, however; if the United States is to have another set of men as were represented by the sea captains of the days of the clipper ship, they will have to be bred."

International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

The Science of Tapestry Weaving

SCIENCE is not only systematized knowledge but it is also that art and skill which is a result of classified knowledge. It is in the applications of science that the greatest common good of systematized knowledge is found. The results of applied science are seen in the general improvement of the conditions of living. Industrial and engineering development are examples of applied science. The solidarity and health of a state depends, in a very large measure, upon its industrial and engineering status. The arts and crafts depend, today, more upon science than ever before. The beautiful is a valuable human adjunct to the useful. It enriches life. Good living conditions, however, are the prerequisites to the ability to enjoy the beautiful. A state that develops in that manner grows normally. It is fortunate that in our country industrial and engineering developments have taken precedence over the arts because the future of our nation depends fundamentally upon the success of these basic human endeavors. In a flourishing state art will, eventually. find an enduring soil for growth.

Music, painting and sculpture are now grounded in science. The great physicist, H. L. F. von Helmholtz, in the year 1875, placed music on a scientific foundation with his famous work, "Sensations of Tone as a Physiological Basis for the Theory of Music." Wilhelm Ostwald, the illustrious modern chemist, made a careful study of the chemistry of paint, with the result that better and more enduring effects can now be obtained by artists who use the knowledge revealed by these investigations. The modern sculptor is not only an artist but he is also a craftsman and an engineer.

In view of these facts we do not wonder that science is intermingled with art in the weaving of tapestries. It is very difficult to produce an excellent tapestry. Great skill is required. The art is not new. It has been recorded that Metullus Scipio paid 800,000 sesterces and Nero, 4,000,000 for examples of the ancient art. Famous pieces of tapestry have come from the Italian, French, Spanish, Japanese and Russian looms. The American, William Baumgarten, has, since the year 1893, produced some notable pieces.

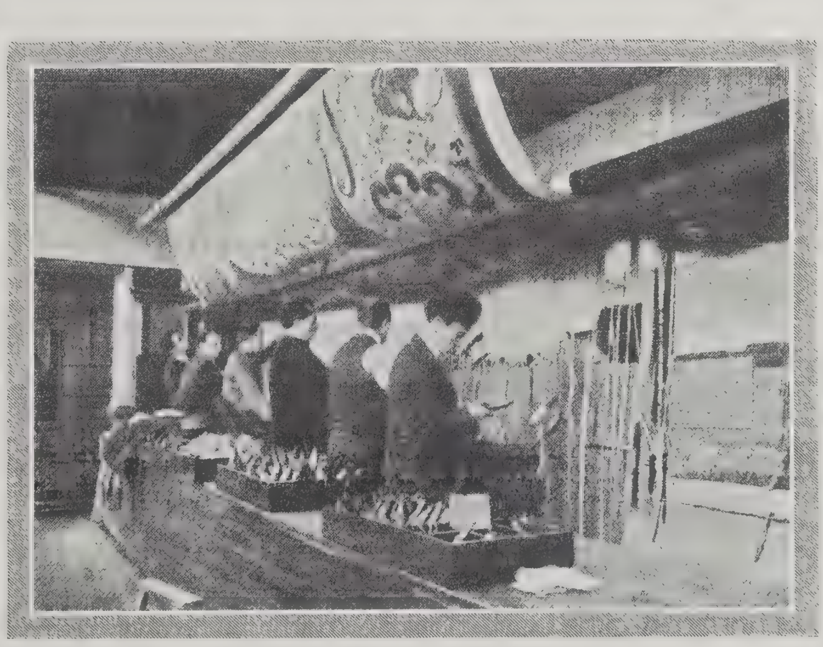
At the color-atelier of the Gobelin factory at Paris, the scale of color used includes about 14,000 distinct shades.

Tapestries are made by interweaving woof threads of various colors with either vertically or horizontally extended undyed warp threads. An instrument called a "*broche*" is used for the purpose. A "*broche*" may be said to be a combination shuttle and bobbin. The warp threads serve as the background for the development of the picture by means of the variously colored woof threads. At the famous Gobelin factory at Paris, a special color-atelier, or workshop, is equipped to dye the yarn and silk required for the production of the tapestries. The Gobelin factory produced tapestries for Louis XIV of France. This institution owes its name to Gilles Gobelin, who was particularly noted for his great skill.

That tapestry weaving is a science is evident from the fact that at "Manufacture Nationale des Gobelins" a school is conducted which offers three distinct courses to students. An elementary course in art, extending over a period of two years, serves as the foundation for the two advanced courses which follow. The intermediate course includes studies in weaving with two and later five tones or colors, decorative composition, and the study of fruits and flowers from nature. The advanced course is difficult because it includes the study of the representation of such subjects as the human body by the medium of the tapestry.

Tapestries are of two kinds, the "haute-lisse" and the "basse-lisse." In the "haute-lisse" looms the warp threads extend vertically, whereas in the "basse-lisse" looms they are horizontal. The basse-lisse process is more rapid. The warp threads are stretched in parallel directions like the strings in a piano. In a distance of one inch about 22 to 26 warp threads are stretched.

The work entails exceptional difficulties because the weaving is done on the wrong side and the finished portions face away from the artist. Considerable trouble is therefore involved in the examination of the work while it is in progress. The *haute-lisse* tapestries are generally original creations. The *basse-lisse* process is used principally for reproducing original works of art which are suspended above the artist as shown in the illustration. The haute-lisse tapestries are generally of greater excellence than the basse-lisse. This is due to certain advantages which the former process has over the latter.



One of the "basse-lisse" (horizontal warp) looms used at Beauvais, France. The copy or model is seen suspended above.

If a painter is dissatisfied with his work he can generally remedy the defect by repainting the faulty portion. The tapestry weaver does not have this advantage. It is a difficult task to modify, even slightly, any part of his work. The painter can easily pass from one color or tone to another color or tone. Shades and shadows can be produced with scientific correctness and artistic effectiveness. The tapestry weaver must produce all these effects by weaving in threads whose tones and shades vary so gradually that only the most highly trained and expert eye can detect the differences in their color values. That tapestry weaving is a delicate science is clearly evident from the fact that the scale of color used at Gobelins includes 14,000 distinct shades. A very definite science is required in conjunction with extraordinary skill to place these delicately shaded threads in such a manner that the combined result shall produce the color values sought. The desired effect cannot be produced by placing a thread of one color adjacent to another whose tone is too remote in the scale of colors. The blending of the threads must be of that gradual type that is distinctive of the spectral colors in the rainbow. This process of blending shades is called "*hatching*" and its successful execution depends not only upon a thorough scientific knowledge of the optical effect which will be produced by a certain massing of shades and tones but also upon an eye that is trained so accurately that it will distinguish shade gradations of the most minute order. The progress made upon high art haute-lisse tapestries which involve the human figure is so slow, because of the exceptional difficulties involved, that one is hardly aware of the surface completed in one day. To be precise, this amount is about four square inches. In one year of fifty-two weeks, at six working days a week, about one yard square can be completed. At "Manufacture Nationale des Gobelins" the actual cost of one square yard of this type of weaving is about $900 exclusive of insurance, rental of apartments for the weavers, taxes, and all the other overhead expense items.

The Swedish scientific journal *Vetenskapen Och Lifvet* states that Coomans and Deplanche were the first masters at the Gobelin works. These artists reproduced the paintings of Rafael, Roussin, Fremiet, Corneille, Fouquiere. and Lesneur in tapestries. We are indebted to this journal for the illustrations shown. We can only marvel at the precision with which these masters worked. One can hardly imagine that the eye and the memory can be trained to such remarkable precision performances. These astounding feats become even more marvelous when we make allowance for the fact that the finished work appears upon that side of the tapestry which is hidden from the artist. No longer do we wonder at the fact that from twelve to sixteen years of intensive study and careful training are required to develop a weaver of average skill and ability. The art itself required generations for its development.

The oldest existing tapestries were woven in Asia about 400 B. C. They were discovered in Crimea by the archeologist Stephani. In the Church of Saint Gereon, in Cologne, we find the oldest mural tapestries which were woven sometime during the 11th and 12th centuries. The Gobelins have a tapestry museum in Paris. There the student can read in the tapestries the development of the Gobelin art and science since the year 1603, when this institution was founded.

The art of tapestry weaving has developed harmoniously with the art of painting. The basic process itself has undergone but slight modifications since the time of the Roman poet Ovid whose description of the method used at that time indicates a great similarity with that employed by the Gobelins at the present time. The modern tapestry, however, is far superior to the ancient.

URBANA ILL

BRIEFLY TOLD

Although Japan has a total population of about 52,000,000 in an area the size of the state of California, two-thirds of the total area of the empire is forest land containing 1,100,000,000,000 feet of standing timber—about half of the estimated timber supply of the United States today. Japan has been practicing forestry for 400 years and it is one of the recognized principles of the country.

By a unanimous vote, the Legislative Committee on the Judiciary, at the Massachusetts State House, has voted against the plan to have the painting, "The Synagogue," removed from the Boston Public Library. The bill calls for the repeal of the act passed in 1922 requiring the Department of Education to take the painting by right of eminent domain, to remove it from the library and use it in connection with educational work.

To authorize the coinage of fifty-cent pieces in commemoration of the carving on Stone Mountain, and in memory of Warren G. Harding, President of the United States, in whose administration the work was begun, a bill has been introduced in the Senate.

Higher education is more devastating to the human race than war, according to Dr. S. J. Holmes, professor of zoology at the University of California. He is reported as saying that the prevalence of small families among the "highly intelligent" tends toward the extinction of "better endowed stock."

Shifting shoals of a sinking coast line on the Atlantic seaboard from the Florida Keys to Chesapeake Bay are proving treacherous. Charts now in use along this stretch of coast are antiquated and a re-survey is to be made to bring them up to date.

Details of a plan under which hundreds of hardy Scotch fishermen from the Hebrides would come to British Columbia to engage in the fishing business in the place of the Orientals were laid before the provincial government by Captain Ian Mackenzie, member of the House.

Czecho-Slovakia has its Teapot Dome scandal and five persons, including three Czecho-Slovak government officials, have been arrested in a scandal involving the sale of benzine to the Czecho-Slovak army.

The Houses of Parliament are in danger of losing much of their artistic beauty due to the dense fogs of London which crumble the stone.

Powerful electric locomotives operating in the Rocky and Cascade mountains pull the train up the grades of the Continental Divide. In their descent these same locomotives electrically brake the descent, and in so doing generate additional power which is returned to the line, making up in part that which is lost in ascending. Electrification does away with dirt, smoke and noise, doubles the capacity of a line, speeds up service, saves hauling immense quantities of coal, and is advantageous in every respect.

S. S. McClure has bought back *McClure's Magazine,* which he founded in 1893 and later sold. The magazine will return to the old size of 160 pages.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Ants manufacture their own home-brew in their digestive canal by the action of yeasts on the milky juices which they extract from aphids or plant lice, which they keep for that purpose, according to Professor Paul Lindner, chief of the fermenting industry institute in Berlin.

The real name of Kameneff, the vice-president of Russia, is Rosenfeld.

The highest fire lookout station in New England is in the heart of the Connecticut state capital. It is located at the top of the Travelers Insurance Company Building in Hartford where the lookout can see 250,000 acres of Connecticut woodlands.

More than one-sixth of the world's cattle are in the United States.

The German Government must pay $1,000,000 to United States citizens for claims arising out of the sinking of the *Lusitania* on May 7, 1915, according to a decision of the German-American Mixed Claims Commission at Washington.

There are 1,000 lepers in the United States.

The oldest building in the world still standing above ground is said to be a small square temple, built by the Sumerian king, Aannipadda, of Ur, about 4500 B. C. It is nearly twice the age of the relics found in the tomb of King Tutankhamen.

The *Almanach de Gotha* has quit publication.

Of 18,000 applicants for visas in Poland nearly 9,500 had no occupations.

Canada has more surveyed territory than any other country in the world, according to the president of the Dominion Land Surveyors.

Neighboring geysers of hot water are to be used in Reykjavik, Iceland, to heat the city. The geysers are within a mile of the city and have long been used for laundry purposes. Wooden pipes will carry the heat.

London fogs contain all the acid and irritating ingredients of poison gas and affect the delicate membranes of the throat and respiratory organs in a serious manner, according to a prominent London specialist in nervous diseases. Many children this winter have contracted "fog poisoning."

The Great White Way of New York City contains more than 1 000,000 incandescent lamps in 10,000 electric signs.

Nearly 1,200 highway billboards of the Standard Oil Company of California in Washington, Oregon, Nevada, California and Arizona will be removed as the company feels that the splendid scenery should be unmarred.

The Eskimos use the inflated skins of the leopard seal as bumpers and fenders for their water craft to prevent the fragile craft from being injured by the sharp, jagged edges of ice floes.

The coal resources of the United States will last 6,033 years at the present rate of consumption, according to the figures of coal statisticians.

Five women have been elected to local offices in Duxbury, Vermont. The town has a population of 631.

The *Mayo-Keno Bulletin,* "owned and edited" by Mrs. Marie Fotheringham, a well-known figure in the Yukon, is Canada's newest newspaper. It is made on a typewriter and is published Tuesday and Friday in Mayo, Yukon Territory. The *Bulletin* for $2 a month carries dispatches from London, New York, Washington, Moscow, Ottawa and other capitals. Advertising rates are a dollar a line and some fifteen lines are taken by as many firms.

Although the Hindus, like the Canadians, are subjects of the British Empire, they are excluded from Canada and even when admitted under special conditions they are refused the rights of citizenship.

The 13,000 tenants of the Equitable Building in New York City require twenty subway trains of ten cars each daily.

Virginia Strange, 11-year-old daughter of Representative Frank L. Strange, of Bowling Green, Kentucky, has the distinction of being the first girl page in the Kentucky state legislature.

Although King George released the rules about wearing court dress at royal functions when the Labor government came into power, many Labor ministers appeared at the first royal levee in all the glory of their blue cloth, gold lace, tin sword and glass shoe buckle outfits. The entire regalia costs about $650 and cannot be hired.

From Junk Man to Art Gallery; Auctions Catch Unwary Buyers

By a Metropolitan Observer

THE suit of $500,000 damages brought against Sir Joseph Duveen, of New York, internationally noted art expert, because he said that he believed a certain ancient statuette not to be genuine, was followed by the charge of M. Cornillon, of Paris, also an expert and reputed specialist on Gothic antiquities, that spurious antiques are housed in the Metropolitan Museum of Art.

This startled the population of New York City; from the humble owner of a copper ash tray to the proud proprietor of a whole private museum costing millions of dollars. It is said that even the Second-avenue tenement denizen secretly cherishes a kitchen chair which is credited as being an "early American" piece of furniture, and who will question the poignant tragedy of learning unexpectedly that the painted furniture made of birch of the 1797 vintage is, instead, cherry wood of the Buchanan period?

True, the great Cornillon says that "modern work or a copy of the ancient piece may be more interesting or more beautiful than the authentic ancient one," and that "selling an imitation of the real thing" to a person with the artistic itch is no crime, but it isn't, as usual, the money that counts, but the principle of the thing. The "principle of the thing" is the chief topic of Manhattanese discussion—and Manhattanites, native and foreign, are long on art, or are so conceded to be.

How can one be sure?

Easily; very easily. New York boasts very few junk shops or secondhand furniture dealers. Unlike other American cities, which consider that the "Slightly Used Secondhand Furniture For Sale" shops are a necessary pivot of business, New York has antique shops and interior decorators.

The Junk Man's "Art Gallery"

WHEN the junk man, with his pushcart or even the more pretentious motor truck, surmounted by one or two or three bells, pays the thrifty but innocent housewife $2.63 for discarded household objects, the great art machinery of the city is put in motion. In Omaha or Detroit the junk man would salvage what he could according to his methods, but in New York the thing is much more complicated.

The junk dealer has an "art gallery" of his own. He may not know it, but he has it. He is constantly visited by the numerous antique dealers and interior decorators that are about as thick as the chain groceries. It's a poor antiquarian who does not find an antique in the course of his peregrinations in these discard heaps. Thus a process of elimination means that what is not transplanted to an art shop in the expensive Thirties or Fifties (the great area where art is pronounced with the $ silent) must be cremated, buried or otherwise destroyed.

The collector is not supposed to know that so very many way stations exist between a piece of furniture and an *objet d'art,* for, in addition, if not spelled in French, it is not artistic, even though the *objets* are Levantine or Dutch. In fact, he is not supposed to know that the way stations are nothing, compared to the route a given *objet* travels, from maker to consumer; consumers, rather, because the more owners are interspersed the more valuable it becomes, unless it is a creaky reed chair or box-couch or ice-box. The "How to Make Your Home Artistic" pages of the domestic magazines inform one how to turn such a chair into a throne, emergency bed into a Turkish corner, and refrigerator into a jewel safe, but real antiques consist, primarily, of things wrought of metal, wood or china and glass.

"I bought the cunningest pair of candlesticks," one young lady was telling a friend in the street car; "and I believe they are Battersea enamel, and only $17.50!"

"How lucky you are, dear," the friend replied. "Why is it that chances like that never come my way? It's a gift, I suppose, yes, and luck."

The Value of Turnover

AS THE genuine Battersea enamel candlesticks will bring $500 and even more a pair—because I have seen a dealer pay $750 for three pairs at a dispersal auction, and he is not in the business for his health—the lucky young lady is doing her bit, indirectly, for American art, since her possessions must have originated somewhere in New Jersey, U. S. A.

The strangest thing about the antique business, either in this country or in Europe, is that dealers depend upon other dealers for their chief business. It rarely happens that a purchaser actually gets anything that is supposed to be or is artistic unless it has been turned over a few times. This is true of the commonplace piece of a few dollars as well as the rare object adorning private or public museums.

It was by mere chance that I stumbled upon the antique business and its intricacies of Manhattanese type, and to see "what was inside," I managed to become friendly with many of the dealers. In the course of a few visits I learned how to spot them at the auction sales, and by noting down on the catalogs the prices these dealers paid—and each and all of them have charge accounts in spite of the conspicuous warning, "Terms Cash Before Removal of the Goods"—I arrived at a fair understanding of fashions, values, prices and turnovers. I have seen dealers buy from one another right in the auction room after the particular pieces had been knocked down. One year the vogue is for bronzes, another for gilt furniture, another for Spanish furniture, another for china and glass, another for oil paintings, and so on. I presume this is a well-laid scheme of the interior decorators; it throws back on the market old marketable stuff and replaces it with a different style, and this process aids "antiquing."

How this works out may be demonstrated by the following experience of mine.

For some time I had been seeking a library desk of the Florentine school. One of the friendly dealers, at an afternoon auction, showed me a desk he had just bought for $15. It was one of the "slow days," for that sum had been paid for a magnificent mahogany desk, with elaborate carvings. Its double sculptured apron made it a piece that would sit handsomely in the center of any library or living room. Its only damage was the badly stained top—a matter of a few dollars. The piece did not fit with my scheme of things, but I thought that I might try a bit of antique-dealing myself by buying it for $17.50 and selling it or exchanging it for something more valuable, and I was sure that it was worth $100 in any trade. But he who hesitates is lost, and I hesitated.

And lo, behold! A week afterward another dealer sent me a card asking me to drop in. He showed me a desk I had seen before—and could have bought for $17.50. He had cleaned it and thus better than new, because it was the sort of cabinetwork turned out by master workmen of two generations ago. He asked "only $90," although he assured me it was worth $200 to throw it out of the window, by which he meant, of course, that even the pieces would have been worth two centuries. For, ah, in the antique business a $100 bill is a century. The computation is easily arrived at; anything worth a dollar can be safely marked $100. The dealer, therefore, who had bought it at the auction and offered it to me at a profit of $2.50, or one-sixth, sold it to a fellow dealer for $40, who straightaway marked it up $150 after expending a day's labor and material for refinishing. And the joke is that he sold it for $250.

How? Easily.

His method has been to mark on his price tags a figure preceded by the sign #. This figure is twice the selling price, which in turn is suspectible of a further deduction. But a woman walked into the art store, saw the 300, mistook the # for $, and thinking that she was very smart, offered $250!

Knowing How Much to Pay

AS THE antique dealers, either in modern antiques or ancient antiques, work together despite commercial competition, the prices are very nearly stabilized. In the midst of winter a week may witness six simultaneous sales. It begins with the American Art Galleries, which will disperse and sell, for actual cash, a million dollar—selling price—collection in three afternoons. At the Salomon sale last spring a three-piece garniture set for a drawing room mantel or console went for more than $200,000 to a dealer, which means that the purchaser will have to pay from 50 to 100 per cent more for it.

To be wary is the first element in auction buying, but above all in antique or art buying. One may ask how it is possible to be wary when art dealers dispute among themselves given art objects, and frankly denounce this or that piece, costing tens of thousands of dollars, either as suspicious or outright spurious. If the Metropolitan Museum of Art has actually bought "fabricated sculpture" faked in Europe for American trade, as Cornillon charged recently, what chance has the innocent once he is baited by the auction sign?

None at all. Outside of being so wary as not to buy at all the next best and safest method is to decide what a given piece will be worth to the buyer. It is safe to bid, in anything except rare objects valued for their historical background, a price not exceeding by many dollars the bid of any of the dealers or dealers' agents who usually are grouped in the rear and make their bids almost surreptitiously. When the first dealer withdraws, then it is safe to stop—for the private buyer. A few visits to these interesting auctions—and they are interesting not for the business of selling so much as for the chance to inspect and study the marvels wrought by labor in the past, so eloquent of patience and even love—will soon render one's eye practiced in detecting the dealers.

Responsible auction rooms have no cappers or bid boosters. Competition is usually keen and all bids are bona fide. There are auction rooms, of course, where the things auctioned off are actually not sold, despite the appearance of bidding, and the prospective buyer had better acquaint himself or herself of this type of alleged auction. There are three or four places in New York, to my knowledge, where certain Sévres vases, statuary and miscellaneous pieces have been cataloged and "sold" at every sale for two and three years. The sale has never been concluded because the best bona fide bid in every case happened to be less than the cost of such objects to the auctioneer (who owns them outright and is not selling them on commission upon order) and in general these objects represent the individual purchases from dispersal auctions and junk shops.

I know of two dealers—who call themselves auctioneers—who regularly visit every secondhand store and auction and buy there, for cash, such knickknacks or furniture which happens to survive the junk heap by sheer beauty, intrinsic worth or other quality. Strangely enough, these dealers often become so attached to some particular piece that they will not sell it as long as this love endures.

An auction presupposes a bargain, but all are not bargains that are sold at auction. One gets stung and that's part of the education, the only hope being that at last accounts the judicious purchases shall compensate for preliminary losses.

Above all, it is necessary to avoid the gyp auctions which flourish in the more popular thoroughfares, festooned on the outside with cheap oilcloth or bunting signs announcing a removal, expiration of lease, bankruptcy stocks and "We Need the Cash." These fictitious auctions, which the police departments of our cities have failed to eliminate, are absolute frauds. They do not sell furniture or artistic furnishing and decorations, but in the wild array of cheap jewelry and low-grade cut glass, optical goods, and plated silverware, there will often be found statuettes, miniatures, ivories, fans, and similar things which unless of no real value serve as decoys.

These auctions, run in fly-by-night style, as a rule on monthly tenancies, make use of a great deal of red blatant announcements, glaring and blinding illumination to give the sparkle to the wares. Sales are held, and one-cent bids are often accepted. Ten-cent articles, like collar buttons and folding toothpicks and earspoons—which the auctioneer declares every genteel person must carry, as it isn't polite to "use one's finger nails"—and combs and pencils, are put up every few sales.

"Gold" Watches—$7.00 a Dozen

MY FIRST defeat of this kind happened in London before the war, at an auction on Leicester Square. A "gold watch" was put on sale. One shilling? Yes. Hunting case "gent's watch" by which Charing Cross trains would be glad to run or stop. A couple of yokels from submerged Britain—and I happened to be the third—bade for it. Well, it went up to a guinea, or a fiver of our money. But the auctioneer was kind; he was altruistic. He added a gold chain. Then he added a gold-handled knife. Then a woman's watch. A long chain. A locket. A brooch. A diamond ring. The pyramid was wonderful. As yet the bid was being raised a few shillings at a time. It was worth the seven or eight dollars at which the collection was dangling, yet supplemental bids were difficult to obtain. Fifty pounds' worth, said the auctioneer. Well—he started with the watch again. It looked good, and I was an easy mark. I bid it in for eighteen shillings. That was, and has remained, the extent of my auction experience in London. I wore the watch one warm day, and the gilding, which was not even gold, stuck to my pocket lining. I was the owner of as solid brass a watch as I have ever seen. These watches, made for the "auction trade" herein referred to, sell from $7 to $13 a dozen. Yet human nature is so gullible that even the man with a $200 chronometer, once within earshot of the lusty auctioneer, hasn't the heart to see so handsome a watch thrown away for a couple of dollars. One auctioneer told me he sold an average of fifteen dozen watches of this type every day.

This auctioneer, taking me partly into his confidence, told me that the easy "guys" are the young fellows with a girl—those who like to make a hit with a showy piece of jewelry without sacrificing the next year's lunches. But the auctioneer was a cynic, too, when I observed that it was a cruel joke to play on trusting creatures.

"Huh?" he ejaculated. "My stuff lasts as long as their love affairs. An' it's a good thing; the guy is out less, because if he loses the phony stuff it won't hurt him none an' if it was real goods he'd have to whistle for it until the cows come home."

The Imaginary Bidder

PASSING by the auctioneer, therefore, who sells at auction a sealed box for ten cents, and will refund the money if after looking you are not satisfied that it is worth what you paid for it—this proviso and privilege is necessary to get around the lottery laws—one comes to the general art auctioneer who sells his own stuff at a bid which he is free, unknown to you, to accept or reject. He outbids you by calling an imaginary bid somewhere—and it would be difficult to prove that the bid was faked. The set-up price is absolute as long as he wills it so.

The trick is to obtain one or more pieces from some noted or notorious person, whose name adds a "front" and is a good selling point. Stage folks are supposed to be good pulls in this wise. Certain houses feature names involved in the news scandals. But it should not be taken for granted that the whole collection belongs to the owners or ex-owners named. The genuine art gallery announced, in print and on the catalog, a collection belonging to a given person or estate, and that goes as the final chapter of a more or less long pedigree. But when it is announced that it is the sale of Mrs. Whoozis, and then in small letters a postscript explains that "other properties" are included, the sale is off-color, even if not actually fraudulent.

Most sales are scheduled on Thursdays, Fridays and Saturdays. The average day's sale runs to about 200 lots, unless they are extremely complicated and valuable lots, and the best pieces are always reserved for the middle of the sale, with Saturday the prize day—the expensive day. In New York there are persons who are on the mailing list for catalogs and who attend sales as regularly as church, and perhaps oftener. Their buying may not be profitable, but the auctioneer likes

"The Greatest Single-Handed Fight in American History"

Thrilling Tale of Old Frontier Days Gives Way Under Rigid Investigation

By WALTER NOBEL BURNS

WILD BILL HICKOCK'S fight with the "McCandlass gang" is one of the classic stories of the West. It has been called "the greatest single-handed fight in American history." It has been printed countless times. As the fabric of many a penny dreadful, it has been read by thousands of boys of an older generation under their desks at school or in the sanctuary of the hayloft far from stern parental eyes. It has been repeated in books of a more pretentious literature by authors of reputation and become familiar to everyone interested in the history of the old frontier. So thrilling is this tale of desperate heroism, so picturesque in its quick, vivid drama, that it seems little short of sacrilege at this late day to impugn its veracity. But as it has been handed down by tradition and in type for more than sixty years, it is merely fiction, with little more than a basis of truth.

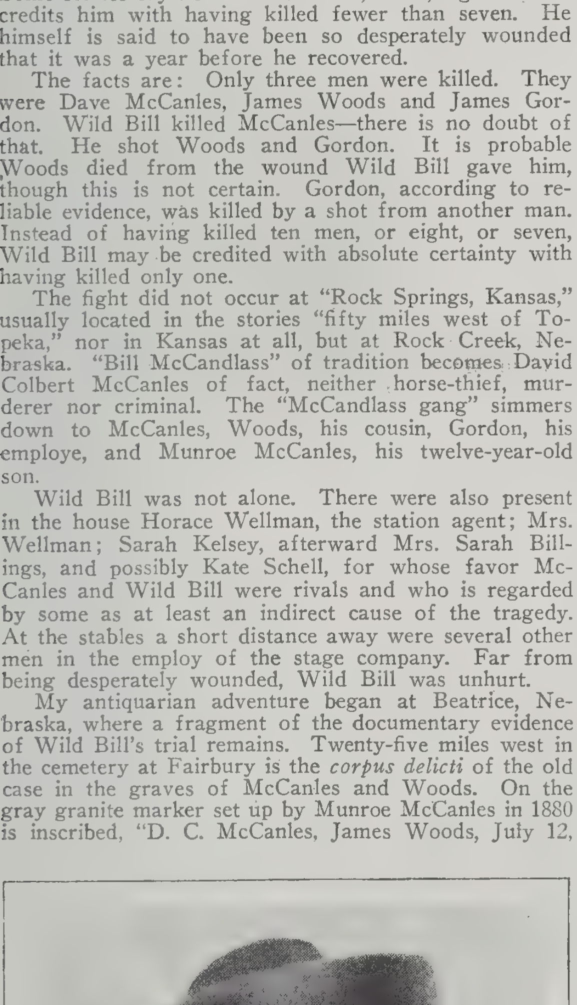
The old story runs in this way: Ten members of the "McCandless gang," bound on a horse-stealing foray, swooped down on the relay station of the Overland Stage Company at "Rock Springs, Kansas," at the outbreak of the Civil War. They were led by "Bill McCandlass," horse-thief, murderer, terror of the border. Wild Bill was alone. He barricaded himself in the cabin and when the bandits broke down the door and stormed the house, he emptied his rifle and six-shooter and then fought on with his bowie knife. Some stories say he killed ten men; some, eight. None credits him with having killed fewer than seven. He himself is said to have been so desperately wounded that it was a year before he recovered.

The facts are: Only three men were killed. They were Dave McCanles, James Woods and James Gordon. Wild Bill killed McCanles—there is no doubt of that. He shot Woods and Gordon. It is probable Woods died from the wound Wild Bill gave him, though this is not certain. Gordon, according to reliable evidence, was killed by a shot from another man. Instead of having killed ten men, or eight, or seven, Wild Bill may be credited with absolute certainty with having killed only one.

The fight did not occur at "Rock Springs, Kansas," usually located in the stories "fifty miles west of Topeka," nor in Kansas at all, but at Rock Creek, Nebraska. "Bill McCandlass" of tradition becomes David Colbert McCanles of fact, neither horse-thief, murderer nor criminal. The "McCandlass gang" simmers down to McCanles, Woods, his cousin, Gordon, his employe, and Munroe McCanles, his twelve-year-old son.

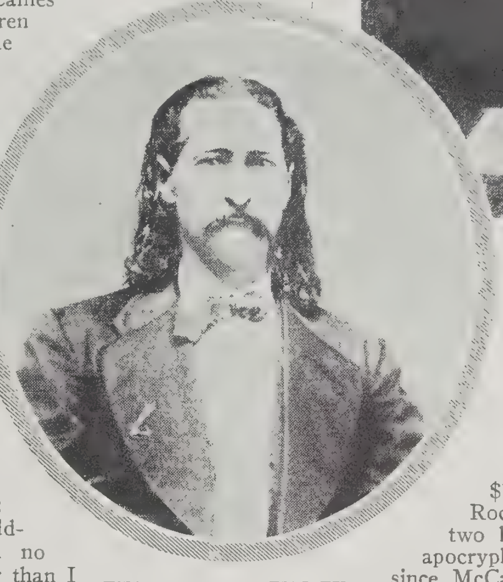
Wild Bill was not alone. There were also present in the house Horace Wellman, the station agent; Mrs. Wellman; Sarah Kelsey, afterward Mrs. Sarah Billings, and possibly Kate Schell, for whose favor McCanles and Wild Bill were rivals and who is regarded by some as at least an indirect cause of the tragedy. At the stables a short distance away were several other men in the employ of the stage company. Far from being desperately wounded, Wild Bill was unhurt.

My antiquarian adventure began at Beatrice, Nebraska, where a fragment of the documentary evidence of Wild Bill's trial remains. Twenty-five miles west in the cemetery at Fairbury is the *corpus delicti* of the old case in the graves of McCanles and Woods. On the gray granite marker set up by Munroe McCanles in 1880 is inscribed, "D. C. McCanles, James Woods, July 12, 1861." The inscription gives the authentic date of the fight and the authentic spelling of the McCanles name.



DAVE McCANLES.

I found Clingman McCanles and Lizzie McCanles, children of Dave McCanles, on the farm of Mrs. William Compton near the village of Endicott, seven miles southeast of Fairbury. Mrs. Compton is a daughter of "Irish John" Hughes and Dave McCanles' widow, who were married in 1865. "Irish John" is generally credited with having fired the shot that killed Gordon. Their tragic heritage still embitters the memories of these old people. Lizzie McCanles recalled with tears the "murder" of her father. Clingman McCanles said: "Wild Bill's act was cold-blooded murder. He had no more right to kill my father than I have to kill you."



WILD BILL HICKOCK.

Other children of Dave McCanles are still living. Munroe McCanles, now seventy-five years old, lives in Kansas City where he practiced law for many years. Julius McCanles lives in Florence, Colorado, Charles McCanles is a grocer in Denver. Leroy McCanles, a brother of Dave McCanles and associated with him in business at Rock Creek, died two years ago at Florence, Colorado, where he was a wealthy banker. Mrs. Dave McCanles died at the home of her son, Charles, in Denver, in 1904.

The site of the old Rock Creek station, four miles southeast of Endicott, is still plainly marked by large red stones, known locally as niggerheads, which formed the foundations of the house. Close to the west end is the old well, forty feet deep, lined with niggerheads and empty of water. No trace of the stables remains. Near by, Rock Creek flows under oaks, boxelders and cottonwoods. Deep indentations on its bank show where Dave McCanles' toll bridge stood. Rutted outlines of the old Oregon trail are discernible on a neighboring slope. Express trains now flash by the scene where once the Overland stage changed horses and the endless caravans of covered wagons went by. All about is the stillness of wooded hills and rolling farmlands.

Standing by the skeleton foundations, it is easy to orientate the old tragedy and to say with approximate accuracy, "There stood Wild Bill when the fight began"; "On this spot McCanles fell"; "There Woods stumbled to his death"; and "Yonder toward the old bridge, the doomed and wounded Gordon staggered in flight." Easy, too, with the aid of old descriptions, to reconstruct in fancy the old stage station, built of hewn logs, thirty-six feet long, sixteen feet wide, eight feet high at the eaves, with puncheon floor, open stone fireplace, stone chimney on the outside and a clapboard roof sloping both ways from a ridge pole. It was a house of a single room with an attic entered through a window in the east end by an outside ladder. Seventy-five feet to the northwest stood the barn, eighty feet long, twenty wide and constructed of perpendicular logs.

Bound for Pike's Peak during the gold excitement and accompanied by James Woods, his cousin, Dave McCanles arrived at Rock Creek from North Carolina in 1859. Seeing good business prospects in selling supplies to Pike's Peak argonauts and emigrants swarming westward over the Oregon trail, he bought Newton Glenn's ranch on the west bank of the creek and built a store. This became known as West Rock Creek station to distinguish it from East Rock Creek station which he built later directly across the stream. This latter place was sometimes known as Elkhorn station from a pair of antlers nailed above the door and was the scene of the Wild Bill-McCanles fight.

McCanles used the west-side station as a depot of supplies for freighters and emigrants and the east-side establishment as a relay station for the Overland stage and the pony express. His toll bridge, which he built across Rock Creek between the two stations, and for crossing which he charged from ten cents to a dollar and a half for each team outfit, brought him in a large revenue, as emigrant traffic was heavy. He employed from ten to twenty men at the two stations to tend store, take care of the horses and stock, give service to the stages, and freight in supplies for the emigrant trade from Atchison, Nebraska City and Fort Leavenworth. His business is said to have netted him from $500 to $1,000 a month. There is a tradition that shortly before his death he buried $10,000 in gold in an iron kettle at Rock Creek and marked the spot with two boulders. The story may be purely apocryphal but certain it is that many men since McCanles' day have dug industriously in an effort to unearth the hidden treasure.

ROSS HELVEY

At the grave of McCanles and Woods in Fairbury cemetery.

McCanles' wife and children joined him a few months after his arrival and made their home at East Rock Creek station. The domestic situation was complicated soon afterward by the arrival of Kate Schell with whom McCanles had had an affair in North Carolina and whom he established as mistress of the west-side house. Kate Schell was twenty years old. Some stories represent her as a gay, dashing, devil-may-care young woman who sometimes sat in at a card game with men and was not averse to a toddy. Others picture her as a quiet girl of some education and refinement. All agree that with her dark hair and eyes and trim figure, she was unusually pretty. Why, with Rock Creek dividing domesticity from romance, Mrs. McCanles, who was an intrepid woman, did not take matters into her own hands and visit summary vengeance on her rival, was a question often debated among the settlers. The bitterness between the two women, however, never reached the point of open vendetta and the reason doubtless lay in the submission of both to the iron will of McCanles. Kate Schell remains a mystery figure in the Rock Creek drama, stepping abruptly into view out of the unknown two years before the tragedy and immediately after disappearing into oblivion.

McCanles, who was twenty-eight years old when he arrived at Rock Creek, was six feet in height, weighed two hundred pounds and was of extraordinary strength. The daguerreotype portraits of him still in possession of his family show a bearded man with a merry eye and the robust look of a jovial buccaneer. His character and psychology are difficult to gauge even by the canons of his own wild times. He was a shrewd business man and became the richest man of his part of the frontier. He was dynamic, aggressive, belligerent, domineering, with an egotism that amounted almost, if not quite, to megalomania; yet he was generous, hospitable, unquestionably courageous, full of boisterous, roistering fun, played the fiddle and banjo and sang a rousing song. He was the champion wrestler of the countryside and reveled in a good fist fight. In a country without law, he arrogated to himself the right to punish cruelly and mercilessly anyone who violated his personal code of right and justice. He was a hard drinker, an inveterate gambler, immoral, if not unmoral, and a bully, but there is no record that he ever killed anyone or was guilty of any grave crime. Viewed through the perspective of the years, he seems to have been a jovial ruffian and, though bad enough, not half so bad as he has been painted. If he had enemies, he also had many friends.

Here are some anecdotes of this complex frontier character narrated over McCanles' grave in the cemetery at Fairbury by Ross Helvey who had located the spot for me. Helvey had the stories from his father, Tom Helvey, who, on the day after the fight at Rock Creek, assisted in the burial of the three dead men.

"Harry Goff, who worked for McCanles about the station, was a great fellow to get drunk," said Helvey. "McCanles had done everything to keep him sober but it wasn't any use. McCanles found Goff lying under a tree one day, dead drunk. He filled Goff's hair and beard with powder, and, laying a train of powder along the ground, called his men about to watch the fun. He set a match to the train and in a moment there was an explosion that left Goff hairless and beardless and came near putting out his eyes. Goff jumped up in a

Jewish Exploitation of Farmers' Organization

Monopoly Traps Operate Under Guise of "Marketing Associations"

By ROBERT MORGAN

A BAND of Jews—bankers, lawyers, money-lenders, advertising agencies, fruit-packers, produce buyers, professional office managers and bookkeeping experts—is on the back of the American farmer. Working occasionally in the open, usually behind a screen of well-paid Gentile "fronts," this organization has developed with such amazing rapidity within the past five years that its operations today extend from the Atlantic to the Pacific and from the interior of Canada to the Mexican border. If it is allowed to continue for another five years, not a grain grower, not a vegetable producer, not an orchardist, save one class in one limited area, will be able to escape paying tribute to it.

Born in the fertile, fortune-seeking brain of a young Jew on the Pacific Coast a little more than five years ago, and nurtured by a Jewish official who had the ear of one of the state governments by which he was employed, the idea has turned millions away from the pockets of the men who till the soil, and into the hands of the Jews and their followers.

With specious promises which never have been and cannot be fulfilled, these exploiters of the farmers, working together like the well-meshed cogs of a perfectly designed machine, are attempting to bring all the farmers of whatever class in the United States into various classified organizations called "co-operative marketing associations." As soon as these individual and local associations are formed, they are organized again into larger classified state and national bodies. These state and national bodies, one to each variety of agriculturist—grain, potatoes, fruit, vegetables, and so on—are to be organized, for a third time, into one huge controlling body, nation-wide, probably international, so that the Jews of Europe and Asia also may participate. So far this group has proceeded only so far as the state, or crop-territory, association.

This delay in the formation of the national Jewish "holding company" for the entire production of all the farmers of the United States is not due to any backwardness on the part of the promoters of the plan, but solely to interior disturbances in the local associations already organized. The majority of these disturbances have been economic, due to the fluctuating conditions of public demand and public ability to pay for the production of these associations. A few of them have been brought about by braver spirits in the local associations, who, seeing the direction affairs were taking, endeavored to save themselves and their fellow farmers from what to them appeared to be inevitable ruin. Most of these brave spirits either have been crushed by the machinery of the Jewish organization; have been won over to the side of the "organizers," sometimes by devious means; or have been forced to leave the local associations, through the efforts of Gentile "fronts" well and wisely "planted" in such organizations.

Reports that all was not—and is not—well with these new-style co-operative marketing associations, however, have spread to other and unorganized areas, and to other and unconvinced groups of agriculturists, with the result that, within the past year, there has been a marked indication of delay in the acceptance of the doctrines put forth by those seeking to get the control of the farmer's production away from the farmer.

That my readers may understand fully this effort to control, direct and regulate every farmer in America, and to take from him the profits of his labor without giving him adequate return, it is necessary to consider for a moment the forms of co-operation in existence prior to the Jewish movement on American agriculture. Co-operative marketing is the child of co-operative buying, and co-operative buying is almost as old, in one form or another, as accurate history. The Greeks knew the idea; the Phoenicians practiced it; the Egyptians were familiar with it.

It came to America through Denmark and Sweden, was improved in this country and went back to Europe. It is a success, wherever it is tried by honest men, because *quantity buying reduces cost.* The co-operative selling plan is not a success mainly for the reason that *quantity selling automatically reduces the sale price*, the converse of the reason for the success of the co-operative buying plan. But of that, more later.

Based on the instant success of co-operative, or community, or quantity-buying—whichever you choose to call it—men and women who had been benefited by this means of purchasing their necessities undertook to *sell* the production of their own hands and lands by reversing the method they had used in their *buying* organizations. This reversal, without a complete reorganization of their merchandizing methods, did not succeed. It is a matter of record that the first co-operative marketing attempts almost uniformly resulted in failure. When the producers learned that, in buying quantities of a number of commodities, the buyer virtually can dictate prices, but that in selling quantities of one commodity it is the buyer, not the seller, who makes the price, the co-operative associations began to function.

With a few notable exceptions—such as the milk and cheese associations in Wisconsin and other Middle West states, and the orange growers of Southern California, for example—co-operative marketing organizations today are successful only when their members are comparatively few, their production limited, their market close at hand, and their control and direction vested in men who know production, demand, market and salesmanship. Such men are hard to find; they have not been found by the Jewish promoters of the new American farm trust, which, thanks probably to the great distances of this vast country, is not quite a reality.

There are in the agricultural states from the Appalachians to the Rockies, approximately 10,000 local co-operative marketing associations. Most of them are successful in that they bring to the average producer about what his product is worth, and to the producer of below-the-average crops, more than he could obtain for them in any other manner. The farmer who knows his business as well as does the successful manufacturer, and whose product is better than average, does not, and will not, join these associations.

It is worth noting that these *local* associations, both in the interior of the United States and on the Pacific Coast, where they have reached greater development than in any other section, have moved along smoothly and profitably until the Jewish influence began to be felt in them. Then, almost immediately, dissension inside, and quarrels with the market outside, began to appear. The majority of the associations which have come under the new influence and are now solidly under Jewish control, are on the Pacific Coast, the larger number of them being in California. The stories of some of them, which will be told in these articles, are pitiful; of others, when one notes the manner in which these white, free, American men have allowed the Oriental financiers to pull the wool over their eyes, one is tempted to say, "it serves them right."

The local co-operative marketing association, however, is merely a small stepping-stone to the promoters of the new control of all American farm products. So far as the writer has been able to observe, the original *local* associations are good things for the farmers. Owned and operated by men who are or have been close to the soil, it would be difficult for an outsider to obtain stock in one of them, and almost impossible for him to put himself in a directing position in one. But dissension is ever the torpedo of the Jewish submarine in America. So today there are working among these local associations in California men whose business it is to make the co-operatives dissatisfied and to implant the idea that the manager of the association needs to know nothing of farm production or of the things produced, so long as he is a "salesman."

When such dissension has been accomplished, there is always ready the hand-picked man to handle the job, bring the quarreling members together, reorganize the association, plunge it into debt if it is not already there, draw it into the national web of associations, and then turn it over, signed, sealed and delivered, to the higher Jewish control. This has been done a dozen times among the deciduous fruit growers of California. It is today being attempted among the potato growers of the entire nation. It was done with the tobacco growers of Kentucky, and the cotton growers of the southern states. It would require a volume the size of the dictionary to tell even briefly the schemes that have been used to disrupt, reorganize, re-finance with various methods of financing, and then hold helpless these local associations of producers of virtually every crop that comes from the soil in the United States. Now a similar invasion of Canada has been commenced.

The local association being so made ready for further operations by these doctors of farm finance, a number of locals handling the same or kindred products are organized into a county, state, or regional association. Into each local is injected a manager, usually a Gentile, but always a man who is bound by some heavy cable to the promoters of the national organization. It is the business of one of the promoters to keep these cables taut, and how he does this will be told in a later chapter.

To these managers are added assistant managers, office managers, sales managers, transportation managers, advertising managers, publicity directors, field agents, and every other form of business office holder to whom a title and a desk can be fitted. Not all of these are applied to one local association; for the promoters know to a German mark just how much the traffic will bear. But—never forget this—the farmer pays the bill. One of the promoters occupies the responsible and fully remunerative position of legal adviser to *every* association, *local* as well as *regional.*

A glimpse at the beautiful Santa Clara Valley, where the most elaborate trial of the Sapiro Plan has been staged, with disastrous results to the prune and apricot growers. These California fruit-growers would like to cast off the Jewish millstone they have tied around their own necks, but they dare not.

The citrus fruit growers of California, whose co-operative marketing association is conducted on a plan entirely different from that of the Sapiros, have been successful, largely because the area in which oranges, lemons, grapefruit and tangerines will produce is limited, but they too are approaching the saturation point in demand for their output. Here is a view in the Redlands, California,orange district.

Cattlemen of the West last year reorganized their association, partially on the Sapiro Plan, with Jewish agents hovering around the new project, seeking to get control of it. The Sapiro Plan will get 'em, if they don't watch out.

With the local associations—which, during the reorganization, re-financing, re-officering process, have been changed from "locals" to "branches"—the formation of the county, state or regional association goes on. Here are provided elaborate headquarters, at high rent, and here, at high salaries, are placed the same kind of "officials" provided for the locals. Where the manager of the local association, prior to the introduction of the non-farming, non-producing agricultural expert, served for a salary commensurate with the value received for the products of his fellow-members of the association, the manager of the new association receives a salary proportionate to his ability to hold the regional association and its branches in line under the new plan.

The average minimum salary of the managers of these regional "co-operative" associations is $10,000 a year.

The maximum of which the writer has been able to find an authentic record is $50,000.

Obviously, the businesslike way to pay these managers would be by commission on the business they handle, and to eliminate the managers and other officials of the branches, who are about as unnecessary as a belt with suspenders. Incidentally, the sales manager of one of the largest regional associations in California was a woman, a stenographer, whose only claim to ability was that she was a friend of the manager. When this manager was ousted, in a fruitless attempt to break the Jewish grip on this association, the lady went with him. Before she went, a persistent lawyer compelled her to admit that she had received $5,000 from an eastern fruit-handling firm, but to save her life the poor lady could not remember what she had done to earn this sum. That five thousand dollars ultimately came out of the pockets of the members of this association.

Now then, we have carried the plan by which the American farmer is being "organized" to the point at which the regional association has bound together all its branches. A costly, cumbersome, usually inefficient, and always extravagant organization is functioning, not for the benefit of the farmer, but for the benefit of the promoters, for the lesser lights of Jewry who surround them, and for the Gentiles who, for money or for other reasons, have become the human camouflage for the operations of the originators of the new form of "co-operative marketing."

But the end is not yet. A huge advertising campaign, ranging in cost from $100,000 to $2,000,000 a year, is "voted" by directors, the majority of whom are chosen by the promoters of this great co-operative advancement for the farmers. The local associations in the old days sold all their production without advertising and at a price which returned a better profit than any they have received from the new branches under the regional associations. Yet here they are called on to add to their other burdens the payment of a tremendous and in the main unnecessary bill for advertising.

Who handles this advertising? Ask Mr. Lasker. Ask Mr. Honig, of the Honig-Cooper Company, San Francisco. They know. And maybe they could tell why *only certain publications bid for this advertising*, all the remaining publications of the United States being automatically barred from the orchard when this plum tree is shaken.

These advertising gentlemen are of the same nationality as the promoters of the new co-operation among the farmers of America.

So are the advertising managers of the majority of the magazines and newspapers which divide the advertising funds from these associations.

Both of the advertising companies which handle these funds have their Gentile "fronts," too, and, unless you are one of the two unlost tribes, you'll have a lot of trouble seeing either one of the principals in the firms, though you'll meet a lot of young American men in their offices.

Enters now, also, the Jewish canner and packer of fruits and vegetables. There is always a certain amount of second-class fruit and vegetables around the packing houses of these co-operative associations. Some of it isn't so second-class either, but if the canner be "in right" he gets it all for the price of the seconds. That's good business for everybody except the farmer. It keeps the favored canner at the door buying seconds; in fact, he is a so-ready market for fruit and vegetables which, *according to the new manager*, cannot be sold elsewhere. Then, too, when production goes above all ability of the market to absorb, *as it often does in the territory of these associations*, there's the opportunity to let Mr. Favorite Canner have the over-production, so he can sell it first at the top of the market, and then let the farmer wait until the public has consumed Mr. Canner's product.

This is not theory of what may happen; it is fact of what *has happened* in more than one instance.

If this strain of payment to Jewry for the permission to work ten or twelve hours a day on his farm or in his orchard, puts the farmer flat on his back financially, a group of banks stands ready to make any necessary loan—at the regular rate of interest. This loan (*be sure to understand this clearly, because it is important*) is not made to the farmer on his land, or on his reputation, or on his character, or on his note, but to the whole association. This means that every man or woman in that association, every member of every branch of that association, is responsible, and all his or her land is responsible, for the money so loaned. John Johnson may be able, being an intelligent, trained agriculturist, to make his farm pay, despite the incubus of the modern co-operative association, but that does not free John from having to pay Bill Smith's debts if Bill, being an incompetent, shiftless or lazy "co-operator," fails to pay the money he borrowed through the association.

Hoeing potatoes for Sapiro, who at present is at work to put every potato grower in the United States on the same job for him.

Just lay down this paper for a minute and figure out who gets the most money, in the easiest way, on these loans.

We now proceed to the next step in co-operative salvation for the American farmer.

When the county, state or regional associations have been formed, and are working to the full extent of the amount the farmer can pay, it is the plan of the promoters of the whole scheme to combine all these associations into one national association of each kind. That is to say, there will be one national association of peach growers, one of apple producers, one of cabbage farmers, another of wheat raisers, and so on down the list.

One must admit that there are some possibilities in this idea, when it is figured that, in addition to the fat jobs in the branches and the regional associations, all these offices must be duplicated in the national organizations as well. Incidentally each national association also will have to have a "legal adviser," just like the regional associations have. Now if this legal adviser took from one small regional association $51,000 for fees in one year, as he did, how much can he get from one national association? And if there are some twenty-five to thirty national associations, how much will he get from all of them? Only time and the perfect "co-operation" of the American farmer with his Jewish exploiters can answer.

The only one of these national organizations that is in process of being formed is that of the potato producers. From Maine to Washington and from Minnesota to Texas, the outriders of these self-appointed saviors of the American farmer are working with the potato growers of the nation. The tobacco growers of the upper South have been fairly well organized, and the area of this crop production is so well defined in the United States that their organization is virtually national in scope today. The cotton producers of the farther South are about eighty-five per cent organized in what amounts to a national organization. In California, where the larger part of the prunes and apricots of this country are grown, the producers of these fruits are collected into a regional association which is to all practical purposes national, though this association is today in such a chaotic condition that a considerable part of another chapter will be devoted to it.

Those able workers who can be spared from the potato fields are beginning to get out among the wheat growers, and with the aid of certain men of national reputation, such, for example, as Senator Borah, who possibly knows nothing of the real organization back of this movement, are making some headway in "lining up" the wheat farmers of the nation.

And the end is not yet. The writer has reason to know, from sources which are unimpeachable, that when the farmers of America have been organized into national associations, the men who control these associations will be united in one national organization. And the men who control this super-association, this Jew-directed holding company for all the farmers of America, *will not be the farmers of America.* The farmer or fruit grower or vegetable producer who is so unfortunate as to be in this endless chain of so-called co-operative marketing associations barely controls his own life. He has a weak voice in the tiny branch association to which he belongs, yet which is ruled by agents of the promoters of the scheme, and even his crop and his land is subject to loans of money to other men whom he may not even know. When his crop is delivered to the branch association, it is lost to him, as far as control or direction of selling is concerned.

The prices which the food producers of this nation receive through these new co-operative associations—bear in mind this article has nothing to do with the local associations which are functioning without Jewish "aid"—will be discussed later. But, while the tillers of the soil are thinking of their own personal incomes and expenses through such associations, it would be well for them also to consider the legal aspects of the regional associations, the national associations, and the national or international, as the case may be, holding company, for which, as I have said, definite plans have been laid. There is not a doubt in the mind of the writer, who has obtained the opinions of some of the best corporation attorneys in this country, that not only the proposed national holding company, but the national associations, and even some of the state or regional associations, are operating in direct violation of the laws of this nation and of several of the states.

In fact, in California, where the proponent of this whole idea was started on his way by a state official, it was found necessary to change certain state laws so that these associations could function beyond the local or branch stage. Even with all this clever aid, put through the legislature by Jewish attorneys, the superior court of Santa Clara County, no later than last winter, declared void the amendment to the state civil code which gives co-operative marketing associations the right to enforce crop contracts with their members. The court held the amendment to be class legislation and, therefore, a violation of the constitution of the state. This is merely the first warning that these associations are monopolies, and that their members are as amenable to the law governing attempts at the restraint of trade, coercion and similar offenses, as are other organizations. Nor is this all.

The lure held out to the farmers to induce them to surrender their freedom of production, distribution and sale to these new associations is that the producer can fix the price of his product, meanwhile maintaining the demand, or market, for it. There are other attractive baits offered to the farmers by these promoters, but this, though economically unsound, is the first and apparently the most influential. The very attempt to put the farmers—provided the farmers were allowed to control their own output—in a position to do this price-fixing and to maintain the demand for their production, would make of the association a monopoly. This constitutes a very real and dangerous menace, a monopolistic trap, baited with co-operation, for the farmer.

In a succeeding paper, Mr. Morgan will tell of the birth of the plan to organize the farmers of this nation in the new co-operative scheme whose details are outlined above, and of how a state government was utilized to give the project its start in life.

"On the Eighteenth of April in Seventy-five;"—

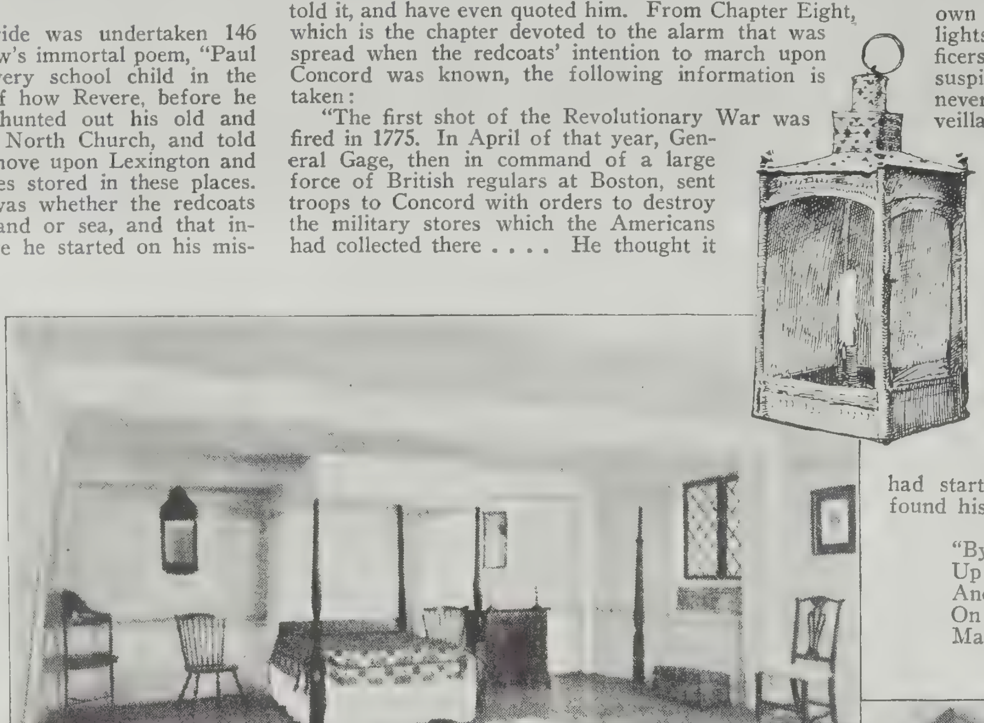
Obscure Patriots Play Important Part in Historic Incident

By MRS. L. M. CRAMER

EACH year on the night of April 18, Boston celebrates. Lanterns are hung in the steeple of the Old North Church, just as on that memorable April night in 1775 when Paul Revere rode away into the darkness to warn the militia and the minutemen that the British were about to march upon them. That was the eve of the day on which a shot was fired that was "heard round the world."

Though that memorable ride was undertaken 146 years ago, thanks to Longfellow's immortal poem, "Paul Revere's Ride," practically every school child in the land knows the story well: of how Revere, before he left Boston on his mission, hunted out his old and trusted friend, the sexton of North Church, and told him that the British were to move upon Lexington and Concord, to secure the supplies stored in these places. What Revere did not know was whether the redcoats planned to leave Boston by land or sea, and that information he must have before he started on his mission. According to Longfellow's poem:

"If the British march
By land or sea from the town tonight,
Hang a lantern aloft in the belfry arch
Of the North Church tower as a signal light,—
One, if by land, and two, if by sea;
And I on the opposite shore will be,
Ready to ride and spread the alarm
Through every Middlesex village and farm,
For the country folk to be up and to arm."



Above—Paul Revere's lantern. Below—Chamber, Paul Revere House.

Such is the story of those signal lights, as told by Longfellow in his famous poem. What the poet did not weave into his story was the fact that Revere was the second messenger sent out that night by the vigilant Joseph Warren, to spread the warning "through every Middlesex village and farm," nor did he tell that Revere never reached his destination of Concord, and that a third man delivered the message there. Both messengers sent from Boston, however, reached Lexington in time to warn John Hancock and Samuel Adams, who were sleeping that night at the home of the Reverend Jonas Clarke.

The first messenger sent out that night was William Dawes, Jr. On the back of his horse he swam the Charles River and was well on his way before Revere reached the farther shore of the Charles, whence he had been rowed by boat, and where a blooded horse waited, ready to be mounted when a flash of the signals gave him knowledge of the plans of the enemy.

It was Dr. Samuel Prescott who carried the news into Concord. Prescott was returning, shortly after midnight, from a call upon his sweetheart, a Miss Milliken, of Lexington, when he overtook the two messengers just leaving the village. They told him their errand, and he volunteered to help. The three set out for Concord, where the largest part of the supplies of the Colonial Army was stored. When nearly halfway there, they were surrounded by mounted British officers. Spurring their horses they tried to dash past, but were forced into a side pasture by the road. Prescott, jumping his horse over a low stone wall, escaped, and got safely to Concord where he gave the alarm. Dawes was chased for some distance, but made his escape, and reached Concord shortly after Prescott. Revere was allowed to return to Boston the following day and that was the day the first battle of the Revolution was fought.

It is the anniversary of this night that Boston has celebrated each year for nearly a hundred years. There is speechmaking and music, and a direct descendant of Paul Revere hangs the lanterns in the steeple of the Old North Church, and then gallops through the night over the route taken by Warren's messengers that April 18, 1775, even across the bridge into Concord.

It is always considerably more of a celebration of Longfellow's poem than it is an historical event. It is known as "Paul Revere Night." In this celebration William Dawes and Samuel Prescott are forgotten, just as the parts played in that night's history by Captains Pulling and Barnard, and Sexton Robert Newman are forgotten. None of these men are mentioned by Longfellow in his poem, and neither are they mentioned in some, at least, of the public school histories.

In Beard and Bagley's "History of the American People," used at this time perhaps more extensively than any other grade-school history of that period, the authors tell the interesting story of the night of April 18 in much the same language that Longfellow has told it, and have even quoted him. From Chapter Eight, which is the chapter devoted to the alarm that was spread when the redcoats' intention to march upon Concord was known, the following information is taken:

"The first shot of the Revolutionary War was fired in 1775. In April of that year, General Gage, then in command of a large force of British regulars at Boston, sent troops to Concord with orders to destroy the military stores which the Americans had collected there . . . . He thought it would be a simple matter, dispatched with great secrecy, but the patriots in Boston were alert and watchful. Lanterns hung out in tower of the Old North Church flashed far and wide the signal that the British were coming, and Paul Revere galloped along the road ahead of them, rousing the farmers!

"'So through the night rode Paul Revere;
And so through the night went his cry of alarm
To every Middlesex village and farm,—
A cry of defiance and not of fear,
A voice in the darkness, a knock at the door,
And a word that shall echo forevermore!'"

But not a word in that history about the other two men who helped to spread the alarm that night, nor a word about Sexton Robert Newman, nor of Captains Pulling and Barnard who secured the information which should guide Sexton Newman in the choice of his signal lights. It and some other school histories have builded for facts on a poem which does not stick very close to actual history.

Captain Tom Barnard and Captain John Pulling crept stealthily through the streets of Boston, listening wherever a group of redcoats gathered and conversed in low tones, eluding the eye of the Vigilance Committee cleverly, yet learning its secrets, and when they turned toward the church again, they knew the sexton would hang two lanterns in the belfry arch. "One, if by land, and two, if by sea." Revere had said, and then rowed across the river where a horse awaited him, to carry him away into the night on his mission of warning when the signal lights should flash from the church tower. Dawes had already gone on his way to Lexington, to warn Hancock and Adams. He was to wait there for Revere, and the further information which the signals would give Revere.

Sexton Newman was practically a prisoner in his own house, and he was intrusted to hang the signal lights. His was a modest domicile, but British officers were his unwelcome guests, and he was under suspicion, watched as a cat would watch a mouse, never free for a waking moment from their surveillance. That night he feigned illness and went early to bed. And so, while Paul Revere stamped impatiently beside his restive horse on the Charleston shore, Newman turned and tossed in his bed, till the house grew still and his guests slept. Then he rose, dressed and climbed out of a rear chamber window, down a sloping roof to the ground where Captain Pulling awaited him with instructions to hang two lanterns, and Captain Barnard kept watch to give the alarm if danger approached.

Newman entered the church and Captain Pulling locked him in, and then the two captains crept away into the shadow of the night.

It was cold and dark and a drizzling rain had started to fall. Newman, groping in the dark, found his lanterns, and went

"By the wooden stairs, with stealthy tread,
Up to the belfry-chamber overhead,
And startled the pigeons from their perch
On the sombre rafters, that round him made
Masses of moving shape and shade,—
By the trembling ladder, steep and tall,
To the highest window in the wall."

Paul Revere House, Boston, Massachusetts.

One who has climbed the steep, squeaky, winding stairs of that old church to where the signal lights were hung can feel with Newman "The spell of the place and the hour, and the secret dread of the lonely belfry and the dead"; and they possibly can realize that Newman that night was fully as heroic a figure as was that other figure, waiting impatiently on the opposite shore to mount his horse and be away.

Newman hung his lanterns and got back into his home. Some one was moving about; his guests were restless. Quickly he undressed, flung his wet clothing in a heap on the floor, and got into bed. A quick-witted wife grabbed the wet clothes and his shoes, and hid them in a closet, substituting dry ones just as the British officers, growing suspicious of sounds in the house, and discovering lights in the church tower, broke into his room and took him prisoner. Thanks to his wife's thoughtfulness he was quickly given his release. They had no way to prove that he had left the house that evening, as his clothes were dry and the night was rainy.

Long afterward—a hundred and three years after, to be exact—a tablet was placed in Old North Church, which read:

"The Signal Lanterns of
PAUL REVERE
Displayed in the steeple of this church
April 18, 1775
Warned the Country of the March
Of British Troops to
Lexington and Concord."

But no mention is made on that tablet of Newton who hung the lanterns or of William Dawes who, disguised as a farmer, had put the spurs to his horse two full hours before Revere started, going to the more out-of-the-way places to awaken the minutemen, and arouse them to action. Dawes had gone over Boston Neck. Both Dawes and Revere reached Lexington, and warned Hancock and Adams, Dawes arriving there but a few minutes ahead of Revere. The two then started for Concord, and were joined on their way by Prescott. Halfway between Lexington and Concord they encountered a body of British horsemen. Prescott's horse leaped a stone wall and he escaped and got to

(Concluded on page 14)

Should U. S. Capitol Be More Centrally Located?

Climate of Washington Bad for President and Congress; No Stimulating Weather; American Capital Compared With Ottawa

WHY don't we have the wisdom and courage to think continentally, as Alexander Hamilton put it, and locate the national capital near the geographical and population centers of the Republic where the climate would enable presidents to stand the strain of their tasks?

It is possible that Wilson would still be in good health and Harding might be alive if the Washington climate was even equal to that of Princeton and Marion.

The combination at Washington of humid sultriness and monotony of weather, the two greatest foes of human efficiency, neutralizes the vitality of Congressmen and officials to an extent that mystifies those of their constituents who are not familiar with the debilitating city on the Potomac.

Calcutta, the low, hot capital of India on the banks of the Hooghly, is being abandoned for Delhi in the Punjab, a thousand miles to the northwest. However, the Indian government for generations has been sensible enough to remove to Simla, also in the cool Punjab hills, from May to October. Our Philippine government also has a summer capital in the highlands. In fact the United States is the only important country that does not provide at least a summer residence for its executive.

Petrograd, which, like Washington, was established on a vacant swamp by decree, has been given up for central logical Moscow. Petrograd's climate was also monotonous and its cold was as bad in its way as the heat of Calcutta, Washington and Manila. Even the Soviets have recognized the necessity of the capital having a central location, and have moved to Moscow.

Location Is Unfit

STATESMEN such as Napoleon and Hamilton would not be less progressive or intelligent in such a matter than benighted India and Russia. Selected through submission to the blackmail of delegates who would not vote for the adoption of the Constitution unless they got the capital, the growth of the country since it was but thirteen seaboard states, has made Washington an altogether unfit location.

The isolation of Washington from the Middle West, the center of the country which determines its industrial, agricultural and political affairs, is bad for Congressmen, government officials and foreign countries.

Congressmen seem to be overwhelmed by the atmosphere of the Europe of America, as one of Washington's leading merchants recently termed the northern seaboard states.

Henry Watterson once declared there was something about the air or the whisky of Washington that speedily caused Congressmen to lose contact with their constituents to such an extent that other men were soon elected to fill their shoes. Climate and geography are the major causes of these blighted Congressional careers. Whisky, this time, was less harmful than the other two evils.

The related point is that diplomats, journalists and other creators of foreign public opinion who visit America usually limit their itineraries to Washington and the European cities and watering places of the North Atlantic seaboard. They give their countrymen a distorted or unreal picture of America that often has distressing results.

The high, rolling hill country of Southern Indiana, the center of population of the United States, has much to commend it as the site for a new capital. Several of the best known all-year resort hotels in the country are at French Lick and West Baden. Many public men and other leaders use these places for recuperation. This favored region has mild winters and summers. The weather is of the changeable sort necessary for stimulation. Mere balminess palls on people and makes them sluggish. This central location is ideal for radio and airplane communication. It is reached by several important east and west and north and south railroads and is near the National Pike and other touring roads.

Reckoned in figures of present-day budgets and our loans to foreign government, the removal to a new capital would not be costly. The gain in the efficiency of the government and in convenience to all the people would quickly wipe out the expense. The move would also cause the deferred reorganization of the government departments, a crying need, to be made. The public would demand that the new buildings and transplanted organization be arranged to produce results without the present waste of effort and money.

The Canadians may regard New York and our population and stupendous national wealth and sigh, but they can have the satisfaction of possessing a Federal capital whose setting and climate are incomparably superior to Washington. They also make contact with their government offices under happier conditions.

We have in Ontario province, the location of Ottawa, and in the British Bahama Islands a vivid illustration of the effect of climate on people. Both were settled by American Tories or Loyalists who preferred to live under the Crown after the Revolution. The enterprise and capacity for creative work of the Ontarians make them conspicuous among the worth-while people of the world. The Bahamans are notoriously lazy and good for nothing. They smilingly admit it and say their critics would soon be like them if they removed to the island. One hundred and fifty years ago they and the Ontarians were the same!

Last summer the United States was mortified to learn that thirteen guides had the exclusive privilege, in return for a fee which they pocketed, of escorting visitors through the imposing Senate wing of the Capitol at Washington.

Citizens who believe the Capitol is free are disabused when these backsheesh grabbers hold them up. A girl from the Middle West who was found in tears because she didn't have the money for the service she thought was free brought the condition into prominence. Everyone connected with the Capitol now professes to be ashamed of this feature of the patronage perquisites of Senator Sorghum and his quaint colleagues.

In Ottawa the visitor is escorted through the stately new parliament building by an intelligent, well-bred official whose attire includes the metal-buttoned frock coat and boiled shirt of British functionaries. He greets you with courtesy and takes leave with an expression of pleasure at your interest, maintaining his self-respect by declining a fee.

The guards at the Washington buildings are mediocre without the personalities and appearance that should mark them. They are evidently some more patronage from the Congressional plum tree.

Members of the world-famous Royal Canadian Mounted Police keep watch and ward at the Ottawa public buildings. These alert young men evidence the pride and tradition of their service.

The R. C. M. P. seem delighted to put their fund of information about Canada and her government and Ottawa and the buildings at the disposal of visitors. The average Washington guard is abysmally ignorant of anything save the building in which he is stationed. Of course, the climate has much to do with their listlessness and futility.

The first government building encountered in Ottawa is the general post office with its prominent signs announcing that it operates a general information office for persons seeking the federal government.

Washington certainly needs such an information office. The person unacquainted with circumlocution offices is left to his devices there. One must have a call upon a Congressman's office, an attorney or one of the many concerns and associations that sell government information and service that should be easily available to the public without using such middlemen.

Compared With Canada's Capital

THE government offices seem so used to responding to Congressmen and the associations and concerns that sell their services, and have the ability to impress themselves upon the departments, that the citizen playing a lone hand frequently has a desultory time of it.

"Practicing before the departments" is the high-sounding title of the profitable business of certain lawyers and ex-Congressmen, especially those who have entrée to the high official and diplomatic social affairs. It is one of the most profitable secondary pursuits in the country and a pernicious influence. "Bootlegging government dope, obtained through knowing how to get it out of the warehouse," is what the vulgar would term it and they would be about right at that. A properly organized departmental system would eliminate most of these parasites.

Ottawa with her majestic location upon the one hundred and fifty foot limestone cliffs above the Ottawa rapids, her cool summers and crisp winters and frequent variations in the weather that arouse people to effort, has been a fortunate choice for the capital of the Dominion.

Canada's capital is midway between the maritime and prairie provinces and on the transcontinental railroad lines. Montreal, the New York of Canada, is but three hours' distant and it is seven hours to Toronto, a so-called Boston. The Ottawa River is the boundary of Quebec and Ontario, the old Upper Canada.

There are few places that give one the thrilling views obtained from the Chateau Laurier, Major's Hill Park, which extends from the hotel to Nepean Point, the edge of the cliffs that overlook the river, or Parliament Hill.

Between the terrace of the hotel, on which meals are served in the summer, and the slightly higher Parliament Hill is the deep grassy cut, seemingly a natural gorge, made for the eight locks of the Rideau Canal. From the terrace of the hotel, and from many of its rooms, as well as the walks in Major's Hill Park, one can observe the locking of vessels up and down the hydraulic stairway, and the splashing of the surplus waters through the idle locks sounds like a rapids. The placid Rideau River which feeds the canal flows through fair fat Ontario to Ottawa. However, the Chaudiére Falls of the Ottawa and the savage Gatineau which it meets here impel it likewise to make a plunge over the Rideau Falls.

The Rideau Canal is 126 miles long. It connects the Ottawa River with Lake Ontario at Kingston. Its forty-seven locks have a total lift of 458 feet. The Duke of Wellington authorized the canal which was finished in 1827. It was built to provide a military route from Montreal to the Great Lakes that would avoid the New York State bank of the St. Lawrence River. Two and a half million dollars were spent on it while England was also taxing herself for the Napoleonic Wars, just ended.

Scenic Setting Lacking

LOOKING across the Ottawa rapids one sees the junction with the Gatineau River which rushes down a couple of hundred miles from the Laurentians' crests, the height of land between Hudson's Bay and the St. Lawrence, over more rapids, cascades and falls than any other river in Quebec.

The Gatineau Hills have long been famous among sportsmen and now their Adirondack-like scenery is making them an international vacation land. A railroad and a connection with the Ontario good road system crosses the Alexandra bridge at Ottawa and penetrates the hills, which are in Quebec.

Far away in the sunset is the hazy outline of the Laurentian Mountains, the crest of the Canadian shield, which extends to the prairie provinces, the shores of Hudson's Bay and the Labrador coast.

One obtains a glimpse and a sensation of empire from these vantage points in the capital of the Land of the Maple Leaf.

The railway and interurban terminals and the Chauteau Laurier hotel, the latter a noble structure of the style of Francois I, have been combined in a fashion that must delight the city planner. They minister to one's travel requirements so much better than the same Washington facilities. The train sheds and entrances are arranged so that smoke is never seen. One walks from the fine station concourse through a marble corridor to the elevator or single flight of stairs to the lobby of the Chateau Laurier. It is but a block from all the hotels to Parliament Hill.

If Washington only had a Chauteau Laurier! It has no hotel that compares with it in architecture and location. In Washington the best hotels are a mile from the station and the Capitol. Since, as a usual thing, the coastal rains are either deluging the streets or the sun is softening the asphalt, the street car ride is long and the distance makes taxicabs expensive.

While a few Washington hotels give one a glimpse of a government building, most of their guests merely look out on city streets. There is an absence of the magnificent group picture of capitol, parks, rivers, rapids and mountains that is enjoyed by the guest at Chauteau Laurier. Incidentally prices at Washington hotels are higher than at good New York hotels whose food and service are superior.

On a few spring and autumn days Washington with its great wide streets, parked spaces and masses of white government buildings seems fine indeed. The splendor of the Capitol dome when illuminated by flood lights is matchless. The giant shaft of the Washington Monument dominates the scene. Unfortunately the White House is on the low river bottom where it is hottest in summer. Dives and his kind live out on the heights when in the city during the summer. Most of them are in the mountain and seashore resorts while the President is sweltering at his desk. This is unfair.

Changing the location of the capital would be opposed by financial and other executives who like to spend the day in Washington and take the afternoon Congressional Limited to New York. The idle rich who have built Washington palaces for social campaigns and the parasites who have entrenched themselves in departmental and Congressional lobbying would be up in arms if a move were seriously considered.

A Fifty-Fifty Solution

IN ORDERING 7,000 Negroes to leave his city, the mayor of Johnstown, Pennsylvania, acknowledged defeat in coping with the Negro problem, a pressing riddle that is forcing an issue in practically every city of the country at this time.

In marked contrast with the failure at Johnstown, it is reassuring to learn that Winston-Salem, North Carolina, has reached a happy and workable solution, the details of which are admirably set forth in *Collier's* for March 29.

Of Winston-Salem's population of approximately fifty thousand, nearly twenty-five thousand are Negroes. For its important industries—it boasts the largest knit-goods mills and the third largest furniture manufactory in the United States—Winston-Salem depends for labor upon Negroes.

As in most places, it was conceded that the Negro was all right in his place, but no one in authority concerned himself with helping him find a place, until James G. Hanes was elected mayor, about two years ago.

At that time, trouble was threatening. The Negro was leaving the old, wretched quarters, among railroad tracks, factories and warehouses, and procuring better, more modern and sanitary homes in the white section of the city. This meant, of course, among other things, that Negro children began to appear in hitherto exclusively White schools.

Mr. Hanes, with sure insight, realized that the city was to blame for the situation. The White sections alone were made desirable residence places. In the Negro sections the streets were neglected, often unpaved, and there was no provision for water, sewerage or lights, nor were there adequate schools, police and fire protection, sanitation or health work.

Under the guidance of Mr. Hanes, the Negro was provided with equal municipal advantages with the Whites. The result has been that, of his own accord, the Negro has moved back among his own people.

In addition to new schools and playgrounds, with Negro directors and musical instructors, musical instruments have been bought for the Negro community, and bring happiness and instructive recreation into the lives of the children. Furthermore, in the half-million-dollar municipal hospital, there are two wings, of the same construction and identical equipment. One wing is for Negroes; the other for Whites. The annual appropriation for health work is split fifty-fifty between Whites and Negroes. Finally, there is a strong Inter-Racial Relations Committee to which any colored citizen or group of colored citizens can carry any grievance or problem, assured of receiving a sympathetic hearing.

Amid the surging, boiling national difficulties, such peaceful solutions seem to appear on the horizon as a guiding star, pointing toward a sane, logical solution of perplexing problems.

Giving the People Their Choice

THERE is much of humbug in American politics. The caucus and convention system of nomination has been superseded in the main by a plan of primaries. The merits of the old and new systems, either of which is good in theory, are not to be discussed here. But it is true that defects of the one are not absent in the other; in fact, that only the vigilance of the citizen, the honest patriotism which should inspire him is the only means of keeping primaries and elections honest. Instance after instance might be related of the many schemes undertaken by the professional politician to fool the voters, but a few will suffice.

The caucus and convention system, in the beginning, was ideal in its methods, and worked well, for it was based on the theory of representative democracy. The smallest political unit in mass convention selected delegates to represent it at the next higher unit's convention, specifying a line of conduct or not, as it wished, but usually leaving them free to exercise individual judgment.

In the succession of years there was developed a distinct class, the professional politician, and he soon made the control of party conventions an art. Demand for reform followed, and the secret primary, and later the preferential primary, were adopted to give the individual voter a chance.

That President Harding received his nomination in 1920 was due to other causes than a popular expression of preference is an absolute fact. Johnson carried more votes in the preferential primary than other candidates for preferment, but the delegates for the national convention were not picked from Johnson men, and only gave him a complimentary support at first, then joined in the jockeying for position to be recognized as an influence in the final result.

Without regard to the merits of the contest, it may be said that the result in the Democratic convention in 1908 was reached by a feeling that no one but Bryan could unite the party after the Parker disaster in 1904. Those who saw the rush of delegates could not but note at the head of the procession, shouting for him, a delegation chosen to oppose him. The nomination of Wilson was accomplished by intrigue.

The attempt to confuse the voters in Michigan in this year's primaries, by filing a petition for a local "Hiram Johnson" is but another example of the varied "humor" of the avowed politician. He was joking, he says, but not until after the name was ruled off the primary ballot.

Coming down to petty politics, an incident of a ward primary in March of this year is amusing. In a Republican ward in a certain city a Democrat had been elected to the council for three successive years. The defeated candidate had no difficulty in securing nomination, but election seemed impossible. The reason given is that, while strong with the women, he is not a "mixer." The committee had a candidate, but no hope of winning with him in the primary. The committee's choice was not entered in the primary, but a popular young man named to oppose the one who had lost three times at the polls and succeeded in winning the nomination. According to the prearranged program, he withdrew next day, and the committee named their real choice.

If the facts were generally known, it might prove a blunder, after all. The recital is given only to demonstrate that the ward "boss" is still master of the situation.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of The Dearborn Independent, The Ford International Weekly, published weekly at Dearborn, Michigan, for April 1, 1924, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of The Dearborn Independent, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware, Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

[Seal] J. EMMET HALL.

Sworn to and subscribed before me this 25th day of March, 1924.

(My Commission expires September 29, 1924.)

Sir Adam Beck Starts Action

THE recent appointment of the St. Lawrence Commission by President Coolidge will hasten the consummation of the project to deepen the St. Lawrence waterway and utilize the tremendous hydroelectric resources of its rapids.

It is significant that Tammany Hall, which opposed DeWitt Clinton in building the original Erie Canal, the basis for New York's supremacy as a port, has also viciously fought the St. Lawrence waterway. This lends color to the belief that Tammany has replaced its old liquor alliance with a more profitable one with Wall Street.

With Washington turning to favor the project because the Middle West would no longer brook delay, it has remained for Sir Adam Beck, the virile, aggressive head of the Ontario Hydroelectric Commission to prod the Canadian Government to action.

Ontario has but two main sources of power, the Niagara and the St. Lawrence rivers; there are no coal measures in Central Canada. It is estimated that within three or four years the province will have exhausted every hydroelectric resource except the St. Lawrence rapids whose damming would at the same time deepen the river for ocean steamship navigation up to the Great Lakes.

On the other hand Quebec province has a great number of fine sources of water power, numerous large rivers plunging down from the Laurentian Mountains to the St. Lawrence. A band of New York and Montreal bankers with admittedly powerful political allies in Ottawa are exploiting these Quebec powers, issuing securities on a basis of selling the current for all the traffic can bear.

The utilization of the millions of horse power available at the St. Lawrence rapids will enable current to be transmitted to New England, New York state and city and Montreal as well as to supplement the Ontario supply. This would invade the preserves of the international stock jobbers who are in control of the vast Quebec province powers. Just recently a Quebec power company announced it was going to transmit power to New York City.

The Quebec province politicians have often held the balance of power in Ottawa and this has enabled them to serve well their notoriously close friends in the power trust. However, Sir Adam Beck has never permitted peanut politicians to defeat the public welfare. The recent move of the Canadian Government to co-operate with the United States means Sir Adam has brushed aside another group of lobbyists.

The Real Issue

ONE of the strongest editorial comments on the issue involved in the political scandals under investigation in Washington is to be found in the *Christian Century*, an undenominational religious paper published at Chicago, in its issue of March 27.

That corruption be exposed and crime punished is a desideratum, of course, but, sated with the flood of sensational headlines, the danger is that the public may become dulled to the greater danger, that the morality of political life be permanently destroyed. As the *Christian Century* says:

"Neither Teapot Dome nor Fall nor any of the witnesses comprise, in themselves, the fundamental issue at stake. That fundamental issue is the present standard of public morality on the part of governmental servants of the American people. It is a vast deal more important to find out how our men in official life today interpret the dictum that 'public office is a public trust' than it is not to send Fall or Doheny or anybody else to jail. Testimony that may not be relevant in putting somebody behind the bars may be—and has been—exceedingly relevant in showing the standards of life in some parts of Washington."

That is enough to show the tenor of the editorial. It is a summary that should be studied by every lover of his country. It suggests the patriotic duty of all Americans. The issue is not political; it should not be made political. Starting backfires against political foes cannot excuse the betrayal of trust among those who thus have injured the party disgraced. As a political policy partisanship now is folly. Leaders who palliate the offenses are as bad as the men who commit them, and even if controlled by mere policy and not by honest indignation the party management which cleans the ranks of the offenders will do most to save the party itself.

"He serves his party best who serves his country best" is as true today as in more decent times. The blind followers of mere prejudiced vision will never save the nation from decay and disaster.

War-Torn Europe Prepares for Next Conflict

The War That Was Fought to End War Has Failed in Its Purpose;

All Europe Is Today an Armed Camp Awaiting Another Sarajevo

By SAMUEL CROWTHER

WILL there be another war in Europe? Six months ago, before I left for abroad, not having seen Europe since 1918-19, just after the Armistice, I should have answered:

"Not in our time, certainly. The people are tired of war. There is no more money for war. Most of the workmen refuse to make munitions. All they want is a chance to get back to at least where they were in 1914 before the war started. Everybody is sick of war."

Now, after five months spent in visiting all the countries of Europe except Russia, the Scandinavian countries, and the Spanish peninsula, talking with politicians, industrialists, labor leaders, and the man in the street, the question is not "Will there be another war?" The question is "When and where will the next war start?"

For unless some readjustments of a really drastic nature take place, a war which will involve most of the countries of Europe is inevitable.

Real and Fancied Grievances

I WENT abroad expecting to study economic conditions. I thought, from reading the reports, that the peoples of Europe would be by this time putting their houses in order. I found that there were practically no economic conditions to study—that instead there were merely economic phenomena, and that, with the exception of Italy, every country was in a basically worse condition than just after the war ended. It is true that there has been a reconstruction of the devastated areas of France and Italy, but the chief interest of a majority of the people everywhere, except England, is in settling some real or fancied grievance with some other country, or in getting ready to resist some real or fancied danger of an attack by some other country or countries.

The ordinary, plain people who have to fight in wars have nowhere in Europe a margin over their daily bread. Probably half of them have less than their daily bread. Looking at things from the American standpoint we should say: "Go to work and earn your bread," but it is extremely doubtful whether, under existing conditions in Europe, a man can earn his daily bread. The map of the Continent was redrawn under the Versailles Treaty and new countries were set up, based on old nationalities. Each country which received territory thought it got less than its due; each country which lost territory claims that it lost an integral part of its population. For instance, the German-Austrians are very restive in Czecho-Slovakia; the old Imperial Germans intensely dislike Polish rule; the Hungarians in Transylvania insist they will not tolerate Rumanian rule; the Croats are ready to revolt in Jugo-Slavia; there are Bulgarians and Greeks and Italians also in Jugo-Slavia; there are Bulgarians in Greece; there are Greeks in Turkey and Turks in Greece. The French-German situation is on a somewhat different basis. The peoples of Alsace and Lorraine do not care much whether they are under French or German rule, but there are efforts from within to set up Bavaria as a separate monarchy, and efforts from without to force a Rhineland republic.

More Armed Men Than in 1914

IN EVERY case the disturbances in these populations are enough to take the edge off work because professional agitators keep the questions ever alive. Somebody is always starting a riot. Riots are so frequent in all the districts I have mentioned, and one riot is so much like another, that they are not reported unless a real battle with the military takes place.

These countries are all afraid of their shadows. They are afraid of trouble from within and trouble from without. Most of them maintain enormous bureaucracies which seek to regulate everything, but actually simply mess up everything. They are afraid of too much goods being exported and they are afraid of too much goods being imported, so most of them have complicated regulations and tariffs which make business between countries all but impossible. For instance, it is cheaper for the Swiss to buy cattle from the Argentine than from Hungary, which has plenty of cattle to sell and needs the money, simply because the Hungarian export tax on cattle is so high as to put them out of the export market. Austria used to have a big textile industry. Now the weaving portion of that industry is in Czecho-Slovakia but the spinning of the yarn and most of the finishing and dyeing processes are still in Austria, and there is a great wall of tariff and custom regulations drawn right through the center of the industry.

Everywhere in Europe currency is not only depreciated but is flighty. The class which lived on investments has, of course, been wiped out. So also have all those people who lived by renting property, for nearly everywhere rents are fixed by law at the prewar rate. A property which formerly yielded enough for a family to live on now yields the price of a not very good cigar. These people are desperate. The working people for a while after the war, when they were in the saddle and currencies were being inflated, lived fairly well. Now prices have everywhere caught wages and the average workman of Europe is not only worse off than he was before the war, but in many countries is on the starvation line.

It is easy enough here in America, where we have plenty, to tell these people just what their troubles are and what caused them and how they could be remedied. But the actual facts have nothing to do with the case. In each and every country the ordinary run of people believe that all of their troubles are due to the machinations of some other country. The Continental peoples deal solely in illusions; they never face facts. They have no opportunity to face facts because they have no newspapers. In America and also in England we have newspapers which print news and put editorial opinions on the editorial page. On the Continent, newspapers do not print news. They are nearly all small sheets supported by political, industrial, or military interests and they print only that which will advance the interests of the owners. These conditions have brought about a situation which is almost incomprehensible, but which nevertheless actually exists. It may be summarized thus:

(1) There are today more men under arms in Europe than in 1914 and at least eight countries are on a war footing.

(2) There are more active causes for war and these causes are being more actively agitated than at any time within the past fifty years.

(3) Except in England, the dread of war does not exist. The people think war preferable to the way they are now living—for somehow soldiers get enough to eat.

Europe an Armed Camp

EUROPE today, needing useful production more than it ever did, is devoting its largest energy to the making of munitions and airplanes. The Creusot works in France and the famous Skoda works in Czecho-Slovakia, which is owned by the Creusot people, are engaged almost solely on munitions and locomotives. Whatever repairing of railways and rolling stock has taken place has been with a view to possible war. These two big factories, with their branches, have made the munitions for France, Czecho-Slovakia, Poland, Rumania, Jugo-Slavia and Turkey. The Vickers-Armstrong interests in England and Jugo-Slavia have made the munitions for Greece. Last year the Rumanian government fixed a price for its wheat crop, compelled all sales to be made to the government, and pledged the profit on the transaction to France for the purchase of airplanes. There are enormous stocks of munitions in every country except Germany, Austria, Hungary and Bulgaria. France has more airplanes than during the war. England has just launched on a big airplane program. Russia plans to increase its army to a million and a half men in 1924 and has a large, although probably fantastic, airplane program. Italy has plenty of airplanes. Poland is fairly well supplied. Jugo-Slavia, Greece, and Turkey have very few.

These people in Europe are thinking of war largely because they have precious little else to think about. They are hungry, they are desperate, and they are armed. The big war did not teach them the futility of war. They mostly think that the war stopped too soon and that they were juggled out of their rights by the peace. This applies equally to the victors and the vanquished.

And for most of them the war has not really stopped. Turkey set the example by going to war with Greece after the Peace Treaty. She lost in the Great War because she was on the side of Germany, but she won her private war with Greece and revised the peace terms. Italy got away with Fiume. France is in the Ruhr and along the Rhine and in addition to her plans for reparations and security has some grandiose plans for the domination of Europe. Only the fall of the franc altered those plans and paved the way for a possible settlement through the Dawes Commission.

It is the opinion of a number of men I talked with, who knew the Russian situation thoroughly, that unless the Red Army is occupied with a foreign war it may turn into a Pretorian Guard and set up a military dictatorship in Russia.

All Countries Suspicious

AS A matter of plain fact, England and America are the only countries engaged in the war who have tried to get on a peace basis and many men in England believe that it was a great mistake so quickly to demobilize the English army. For England without an army wields on the Continent nothing like the influence she would have with an army. But even though demobilized on land, England has had until lately about twenty thousand troops in Constantinople and at the Dardanelles, in addition to a big fleet scattered about the Sea of Marmora, while France and Italy had about five thousand troops each in Turkey, the French troops being mostly in Thrace and Constantinople. The Italians are largely in Constantinople. Both of these countries also have fleets in the neighborhood. We ourselves had a destroyer fleet with about twelve hundred sailors in the Bosphorus. Under the terms of the newest Turkish treaty, Constantinople has been evacuated by the foreign troops, but when I was there it was an armed camp, with the Allies watching each other more suspiciously than they watched the Turks.

The French army has only partially been demobilized, and the approximately nine hundred thousand troops in service are on practically a war footing. It is hard to get at the real number. The French troops in Germany, of course, are on an actual war footing, as is also that portion of the Belgian army which is in Germany. I found it very difficult to get at the actual strength of the Italian army, because in addition to the regular army there is a big force of *carabinieri*, who are picked troops acting as policemen, while the Fascisti militia is a strong force made up of men and officers who fought in the late war. Probably Italy has half a million men actually under arms. Jugo-Slavia has three hundred thousand men in service and they are fine soldiers. Their chief lack is officers, and these are being supplied by France. Rumania has officially about half a million men, but it is not much of an army and French officers are trying to whip it into shape.

Revolutions and Dictatorships the Rule

POLAND has also more than half a million men and this army also is being French instructed. Czecho-Slovakia has an army somewhere between one hundred and two hundred thousand. I found it impossible to discover the real number through any official source. It also is under French tuition. The Russian army is now largely commanded by ex-German officers, and all the pow-wowing about orders, the committee representation, and the Communist stuff which marked its beginning has been cut out. Greece is on a war basis but the size of the army is indeterminate. The command is so lax that it is hard to say who is in and who is out of the army at any one moment. A large force, however, is being maintained in Thrace. The Turkish army, and here again I found it hard to get at exact figures, will probably run to two hundred thousand, with as many more men available in case of war and with plenty of equipment and munitions. Germany has no army and it would be very difficult to raise one except in conjunction with Russia, simply because Germany no longer has any army equipment. The same is true of Austria and Hungary. Bulgaria cannot maintain an army under the Peace Treaty. She has plenty of officers, all German trained, plenty of men accustomed to war, but no munitions.

These armies exist because the single argument which has any weight in Europe today is force. This shows not only in the international relations but also in the domestic relations. Nearly every country has since the Armistice had some kind of a revolution in which force replaced the ballot box; Germany has had one revolution and will probably have another, Hungary had a Red revolution and it was put down by a White revolution, Austria went through almost the same course, Bulgaria has had two forcible seizures of power, Turkey had the revolution which brought Kemal to the front, Italy had the overturning which brought up Mussolini, and now Spain has come into line with a military dictatorship.

No Interest in World Court

ALL the ordinary considerations that usually influence public affairs have been thrust aside and force is in the saddle. What interest I found in the League of Nations was a financial one; Austria got a big loan through the League. The small countries of Europe who are in the League stay solely in the hope of being able to borrow money. They do not pay their share of the expenses and they have no intention of so doing. They are not interested in a World Court. They are not interested in justice unless justice be defined as giving them whatever they want. As a Russian Prince, who for many years was in the Imperial service and who is now the confidant of many governments, said to me in London:

"The mistake you Americans make in European affairs is in believing that anyone wants justice and fair play. I have never found that the question of right and wrong entered into any European situation. The one question is what you can get and keep. What you can take is yours. What you can't take you give to the other fellow and pretend you are compromising."

My own investigations entirely bear out the Prince's remark.

The next war will not be between France and Germany. Germany cannot make war; it can only have a revolution. But how could any war be financed? There is not enough money for peace but there is everywhere enough money for war; it would not cost much more to make war than it does now to maintain the armies.

The horrors of war? Part of war is getting killed—but still one has to die sometime anyway. And part of war, so the man who does the fighting reasons, is sitting about doing nothing and getting three square meals a day for it—and three square meals a day are just now at a premium.

"Alphabet Four," Forerunner of Present Navy

Famous "White Squadron" Worked Radical Change in Battleship Design

By HARRY H. DUNN

IN A shallow, protected little cove in a small island on San Francisco Bay, tied fore and aft to a sea wall with permanent moorings, lies the last ship of the "Alphabet Four" of the "White Squadron," once the most famous fleet of fighting ships in the world. Nearly forty years old, her guns dismantled, her engines removed, her boilers used to heat water for the thousand or more sailor-recruits on the island, the *Boston,* steel steam corvette, heroine of the battle of Manila Bay, and grandmother of our present war fleets, lies in her last port, from which she never can move under her own power, and from which she will be towed, only to be broken up for junk. Her sister ships, the *Atlanta, Chicago* and *Dolphin* have left the Navy forever, to be torn to pieces for the metal that is in them.

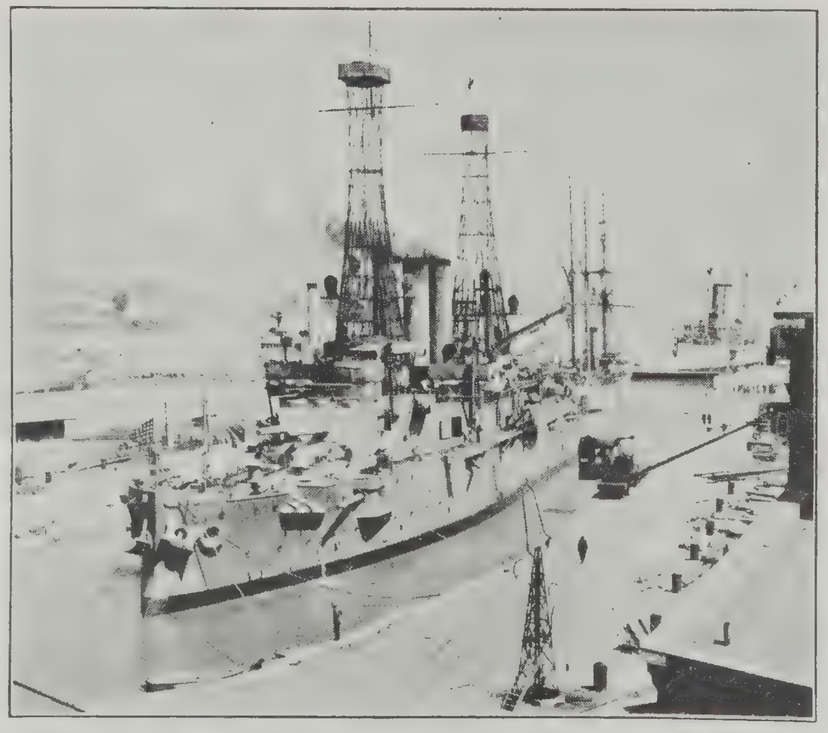
If that metal could speak, it could a tale unfold of more than a quarter of a century of sea service. The "White Squadron" which revolutionized the world's ideas of naval construction, and made the Stars and Stripes familiar colors in many a port the world around, laid the foundation for our present Navy, and one of them, the *Boston,* came very near winning a war all by herself.

The squadron was started by the signing of contracts for the building of the *Atlanta, Boston* and *Dolphin,* on July 23, 1883. The contract for the construction of the *Chicago* was signed two days later, and these dates, in addition to being of tremendous importance to the American Navy, also are worth remembering as marking the actual beginning of the great growth of the steel industry in this country.

The *Atlanta* and the *Boston* were classified under the old navy descriptions as "steam corvettes"; the *Chicago,* in reality a protected cruiser, was called a "steam frigate," while the *Dolphin* was a "clipper dispatch-boat." The *Atlanta* and the *Chicago* never had a chance to distinguish themselves in action, but the other two more than made up for the inactivities of their companion ships. The *Chicago,* considered the most powerful as to fighting qualities of the four, was 325 feet long and 48 feet wide. She was armed with guns on two decks, the upper deck armament consisting of four eight-inch rifles, and that of the lower deck of two five-inch, and eight six-inch rifles. Her protective armor plates were one and one-half inches thick, as compared with the fourteen to sixteen inches of present-day fighting vessels, and she had the then marvelous improvement of water-tight compartments below her water-line, so that, though hit beneath the belt of armor plate, she would be less likely to sink. In other words, when the *Chicago* slipped from the ways, she was the last thing in naval construction. If she were as good today as she was then, she could not whip a well-equipped submarine chaser, nor could she escape by flight from the largest and slowest of modern dreadnoughts.

The cruiser *Atlanta*, first of the famous "White Squadron" to be built in 1883, and flagship of the fleet. She also has been converted into junk.

The *Atlanta* and the *Boston* were sister ships, 276 feet long, by 42 feet beam. Their guns were all on one deck, but they introduced to naval construction and warfare the barbette which angled out both forward and aft. This was the beginning—possibly taken from the idea of the *Monitor* in the Civil War—of the revolving turret, from which almost circular gun fire could be obtained, as applied to the cruiser. These two vessels also were belted with armor plate of one and one-half inch thickness, and each carried two batteries of eight-inch guns, one forward and one aft, and two batteries, one on each side, of six-inch rifles, as well as a supply of portable rapid-firers, gatlings and machine guns. The *Dolphin,* of which more hereafter, was a dispatch-boat, and while she carried light armament and thin armor (her speed was the feature of her construction) she could set and maintain, as long as her coal held out, the then unheard-of speed of sixteen knots, which made her for some time quite the fastest fighting vessel afloat. Today most battleships, and all cruisers, destroyers and sub-chasers, exceed her speed by many knots, some of the destroyers virtually doubling it.



The battleship *Ohio*, and, astern of her, the *U. S. S. Intrepid*, once a famous member of Uncle Sam's fighting fleets, both of them in drydock at Mare Island, California. Compare the *Ohio* with the *Boston*, the *Atlanta* or the *Chicago*, and remember that these three are the direct ancestors, though it is more than forty years since they were built, of the massive and modern *Ohio*.

This entire fleet, famous as it was from 1885 to 1900, cost less than one modern battleship, though these four represented the beginnings of the present Navy of the United States, turned the eyes of the naval officers and construction engineers of every nation in the world on America, and gave Uncle Sam his first taste of prestige on the sea since the War of 1812. The *Atlanta* and the *Boston* cost $809,925 each, a total of $1,619,850; the *Chicago* cost $1,245,775; and the *Dolphin* added only $315,000 to the total, making the entire cost of the "Alphabet Four" $3,180,625. The cost of the *Montana,* latest and largest battleship of our Navy, was to have been in round numbers $5,000,000. Her hull, forty-seven per cent completed, was sold recently for junk, under the limitation of armaments plan, for $41,000 to a wrecking firm in Oakland, California.

Before we go further into the history of this, possibly the most interesting fleet the United States ever has had, let us look for a moment into the conditions which brought about the construction of the "Alphabet Four," a revolutionary and evolutionary step in the building of fighting ships. National interest in the American Navy had fallen so low at the end of the Civil War that men who were striving to maintain the standards set by that navy in the War of 1812, and in ridding the world of pirates, found themselves unable to get either moral or financial support from stingy Congresses and apathetic Administrations. Finally, in June, 1881, after more than fifteen years of almost absolute stagnation in construction of naval vessels, a board of naval construction, of which Rear-Admiral John Rodgers was the presiding officer, reported out a recommendation that several vessels be constructed at once and added to the sea forces of the nation. This report created some activity in Congressional circles, but this activity satisfied itself with the making of an appropriation for the construction of the ram *Ammen,* which seems never to have accomplished anything after it was built.

The twin-screw protected cruiser *Chicago*, once the pride of the American Navy, and now gone to the junk pile.

Matters lay thus until 1882, when Congress adopted a measure providing for the construction of a small group of vessels which should have high speed, and should be equipped with both sails and steam as power. This indefinite order remained unfilled, however, and it was not until March 3, 1883, nearly 41 years ago, that Congress passed an act definitely authorizing the construction of "three small cruisers and a dispatch-boat." In that act was laid the foundation of the present American Navy. The vessels constructed under the authority of this act were the *Atlanta,* the *Boston,* the *Chicago,* and the *Dolphin,* the latter being the dispatch-boat—the "Alphabet Four." The eager officers on the naval construction board then evolved a type of fast, armored war vessel, which, though small, compelled all the nations to change radically their ideas of naval construction, and altered to a great degree all previous plans, methods and systems of sea fighting. These naval construction experts, with farsighted vision, insisted that these ships should be built exclusively of American-made materials, thereby, as has been mentioned above, bringing into the first stages of its present great development the steel industry of this country. There were, at that time, only two plants in the United States capable of building these vessels but by consolidation and co-operation with several smaller plants, blast furnaces and rolling mills, steel enough was at last produced to build the quartet of ships.

It was not, however, until ten years after the contracts for the construction of these ships were signed that they really accomplished their purpose when, by their appearance at the World's Columbian Exposition, in Chicago, in 1893, they focused the attention of Americans on our Navy. Then, for the first time, the people began to realize the absolute necessity of a strong navy, and the immediate urgency of starting construction of the nation's first line of defense. After they had appeared at Chicago, the "Alphabet Four," better known to most Americans as the "White Squadron," steamed to several foreign ports, attracting so much attention that it was commonly charged that Uncle Sam was seeking naval supremacy among the nations of the earth. Almost immediately England, France, Germany, Russia, and even Italy started a program of naval expansion and battleship building that existed up to and through the recent World War, and, without a doubt, had a large part to do with the bringing on of that terrible conflict.

The speeds of the *Atlanta, Boston* and *Chicago,* are reported in publications of that time as fourteen knots, with a maximum, forced-draft speed of fifteen knots. The *Dolphin's* sustained speed was sixteen knots and she could do seventeen under pressure. The use of steel in the protective armor of a warship had been common following our own Civil War, but the innovations in construction shown on these four vessels worked an immediate and radical change in the plans for fighting ships among all the civilized nations.

The histories of the *Atlanta* and the *Chicago* contain few thrills, but the *Dolphin,* much as she was sneered at and often as she was called the "yacht of the official junketers," set a record which has never been excelled by any ship, large or small, before or since.

For all her life as a naval vessel of the United States, prior to the day a few months ago when she was sold pursuant to the terms of the limitation of armaments agreement, she had sailed virtually every navigable body of salt water—and many of fresh water as well—for 38 years without the loss of a single man, and without an accident with the exception of one slight grounding, when she pulled herself off without aid and without damage to hull or equipment. When the now nearly forgotten war with Spain came along in 1898, the *Dolphin,* then nearly fifteen years old, was sent out, with Commander W. H. Lyon in charge, to duty with the North Atlantic station. After that war, she was operated as a special dispatch-boat for the Secretary of the Navy, until 1916, when she was assigned to the Virgin Islands for a year, and thereafter made flagship of the patrol and special-service squadron in Central American waters until her sale to private interests.

But to the valiant *Boston,* now tied up to end her days as a receiving ship at Goat Island (old Yerba Buena) in San Francisco Bay, goes the laurel wreath for service. She was on the China station, located at Hongkong, under the immediate command of Captain Frank Wildes, and a member of Commodore George Dewey's

(*Concluded on page 14*)

How to Acquire the Greatest Charm of All

Children Should Be Taught From Infancy Importance of Pleasing Tones and Correct Speech as Mark of Culture; Foundation of Personality

By MARY E. BAYLEY

ALL of us have at some time been delighted and charmed by a beautiful speaking voice; all of us have more often been repelled by a harsh, mechanical voice. How often one fails to make the desired impression, succeeding only in tiring the listener because of indistinct articulation or fatiguing resonance of the voice.

The influence of the speaking voice in all the relations of life, business, social or domestic, cannot be estimated. It may have a calming or irritating influence. And in our daily concourse the ability to deliver words clearly, in a pleasing voice, inspires toward us not only a better understanding from others, but a better feeling. That a good voice is an economic asset business men thoroughly appreciate; many of them refuse today to employ those suffering from any defect of speech.

That the voice should be cultivated collaterally with the culture of words, the spoken word and vocal tone growing up together, even from the standpoint of health, is no longer doubted. For not only may a voice have a good or bad reflex action upon its possessor, but by the correct use of voice, tuberculosis, in many persons with that tendency, could be successfully warded off.

Where to Begin

IT IS plain that childhood is the time when the foundation is laid for the acquisition of correct speech and a pleasing speaking voice. Even a baby will listen intently and turn instantly at the sound of an unusual voice. The Hawaiian children learn to sing as readily as they learn to talk merely by listening to their parents singing all day at their work. Parents may, by means of a little care and the application of a few principles, do more and with far better results than it is possible for a teacher to accomplish at a later date. The great aim should be not to allow the high-pitched tone, nasal twang, whine or other imperfections to fix themselves in childhood, for their growth is so subtle and so deep that the work of correction in later life is apt to be slow and arduous.

Many defects and anomalies are acquired chiefly by imitation. In lisping the influence of imitation is generally admitted to be very important. Recently a physician reported having observed this speech defect in five children in one family. It had been acquired from a lisping maid. The unconscious observation of a child is very keen, so if those who surround him have linguistic defects, he may develop similar ones. In a very young child a defect of speech may appear to be attractive, but if allowed to continue it can be overcome only with great difficulty, if at all. And now where is the beginning?

First, the parents must establish an ideal, realizing that speech as well as silence can be made golden. That is, they must know what constitutes a beautiful mode of speaking; they must learn to distinguish good sounds in speech from bad sounds and accustom their children to hearing good speaking voices. Close attention to the language of others who speak better than we do will help immensely in cultivating the ear to the appreciation of vocal charm. By studying the voice that pleases and endeavoring to imitate it, much may be accomplished, since the imitative power of the vocal cords is unlimited. While at first, when trying to acquire a quality that pleases, a conscious effort is required, this soon falls into the realm of the unconscious. In others words, what was at first a conscious effort soon becomes a habit.

Essential Qualities

IN WHAT does a beautiful mode of speaking consist? The quality which we would place at the top is modulation—a voice always under control, one so disciplined as never to be irritating to the nerves or to the ear of good taste. With this there should be a natural, easy utterance, clear and distinct, carrying a full and vital expression, and having rather than a wide range of sound, beauty of tone. These are the essential qualities that make for good speaking. While they cannot all be acquired at once, parents should have them fixed in mind as a goal to be reached by their children.

And now having established an ideal of good speech, how shall we begin to work toward it?

There are three physical essentials for the cultivation of a pleasing speaking voice: Good teeth; a non-constricted, clear and open throat; nasal cavities free from obstruction.

The child's teeth should always have the best of care, for, by their neglect and subsequent deformity, the utterance may be spoiled.

The muscles of the throat should be allowed freedom of action; that is, they should not be constricted by high or tight collars, and there should be no obstruction such as excessively enlarged tonsils would cause.

Physical Defects

IN PERFECT speech the principal sounds issue from the mouth, but they must be strengthened by the resonance of the nasal cavities. This resonance cannot be properly given if in the nasal passages there is any interference such as adenoid growths or spurs of bone. Always, too, the general health must be taken into consideration. For whatever pertains to physical health immediately affects the voice. With the bodily health at low ebb, it is simply impossible to have a clear and sustained tone. This is also true where the posture is poor and the breathing incorrect. And now as to fundamental training?

First, we believe that parents should recognize and endeavor to eradicate in early life the nasal tendency, the tendency to whine or the tone pitched too high, just as quickly as they correct faulty pronunciation or grammatical construction. For it should be remembered always that the habits of speech which the child is acquiring will be the vocal habits of the adult.

In a general way the study of voice culture is divided into two parts—correct breathing and articulation and pronunciation. If given half a chance, that is, if the child is taught to stand and sit erect, nature will attend to the breath supply so far as ordinary speaking is concerned. If, however, the child's voice is thin, feeble or shrill, it means incorrect breathing. To correct this, teach the child to breathe deeply, that is, to breathe from the diaphragm (the muscle between the chest and abdomen). This means breathing from the bottom of the chest instead of from the top. While one breathes without being consciously aware of it, the art of deep breathing has to be acquired by practice. When practicing deep breathing have the child stand in a well-poised position:

Correct Posture

THE feet should be slightly apart, toes pointing straight ahead, weight equally distributed between the feet. The hips should be straight, stomach drawn in, not evidencing effort but showing the result of correct hip and chest posture. The chest should be held high with the chin lifted but not tilted. The shoulders should be dropped downward, not forced back, as they will be back if the chest is high. In this position tell the child to fill the lungs (to inhale) and to try before expiration to make a slow mental count of five, exhaling sometimes explosively and sometimes slowly and steadily. If this is done regularly for a few minutes each day, little by little the lungs will dilate and one will unconsciously increase the length of the inspirations and the slowness with which the air is expelled, until gradually the count may be increased to ten or fifteen. While, as we have said, breathing may be thoroughly unconscious in ordinary speaking, there are some qualities, not the least of which is resonance (that quality which sustains tone), that cannot be acquired without proper breath control. To be assured that resonance and carrying power are accomplished by control of respiration, one need only notice the singer who has developed vocal ability or the actress who has acquired mastery of speech. What do they do?

They breathe deeply, thus securing the proper voice support.

It is by means of the articulating muscles that the organs of speech change their relative positions and assume the attitudes necessary for the formation of the vowel and consonant sounds. In training for a correct speaking voice these muscles must be brought into play and one must learn to form consciously and correctly the many vowel and consonant sounds. The vowel sounds are the most difficult because they are what may be called open-mouth sounds. They must be made with an open throat, mouth, teeth and lips.

The vowel sounds, as given by the Director of Speech Improvement, New York Board of Education, are:

Ah, A, Ee, Aw, Oh, Oo (the *a* used is that in the word *make*).

Ah should be produced with mouth open wide, the tongue flattened with its tip against the lower teeth. Practice words—father, papa, car, barn, star, Arthur, and so on. *Ah* is the widest and freest of all sounds and is one of the first uttered; keep it forward out of the throat and down out of the nose.

A must be made as a pure tone without a diphthongal combination as *ayee*. The tip of the tongue should touch the lower teeth, but the remainder of the tongue should be slightly arched above their level. Practice words—ate, ache, blame, fate, make, baby, and so on.

Ee Care should be taken that the upper and lower teeth do not meet and that the sound be made not too thinly. The tongue is held in a position similar to that for producing A. Practice words—see, meet, need, feel, seem, eel, free, and so on.

Aw The lips are extended with the mouth well opened, the tongue slightly convex. Practice words—raw, saw, jaw, awning, lawn, gnaw, yawn, and so on.

Oh The lips are rounded and pursed forward. The tongue is held in a position similar to that for producing Oh. Practice words—ooze, spoon, too, soothe, tooth, moon, and so on.

Repeat the scale down and up until you are conscious of the changes in adjustment of the speech organs and try to associate each sound with its position. Practice this scale slowly at first, then increase the speed, keeping each sound separate and distinct. Go over it frequently until the correct habit of producing each sound is fixed. Care should be taken that the sounds are not nasal and no great muscular effort should be made. This effort is one of the major causes of throat contraction and "throaty voice."

The child should also be drilled in repeating aloud the alphabet, making sure that every letter is pronounced not only distinctly but is given the correct sound. For instance, that the letter *h* is never pronounced as though it were aitch and the letter *w* not as double yer. In going over the alphabet see that the child brings out every letter vigorously and concisely. Do not allow him to drawl the letters. Remember that the drawl is not only very apt to result in the habit of whining, but that concise and spirited expression has a stimulating effect upon the mind. In other words, it marks for the child a step toward health.

Effect of Harsh Voices

IN MEETING the difficulty of pronouncing a difficult word do not allow the child to try to say it all in one breath, thus getting the syllables mixed. Teach him to pronounce it syllable after syllable, pausing after each effort and then going quietly on.

With very young children, sweet, quiet and low tones will have more effect than much technical training. Children who never hear harsh or angry voices will never develop them. The finely modulated voice is the one which can express to the child sympathy and understanding. Teach the child to speak slowly and distinctly. Smooth, rippling, happy poems, repeated in the right tone, either from memory or as reading exercises, will not only aid in acquiring effective modulation but will help to beautify the notes.

The faculty of taking pains and a little practice with the child every day will work wonders toward acquiring a beautiful speaking voice which will soon become a habit. Let us not hesitate to take these pains, remembering always that we cannot, like a dress to be put on in the evening, have two kinds of speech, but that the child's everyday habits will mark the adult speech habits and that beautiful speech is a mark of true culture.

Teapot Dethrones Porridge Pot of Scotland

Bowl of Brose Is Passing; Will Scotch Physique Suffer?

By VICTOR MITCHELL

IT IS to be feared that the day when the average Scotsman was brought up on oatmeal and the Shorter Catechism is gone forever. The oatmeal is still there, and so is the Shorter Catechism, but neither is used in the same proportion nor to the same extent as formerly. It is with the oatmeal, however, that for the present we shall deal more particularly, especially that form of it which used to be found on the breakfast table of every Scot, rich and poor alike, in the form of porridge.

A few years ago William Howard Taft, Chief Justice of the United States, paid a visit to Scotland. The principal object of his visit was to receive the honorary degree of doctor of laws from the University of Aberdeen. In Mitchell Hall, after he had been duly clothed with the insignia of his new dignity, Mr. Taft made a speech, in the course of which he referred to his journey north, giving some of his impressions of his first visit to the land of the heather. Perhaps the most striking thing he said was that the circumstance which had impressed him most was that in the land of Burns, in the land o' cakes and "halesome parritch," he had been unable to procure a plate of the national food for his breakfast. This statement provoked some amusement, and not a little surprise, but to those familiar with the changes that have taken place in the habits of the Scottish people within the past quarter of a century or so, and which are still taking place, there is nothing surprising about it.

There is a story still current in the North of Scotland about an English tourist who tried to gather all the information he could about the country and its inhabitants, with the object, it is to be presumed, of writing a book on the subject. One day, while seated in a farm kitchen, he was much struck with the appetite which the herd laddie displayed in the disposal of his morning supply of porridge and milk.

"And do you get this for breakfast every morning?" asked the inquiring Sassenach.

"Aye div a'," answered the native, "I aye get porridge for my brakfast."

"Indeed! And what do you get for your dinner?"

"Porridge."

"And for your supper?"

"Porridge."

"Good heavens. Do you not get tired of porridge?"

"What wye could I get tired o' ma meat?" retorted the herd laddie, with a look of blank amazement. The porridge and milk was the only meat he sought or cared for, and he was content.

At one time oatmeal formed the basis of almost every dish that was supplied to the Scottish countryman, more particularly to the farm servant or cotter class. It was often taken in the form of brose. Now brose is a dish about which many Scotsmen know little at the present day, and about which the Englishman knows nothing. In its simplest form brose is composed of a handful of raw oatmeal put in a bowl with a little salt, and, while boiling water is poured into it out of a kettle, it is stirred until the mixture is of the consistency of stiff dough. It is really porridge which has not been boiled. Then the brose has milk or cream poured over it, and it is eaten in this uncooked state. It can be readily imagined that it requires a strong stomach to assimilate a mixture of this sort; but the sturdy outdoor worker throve and grew strong on it. There are other kinds of brose: beef brose, for example, in which the "bree" or juice off a piece of boiled meat was used in place of the boiling water, and in which fragments of the meat mingled with the meal; and there is "neep" or turnip brose, in which the meal is combined with mashed turnips and butter.

The Decline of Oatmeal

IT IS difficult to say what has led to the decline of oatmeal as an article of food among the Scottish people, but that the use of it, especially in the form of porridge, is on the decline there is not the slightest doubt. Eminent doctors have noted this and have deplored it, and most of them ascribe it to the rapid growth of the tea-drinking habit. In other words, the teapot has dethroned the porridge pot. In place of wholesome porridge and milk, with perhaps a piece of oatcake and butter and an egg, the breakfast menu consists for the most part of bread and jam and a slop of tea. This is much more easily prepared, much more easily disposed of, and the children as well as the grown-ups have become accustomed to it. Its effect upon the Scottish race remains to be seen, but its use—the entire change—is deplored by the best authorities.

Another of the causes which has led to the decline of oatmeal porridge as an article of food in Scotland is the introduction of easily prepared breakfast foods, foods that require little or no cooking, but of whose nourishing qualities it is left to doctors and dietitians to judge. It must be confessed that the modern Scottish housewife, while retaining many of the characteristics which have distinguished the race from time immemorial, has not the stamina or forcefulness or good, sound sense of the housewife of a former generation, and is inclined to follow the line of least resistance in her household economy, both in cooking and in the care of her bairns. She, therefore, gives Jockie or Jeannie what they ask for in the shape of sustenance, not what is good for them.

But this is more particularly the case in the cities, especially in the manufacturing centers, where there is a greater rush than there is in the country districts. The rural housewife still retains many of those sterling qualities which have made Scottish women the mothers of great men, and oatmeal porridge, oatmeal cakes, home-baked scones, and homemade jam are still included in the list of her accomplishments. The result is —and it is quite obvious even to the casual observer— that the country child is as a rule of a much sturdier frame and healthier cast of countenance than his city cousin. Perhaps pure air has as much to do with this as wholesome and plain food, but at the same time it must be remembered that in Scotland and in Great Britain, generally, city sanitation is usually equal and often superior to that of the rural districts.

Differences in Physique

IT IS therefore for more reasons than one that every patriotic Scotsman deplores the dethronement of the porridge pot in the industrial centers of the land. So marked is the difference between the porridge-fed Scot and those who have been nourished on a more up-to-date diet, that anyone familiar with conditions in the old country who witnesses the arrival of a fresh batch of immigrants, can at once detect, by their general physique, the town-bred men and women from those who have been raised in the country. This superior physique may not be altogether due to the oatmeal régime, but that has doubtless a great deal to do with it. The imbibing of tannic acid which is inseparable from tea-drinking cannot be good for growing children. and this is one of the effects of the dethronement of the porridge pot. It must also be remembered that the doing away with porridge as the principal item in the breakfast menu has a tendency to the abolition of breakfast cereal foods of all kinds, and therefore with the gradual elimination of milk, the food value of which cannot be overestimated.

There is good sound logic in the assumption of the herd boy that oatmeal porridge is not only a food but that it is "the food"; the "meat" which is to supply all necessary nourishment to the body morning, noon and night. It is therefore regrettable to find at the present day so many of the younger generation in Scotland who will tell you that they cannot take oatmeal porridge in the mornings. that it "does not agree with them." There is no doubt that when once the art of making porridge is lost, the art of eating it is lost also, because stomachs get weaker and blood gets poorer and cannot stand the substantial qualities of the fresh oatmeal.

The reason the Scottish peasantry are among the finest races in the world is because they have stuck to the porridge pot after others had abandoned it, and the bowl of brose, which is a grade still higher in the scale of super-foods, is still found in a great many districts where men toil in the fields from morning till night.

It must also be observed that in the acreage of grains grown in Scotland at the present time, the quantity of oats that is grown is far in advance of either wheat or barley. As a matter of fact, wheat is a negligible quantity so far as Scotland is concerned, and oats and barley are the staple crops; but while the oats feeds both men and horses, the great bulk of the barley feeds neither, for it goes to the distilleries for malting purposes, and the majority of the farmers in the North of Scotland raise it almost entirely for this purpose.

But for those who fear for the degeneration of the Anglo-Saxon or Anglo-Celtic race through the pulling down of the porridge pot from its former place of supremacy, there is the consolation that porridge of the oatmeal variety is eaten regularly by many thousands of people on the American continent, and that the Chief Justice of the United States is but an example of many others who look for this nourishing food as part of their breakfast menu wherever they go. There is scarcely a restaurant or caféteria on the continent where you may not procure oatmeal porridge of a kind. It may not be of the kind which aroused the poetic fervor of Burns, the kind that has nourished so many generations of sturdy Scots, but it is as near as we can get to it in this country.

The Passing of Meal "Girnel"

ONCE upon a time an essential article in the furnishing of every Scottish household was a meal "girnel," or large upright chest in which a family supply of the cereal was kept, and which was kept replenished by the regular calls of the miller with his cart laden with the freshly ground product of his meal mill. In medieval times licensed beggars were permitted to demand a handful of oatmeal from every farmhouse they called at in their wanderings over the country, and this they carried in a poke or sack slung over their shoulders. There are still a great many people in Scotland not too old to remember when the tramps used to call regularly at certain houses for the dole of oatmeal which the housewife had always ready for them; but nowadays the demand for oatmeal for the making of brose or porridge has sadly fallen away, even among the beggars.

If a law could be passed restoring the porridge pot to its former supremacy in old Caledonia there is no doubt that it would be a good thing for the country if not for the world at large, and a bill brought forward in parliament with this object in view would certainly receive a great many supporters. Wrong feeding is undoubtedly one of the greatest evils of the age, especially among the rising generation, as any of the medical officers who inspect our schools can testify. Malnutrition is not so often caused by underfeeding or overfeeding as it is by feeding on the wrong kind of food and this is as true in Scotland today as it is in any other country. "Back to the porridge pot" is therefore a slogan that every true Scotsman would like to hear.

Antics of the Antique Dealer and Collector

Concluded from page 2

to have these persons about; they are dignified, well-dressed, have an air of "knowing," and are cheap "extras." Theaters and movies have to pay for them; the auctioneer gets them for nothing, more or less.

So one sits, one opens the catalog, examines the object under the hammer, and reads:

"34 Bronze empire fender"; * * * "281 Antique miniature tapestry workbox"; "496 Spanish lace vest and collar," and so on, according to the number of items. All these in general are items of no unusual importance and may be bought either under value or above it, depending upon the auctioneer's mood, the purchaser's attitude and other more or less elusive circumstances not always predictable.

Quite often genuine and valuable furnishings are dispersed under condition that the name of the seller shall not be published or publicly announced, although the address is sometimes permitted. This happened in the case some time ago of a Vanderbilt collection. More recently it happened with the Levantine gold-thread needlework hangings and robes belonging to the Biddle family. Occasional Frick pieces have been disposed of unsupported by ownership label.

Perhaps no more interesting collection of variegated and general nature has been offered lately than the Symons collections sold at the Clarke galleries. At the last day's sale I happened to sit next to a millionaire publisher who has been spending hundreds of thousands of dollars at sales of this kind to furnish a house planned a dozen years ago and yet to be built. Aided by an agent and a lady of the family, he made a ten-thousand-dollar bill levitate from his to the auctioneer's pocket by an imperceptible nod of the head. Whether he bought the Emperor Maximilian tapestry of the fifteenth century, depicting the last days of Jacob, I did not learn. It was subject to a set-up price of $10,000. The tapestry is woven in superb colors, and was the property of a great Spanish church, to which it was presented by King Charles V. At that sale two sets of tapestries, one Les Amours by Gobelin after cartoons by Berain, said to have been woven for the Chateau at Fontainebleu, sold for $29,400, while Flemish tapestries depicting the story of Herodias, woven nearly four hundred years ago, went for $34,600, both to dealers, I believe.

It makes one dizzy to read a description like this: "EIGHTEENTH CENTURY FRENCH ROSEWOOD AND MARQUETERIE FITTED BEDSIDE TABLE OF THE LOUIS QUINZE PERIOD; on chamfered cabriole supports, the front fitted with two drawers and reading slide and covered with a parqueterie pattern of straight and cross-grain veneers laid in dice in light and dark rosewood, and bands of mahogany. Returns and back shaped at the top veneered in a similar manner with bands of straight grain mahogany; gilded scroll handles, escutcheons and appliqués." Or this: "EXCEPTIONALLY FINE SIXTEENTH CENTURY OAK COURT CUPBOARD OF THE ELIZABETHAN PERIOD; composed of a tall chest, fitted with two panelled doors with bracketed stiles which are flanked by slender fluted Ionic pilasters; molded base; headed by two jig-saw cut panels of a conventionalized tulip and husk scroll; broken ogee cornice molding. The upper part is architecturally planned with two doors, recess panelled and enriched with a quarter star in hollywood marqueterie; and the center panel carved in relief with a Flemish vase with spreading flowers, and branches carved in high relief. Flanked by boldly protruding angular and arched cove shaped pilasters, with multiplied ogee cornice and base moldings; entablature jig-saw cut, similarly to panels below; panelled sides; wrought iron and gilded fretted pear escutcheon drop handles, and hasps, in the Gothic style; armorial and scrolled key escutcheons."

And when one reads four to six hundred such descriptions, printed artistically and even illustrated in book form, one need not be surprised that such catalogs sell for $5 to $20 each, and they are in great demand, especially for collectors and museums, who thus are enabled to keep track of each change of ownership and price. The complete set of the American Art Galleries catalogs is supposed to be priceless.

One of the mysteries about furniture and furnishings is that of fashion. In the current department store advertisements the "latest fashionable furniture," is played up as if furniture fashions changed annually. Often diatribes are included against veneered furniture, whereas it is quite impossible to find a costly piece of antique art furniture, outside of the oak and walnut Flemish, Gothic and Florentine types, that is not veneered.

At these authentic sales, usually collected by connoisseurs, the chance of being led astray does not exist. Whether the prices obtaining are the true index of value none can say. Dealers set their prices in accordance with the liberality and desire of patrons, and every increase of selling price boosts prices all along the line. That is why tapestries, hangings, rugs, bronzes, marbles, vases, porcelain, colored glass and certain kinds of furniture are subject to few fluctuations.

Pulitzer Races, 1924, to Give New Impetus to Aviation

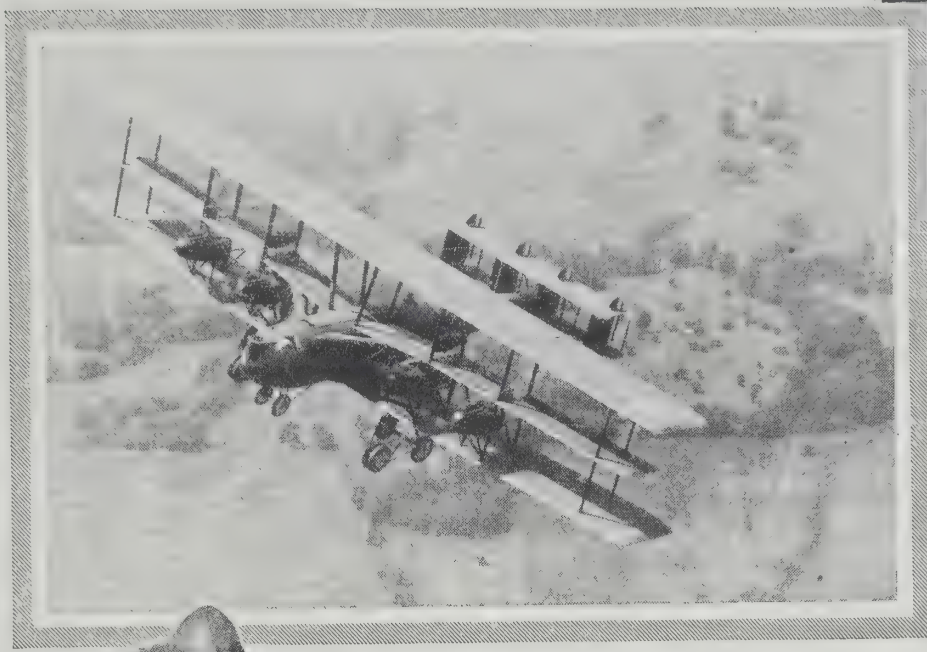
Birthplace of the Airplane Is Well Equipped for the Important Event

By

HOWARD EGBERT

FREDERICK BECK PATTERSON,

Of Dayton, president of the N. C. R., president of the National Aeronautical Association, under whose auspices the 1924 Pulitzer races will be held.



The Barling Bomber in flight.

FOR the first time in the history of the Pulitzer airplane races, this international event will be held at the birthplace of the airplane, Dayton, Ohio, and Orville Wright, co-inventor with his brother, the late Wilbur Wright, will witness the crowning distinction to the genius of this invention. These races, which will be held early next October, will be in every respect the greatest ever held in any country. Frederick Beck Patterson, president of the National Aeronautical Association, solicited entrants from foreign flying celebrities, many of whom already had announced their intention to compete for prizes.

Dayton, perhaps unconsciously, was making preparation for the Pulitzer races about two years ago when her citizens by popular subscription pledged more than $400,000 for the purchase of 5,000 acres of land about six miles to the east of the city. The plans as accepted by Secretary of War Weeks for the new air academy which will entertain the Pulitzer races call for an expenditure of at least $10,000,000 by the United States Government for new buildings at the Wilbur Wright Field. No sooner had Dayton taken up this project than the necessary money was subscribed within a week's time. Congressional action by way of appropriations for the carrying into effect of the great air program is expected to be taken before many months. When the Wilbur Wright Field project is finished it will be the largest and by all odds the greatest airplane institution in this country, if not the world. Here the Pulitzer races will be held.

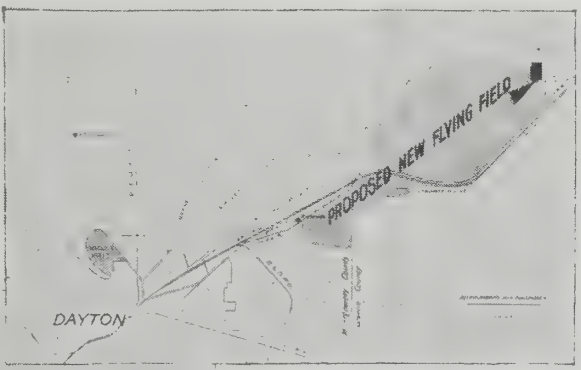
Clothing developed for altitude flying.

Major General Mason M. Patrick, of the United States Air Service, already had visited Dayton upon numerous occasions and given his unqualified endorsement to the plans which have been set in motion.

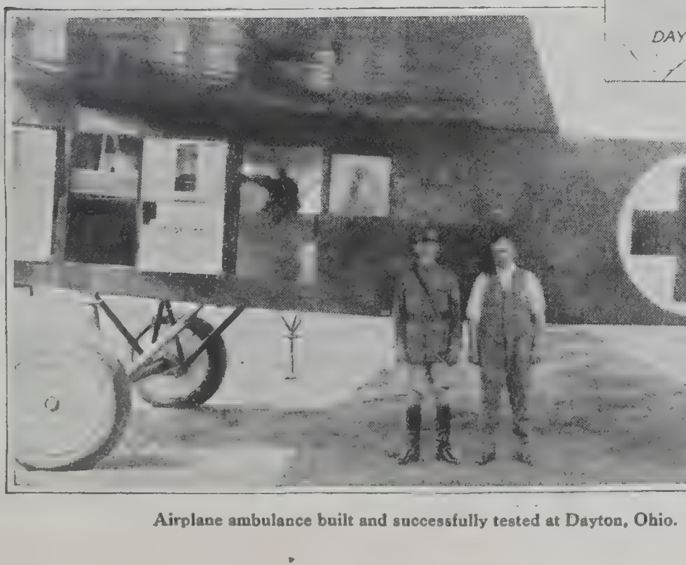
Dayton, therefore, is making preparation to entertain the thousands of visitors who are expected to be present for the 1924 event. Two main railroad lines reach the Wilbur Wright Field, and an interurban line is available. Dayton is a city of nearly 175,000 persons and is able to take care of the visitors. The Wilbur Wright Field is only a night's ride from all important centers east of the Mississippi River. Major General Patrick has said unreservedly that the Dayton field is the best available field in the country for such a purpose.

It might not be amiss to recall that at the present time the M'Cook Field, which is the engineering headquarters for the United States airplane business in the nation, is located within the city limits of Dayton. But this is not a government-owned field. It occupies leased ground. The natural advantages of the Wilbur Wright Field are many. Chiefly the wide stretches of land which will be available with the new territory added to the present equipment will offer unexcelled opportunities for airmen to "take off" for the prize flights. In all directions there are ample places for forced landings if these should become necessary. The air currents throughout this section of the Miami Valley are said to be unusually good. Every element, moreover, which enters into successful speed tests or altitude tests, will be found at the Wilbur Wright Field.

Aerial photography, as well as night flying, have received their greatest impetus in connection with the work of aviators operating out of the M'Cook Field. At the Wilbur Wright Field is located the immense Barling Bomber, which is said to have cost nearly half a million dollars in building. At present it is undergoing repairs. It may play a conspicuous part in the next Pulitzer races. Before these events transpire in October, Lieutenant John A. Macready will attempt to wrest the altitude record from the French aviator who beat Macready's record of 40,800 feet over the M'Cook Field.



Map showing location of Wilbur Wright Field and relationship to Dayton, Ohio.



Airplane ambulance built and successfully tested at Dayton, Ohio.

Besides the airplane work that is carried on in both Dayton fields, at the Wilbur Wright and the M'Cook posts, a considerable amount of balloon and small dirigible experimental work is conducted under government supervision.

The national supply depot for the airplane service is established at the Wilbur Wright Field, where the supplies for all airplane fields in the country are stored. You can get anything you want here, from a bolt to a fur-lined aviator's overcoat. The estimated value of motors, spare wings, tails, mechanical equipment and similar articles at this post amounts to approximately $100,000,000, and so the advantages of holding the Pulitzer races at this point again are emphasized by the unusual and comprehensive facilities which are offered to the flyers.

One of the transcendent benefits which is expected to follow the 1924 Pulitzer races will be the increased impetus given to aviation in the United States. The accumulated value of prizes will be larger than ever before in the history of these races. The presence of more foreign pilots will be another element that will add to the attractiveness of the events. If America has been tardy, as some of our experts have claimed we are, in the matter of aeronautical development, the effects of the 1924 Pulitzer races are anticipated to prove a most amazing stimulus to aviation progress in the United States.

This progress is essential to America if she would keep her place among the nations of the world, in peace as she did in war. For while airplanes in the past have been chiefly for military uses, indications are that future demand will be for peace purposes; that is, as common carriers for mail service, for forest patroling, surveying, aerial photographing and for sport and pleasure. It would seem that particularly in the matter of marketing perishable commodities the airplane holds the key to future developments that may revolutionize this phase of agriculture. Hence, to keep abreast of the times, America must keep step with the forward strides being made in aeronautics.

At the Dayton fields practically every modern scientific knowledge of aviation has been turned in the direction of practical purpose. Models are tested by wind tunnels for strength and durability of service. Propellers are tested. The Armament Section is intrusted with the work of synchronizing the timing of gun shots with speed of the engine; pyrotechnics for signalling at night, and analyzation of bomb racks and release mechanism. The photographic section always is active both in and around Dayton and wherever the Federal department may send them.

The world's largest airplane, the Barling Bomber, mentioned above, was built and made its first successful flight from the Wilbur Wright Field. Fully equipped it will carry 12,000 pounds of explosives and eight men. It weighs approximately 43,000 pounds. It has three planes with a wing spread of 120 feet. It measures sixty-five feet from the nose of the fuselage to the tail and stands twenty-eight feet high. It is driven by six 400-H. P. Liberty motors arranged in tandem formation. At the present time the Barling Bomber is undergoing careful examination for defects and improvements and will shortly be housed in a specially designed hangar to cost $50,000.

Every type of airplane used in America is first tested out at the M'Cook Field and hundreds of competent mechanics are available for passing aircraft of all kinds. Every day one or two machines drop in for help. Among those who are stationed here are Lieutenant John A. Macready, who with Lieutenant Kelly made the famous non-stop flight from the Atlantic to the Pacific Coast.

Dayton, therefore, believes that it is equipped better than any other city in America for handling the 1924 Pulitzer races. That's why she accepted the challenge of the executive committee of the National Aeronautical Association. She has the brains, the mechanics, the facilities and the ground. Committees already are at work preparing for every phase of the big adventure. After these races aviation in America will make more rapid strides than it ever has before, and perhaps we shall take our place alongside England and France, disclosing our genius for design and manufacture, and our ability to excel when we put ourselves to the test.

It is significant that the Washington Arms Limitation Conference declined to limit aircraft because by so doing the commercial growth of flight might be handicapped. As a result of the startling advances and the general interest aroused, perhaps no events are more eagerly watched than those of aviation, foremost among which are the Pulitzer races.

"The Greatest Single-Handed Fight"

Concluded from page 3

rage and wanted to fight. McCanles knocked him down, tied him on an unbroken horse and turned the animal loose. The horse bucked all over the landscape until it was worn out. That cured Goff of drunkenness.

"McCanles thought he was the best man in the country in a wrestle or a fist fight. He wasn't far wrong, either. A big powerful fellow was sitting with a gang of workmen on my father's porch when McCanles dropped in on a little neighborly visit. He went up to the big man and said, 'Get up. You'd orter be a good fighter.' The man stood up and McCanles felt his muscles. 'Yes,' he declared, 'you're a powerful good man but I can lick you. Step out here in the yard and we'll fight it out.' The big fellow was game and, as McCanles had said, he was a powerful good man. They fought for nearly an hour. McCanles won but he used to say it was the hardest fight he ever had in his life.

Making of a Bad Man

WHEN the Civil War broke out, McCanles determined to turn his properties into cash, go back to the South and fight for the Confederacy. Having disposed of West Rock Creek station, he sold the Elkhorn station to Ben Holliday, owner of the Overland Stage Company, in May, 1861, and moved his family to a ranch four miles away at a point where Rock Creek empties into the Little Blue River, near the present village of Endicott. He received a sum down and the remainder was to be paid in monthly installments over a short period agreed upon. Holliday placed Horace Wellman at the station as agent and Wellman was to deliver the monthly payments to McCanles.

At this juncture, Wild Bill Hickock steps into the story. He was not Wild Bill then; the McCanles fight conferred that title upon him. His name was James Butler Hickock but he was known as Bill Hickock.

Wild Bill Hickock in later years was said to be the handsomest man of his day on the frontier. Kate Schell, it is said, fell in love with him at first sight. The budding romance reached the ears of McCanles and made him furiously jealous. But he threw no lariat about Hickock's neck nor did he drag him by way of punishment at his horse's heels. The youthful Apollo, who with a bullet from his six-shooter could hit a tomato can tossed into the air and who was as dynamic and fiery a personality as McCanles himself, was not a man to be trifled with and was looked upon even then as dangerous.

When the first month's payment on the station fell due, Wellman failed to pay. He told McCanles the money had not come from company headquarters. McCanles was skeptical but waited another month. Wellman failed to pay the second installment. This angered McCanles.

At four o'clock in the afternoon, July twelfth, McCanles, accompanied by Gordon, Woods and Munroe McCanles, rode to the Rock Creek stage station.

The four riders dismounted at the barn. It is presumed Woods and Gordon remained at the barn to prevent interference by the stable hands in case McCanles got into trouble. McCanles met Wellman at the south door of the cabin. He charged him with stealing the money due him and demanded immediate payment or possession of the premises.

"I'll get your money in time, Mac," Wellman said, "but I haven't been able to get it yet."

"You're a liar," McCanles hurled at him, "and a thief to boot."

Mrs. Wellman crowded to the door as her husband retreated into the house. She was a courageous woman, noted for her sharpness of tongue, and she volleyed vituperation upon the lowering giant facing her.

"My business," said McCanles contemptuously, "is with men, not with a woman."

Wild Bill Hickock thereupon brushed Mrs. Wellman aside and confronted McCanles.

"I'm a man," he said.

"I've come to have this thing out with Wellman," McCanles replied. "This ain't no affair of yours, Bill."

"Perhaps 'tis or 'taint," snapped back Hickock.

"We are friends, Bill, ain't we?" asked McCanles.

Wild Bill did not answer.

"You send Wellman out here so I can settle with him or I'll come in and get him," McCanles threatened.

Wild Bill stepped back into the house as if to comply. As Wellman did not reappear, McCanles walked inside. He was just in time to see Wild Bill disappearing behind a blanket which curtained off the east end of the house as a bedroom.

"Come out from behind that curtain, Bill," McCanles roared.

Wild Bill stepped out with a rifle in his hands—it was McCanles' own rifle left behind when he had sold the station—and shot McCanles through the heart. McCanles staggered back through the door and fell dead on the ground at the feet of his little son.

Hearing the shot, Woods and Gordon ran to the house. Woods rushed in at the west-end door as Gordon entered at the front. Wild Bill shot Woods twice with a six-shooter and Gordon once. Both turned and ran. Woods ran around the house and fell in some weeds at the east end. Gordon staggered toward the Rock Creek bridge and Wild Bill, stepping out the front door, emptied his revolver at him, wounding him again in the back.

Death of Wild Bill

WILD BILL subsequently became the most famous of the frontier's long roll of "bad men." He was scout and spy in the Union Army during the Civil War, scout in later Indian campaigns and marshal of Hays City, Abilene, and Ellsworth, the "toughest" towns on the border in old cattle-trail and railroad building days. He is generally rated as the quickest man on the draw and the deadliest marksman with a six-shooter the West ever knew. How many men he killed is a dubious question. Buffalo Bill, who was associated with him in Indian wars and knew him intimately, once told me that the dead men who slept in Wild Bill's "private graveyard" numbered more than thirty.

Wild Bill was killed in Deadwood in 1876. While playing poker, he was shot in the back of the head by Jack McCall, who was hanged for the crime at Yankton. Though Wild Bill's death was instantaneous, his hands flashed to his guns and drew them halfway from their scabbards as he fell lifeless across the card table. When tried before a "miners' court," McCall was asked why he had not shot his victim in front and given him a fair show. His laconic answer was a tribute to Wild Bill's deadly facility with a revolver. "I didn't want to commit suicide," said McCall.

"On the Eighteenth of April in Seventy-five;"—

Concluded from page 6

Concord. Revere was captured and taken back to Lexington and the next day allowed to return to Boston.

When Longfellow wrote of Paul Revere,

> "It was two by the village clock,
> When he came to the bridge in Concord town."

he was incorrect, for Revere did not reach Concord. It was Prescott who, knowing most thoroughly the country thereabout, took to the lowlands and reached Concord and gave the alarm. He was joined there shortly afterward by Dawes, who had evaded the redcoats.

In April, 1889, the Massachusetts Sons of the American Revolution placed a tablet over the grave of William Dawes in King's Chapel Burying Ground; a tablet of bronze, which pays tardy tribute to the man who also rode into the night, that April night in 1775, on a ride fraught with as many if not greater dangers, than those which attended the ride of Revere. For a hundred years Dawes had slumbered in his tomb, unknown, unmarked. Then the "Sons" in some way had their attention called to the omission, and they set about paying him tribute. Today the tablet that rests over the Dawes tomb opens a bit of history to the tourists in Boston, for Dawes they have not heard of, and Revere they knew of, through the Longfellow poem. The tablet reads:

"William Dawes, Jr.
Patriot, Son of Liberty, and First Messenger
sent by Warren
From Boston to Lexington, on the Night of
April 18th, 1775
to warn
Hancock and Adams of the coming of the British
troops.
Born April 6, 1745
Died Febr'y 25, 1799."

This tablet is the one thing about the historic city of Boston that points to the heroic act of Dawes.

One time, shortly after Longfellow had written "Paul Revere's Ride," he was taken to task, it is said, by one of Dawes' direct descendants, for giving all the praise to Revere, and mentioning neither Dawes, nor Newman nor Prescott. Longfellow replied, it is said, that the name Revere was a poetic one, and that it would do no one any harm because the poem would soon be forgotten. But histories have been founded on that poem. Furthermore, it is very doubtful if Boston would have honored Revere in so many ways as she has, had it not been for that very readable and easily remembered poem.

Since that poem, great artists have painted pictures of a young man riding in the dead of night, through the countryside, crying an alarm, and they have called their pictures "The Ride of Paul Revere." Such a painting hangs today in the great State House in Boston. There is no picture of Dawes. The Revere home has been restored to its original form and furnishings by the Paul Revere Memorial Association. No one knows where Dawes lived. Everywhere in Boston you are confronted with the name of Paul Revere, and every once in a while you run across a bronze tablet in his honor. In the Granary Burying Ground, the Revere monument—about the only monument in that old burial place—looks imposing compared with the low slate slabs marking the other graves. One of the great playgrounds of Boston vicinity is the Revere Beach, lapped by ocean waves, where thousands go on summer days to escape the heat of the city. It was named in honor of Paul Revere.

You can buy, at the beach and in Boston, all kinds of Revere mementos, but there is no place in all New England, except on the little bronze tablet over a grave in King's Chapel Burying Ground, where one may see the name of "William Dawes, Jr., the first messenger."

And a direct descendant of William Dawes, when she took me to that burying ground to show me the tablet, admitted that no one knew whether or not the tablet was placed over William Dawes' tomb—they thought it was, but the records were not absolutely perfect. They had selected what they believed to be Dawes' tomb, but if there had ever been a marker there, it had been thrown away years before.

There are histories that mention William Dawes as the first messenger sent out that night to warn the Middlesex village and farm, but they are comparatively few. One, written by the eminent historian, VanTyne, of the University of Michigan, mentions him as "Joseph Dawes," and in the State House in Boston there is authoritative record of his courage and his brave adventure, but the histories are not school histories, usually, and therein is the pity; for, after all, it is the history we learn in our most impressionable years that we remember longest.

"Alphabet Four," Forerunner of Present Navy

Concluded from page 10

fleet, when the United States declared war on Spain. Notice was served on the American fleet by the British governor of Hongkong that, in compliance with the neutrality laws, the warships must leave the port within twenty-four hours. This was on April 24, which was a Sunday, and the *Boston, Concord* and *Petrel,* none of them much more than armored gunboats, with the colliers *Nanshan* and *Zafiro,* cleared the harbor immediately. Commodore Dewey, on his flagship, the *Olympia,* accompanied by the *Baltimore* and the *Raleigh* cleared the following morning, April 25. The commodore found himself compelled to purchase the two colliers, which had just commenced coaling his vessels, and complete the transfer of the coal at sea. The colliers belonged to a Chinese merchant of Hongkong, and he refused to allow them to put to sea with the coal unless they were bought and paid for by Dewey before he left the port. The American fleet had to leave Hongkong, and had to have coal; Dewey bought the vessels at a profiteering figure put on them by the Chinese.

Sinking of Spanish Fleet

AS THE fleet approached Manila Bay the *Boston* and the *Concord* were sent on ahead, while the larger vessels were still far below the horizon, to scout the location of the Spanish fleet. The American vessels entered Subig Bay on the night of April 30, and Dewey laid his plans to invade Manila Bay immediately. It is quite apparent from the records of the day that the American commodore never for a moment entertained the idea that the enemy fleet would or could prevent the passage of his ships into that bay. And they didn't. The one entrance to Manila Bay was guarded by a fortress rising sheer 600 feet from the water and well equipped with guns of large caliber, on Coregidor Island. An adjoining island, El Fraile (The Priest) also concealed fortifications and guns, though neither fort nor guns were as powerful as the armament on Coregidor.

The American fleet endeavored to steal past these forts in the middle of the night, but just as they were in mid-channel, the stokers on the cutter *McCulloch* found it necessary to stoke their fires. The coal, a soft variety from Japan, produced a long-continued fountain of sparks from the stack of the cutter, and watchmen on the islands gave the alarm. Coregidor opened first, with a shell which shrilled over the *Boston* and to which that doughty little "steam corvette" immediately replied with her six-inch guns. This was the actual and official beginning of the battle of Manila Bay. The Spanish forts, unable to see the American ships and apparently also unable to hit them when they did see them, failed to stop the fleet, and the Spanish ships, their commanders believing that Dewey could not pass the forts, were caught with their anchors down, within the harbor, until sunk by the fire of the American gunners.

The Spanish ships opened fire at long range, but the American fleet, with the *Olympia* and the *Boston* in the van, kept advancing until they were within two miles, before they commenced firing, and then the *Boston,* forced so far into the harbor by the necessary maneuvering that she dragged on the bottom, bore the brunt of the battle. While for a few minutes, she was stuck fast in the mud, three large guns on shore concentrated their fire on her. She replied with one eight-inch forward rifle, and silenced the shore battery, dismounting all three of the enemy's guns. A shell, however, entered the room of John Doddridge, an ensign on the *Boston,* and wrecked it, while a second, which proved to be a "dud," hit the little vessel's foremast. As this shell landed, Captain Wildes, who was smoking a cigar, is reported to have looked casually at the dead shell as it lay on the deck, and remarked coolly to his associates, "That was lucky for us." The only casualty on board the *Boston* was that of a sailor who was at the wheel, and who was struck by a sliver of metal paint knocked loose by this same shell. He sustained only slight injury from this.

Silent Forever

WHEN the Spanish-American War came to an end, the *Boston* and her officers and crew assisted in the Philippine land campaigns, and later the Marines whom she carried took part in suppressing the Boxer uprising in China. After this work had been done, the "steam corvette" returned to the United States and was placed in reserve at Mare Island Navy Yard. The old frigate *Independence* was then in use as a receiving ship at the training station at Goat Island, some two miles out from San Francisco in the bay of the same name. The needs of the service outgrew the *Independence,* and the *Boston* was given her place as receiving ship at the historically famous Yerba Buena. The training station recently was removed to San Diego, and it is probable that, before many more months have passed, the *Boston* will have followed her three companions in the "White Squadron" to oblivion at the hands of the wrecker. As it is now, she little resembles the trim fighting machine she once was, for her decks have been housed up, her guns removed and her ports closed, her engines and other equipment taken out, save for the boilers and the electric generators, which still supply steam for cooking, heating and light. Until one reads the name still painted on her overhanging stern, one would little suspect that here lies silent forever one of the greatest little fighting ships ever devised, grandmother, so to speak, of the mighty dreadnoughts that with supercilious mien roll grandly in off the Pacific to their anchorage in Battleship Acre, less than a mile away.

Americans Know Their Paris

By LEONORA RAINES

THE official guide of Paris is wise, but not so wise as his American clients, particularly when there is a combined force of them present. The exploration of European cities has been reduced to an exact science by them, and they come armed to the teeth with ken and curiosity.

Before leaving home the American has searched for side-tracks not known to the casual traveler. That nothing would get past his memory, he made notes of the "rare" things he intended to visit. Once on the spot, he searches out corners Parisians never see. He has a mania for the under-side of history.

He knows beforehand all about the time-worn places and the souls who frequented them—if only to be hanged there. He even corrects the guide who considers his erudition complete with knowledge of what the functionary calls "chief points." He knows the Paris of Victor Hugo, of Dumas, of Balzac, but what he wishes at the end is acquaintance with locations not considered of great moment with professional globe-trotters.

He begins the day by visiting the Picpus Cemetery, not so much to get a look at the tomb of Lafayette as to see the wall scaled by Jean Valjean and the small Cosette. He yearns for traces of the Temple, but finding none, contents himself with a dreamy survey of buildings in the neighborhood.

He wants to see ruins of the Bastille, and, while the guide is talking of dates and dimensions of the prison of odious memory, he is drawing mental pictures of how the walls looked with sentries snipping off heads that bobbed up from the prison wall.

The caravan visits the area of the Great Plague that devastated Paris in 1348. Looking at the lichen-covered huts that are tumbling over each other with age, and getting a whiff of the dark courts, he irreverently exclaims, "So this is the site! Not surprising there was a plague here. Let's get out of it," and the caravan motions the conductor to move on.

They pick out the Carrousel as they halt a moment under the Louvre arches, and speak of its history. What interests them most keenly is that it was in this court that the gamins headed by Gavroche stole at night to lay their hungry little bodies.

St. Lazare prison, the sometime social resort of Parisians, comes in for special eagerness from the crowd. It is familiar with the sojourn of Mme. Humbert, mother of the "financée perpetuelle"; also with another illustrious prisoner, Mme. Caillaux, who slew Gastón Calmette, editor of the *Figaro*. One of the party informs the rest that St. Lazare was the place where lepers were originally housed—as many as could be crowded into the tiny inclosure.

One of the party suggests the old Carmelite Convent in the rue des Vaugirard, where La Vallière spent her nights in prayer and corporal chastisement. The guide, who has never heard of the cloister, takes the party there under direction of a young woman who found the address in her notebook.

"Cleopatra's needle," calmly announces the guide as the van halts at the Place. The eyebrows of the Americans go up, for they know it is not prehistoric and has nothing to do with the Egyptian vamp.

A slip of a girl in horn-rimmed spectacles tells the history of the monolith and its rescue from the sea. She adds: "There were three transported from Egypt. The largest is in our own Central Park, the next largest is on the Embankment in London. This is the smallest. It marks the spot where the guillotine stood."

"Now for the old cemetery of the Madeleine."

The guide looks worried and is silent. Then they tell him to drive to the Chapelle Expiatoire, in Boulevard Haussmann. The remains of Marie Antoinette once rested there, and the tragedies of the Queen are fully commented on. Not to be ignored, the guide ventures something about the genealogy of her he calls "the German princess," and is immediately pulled up and set right by all the party.

The Guide's Architectural Knowledge

AS THEY leave the Chapelle, the escort makes a note of the origin of the wayside park, to be prepared for his next clients, and the wagon proceeds to the Church of St. Gervais, brought to mind of recent years by reason of the Good Friday Bombardment, on which occasion an American, Emma Cullen, was among the victims. An architect of the group straightens the guide on his feet when he informs him that St. Gervais of today is not the original structure, the first having been built in 1212, crude Gothic in finish.

The story of the Trocadéro Garden with its traditional monastery-convent is as familiar to the party as A B C. The foreigners rise from their seats and scrutinize the palace and grounds.

"This peak was much higher," they declared. "It was graded to be convenient to the road. The point was selected because it was the loftiest this side of Montmartre, and so that the chapel bell could be heard calling the faithful to prayer."

Passy Cemetery, built on the next peak, has to be visited again to refresh memories as to the merits of the frescoes in the mausoleum of Marie Bashkirsteff. They had all read the journal of the young Russian, and were quite conversant with the sculptor who molded her head.

They quote the lines, "Elle est venue; elle a souri; elle a passé," printed under the bust of the actress Jane Henriot, as they near her grave, and mention the fact that she had met death at the burning of the Comédie Francaise in 1900, when she returned to save her dog.

They comment on the near-by vault of James Gordon Bennet, and explain the symbol of the owl reproduced over the door. They knew the size of the fortune Bennet had left, and they knew how much his vault cost.

If It Please the Court—By G. W. BARRINGTON

UNDER the common law, it is within the power of a magistrate to fine or imprison a person who expresses or exhibits contempt for the court.

What a fine thing it is, after all, that human emotions can remain hidden. Otherwise, many of us would be mulcted in a sum approximating the inter-allied war debt, and doomed to serve in prison for a term equaling the period which began at the Great Beginning of all things, and will end with the millennium. A court is an instrument of justice, an interpreter of the law, which, presumably, is the people's will as written by its legislators.

That is theoretic, axiomatic.

In reality, a court—or, at least, some courts—recognize old General Expediency as an eloquent pleader and at his behest say, with Koko:

My purpose all sublime,
I will achieve in time,
To make the penalty fit the crime,
The penalty fit the crime.

People are taxed to defray the expense of maintaining a legislature whose province is to define crime and affix a proper punishment.

True, the sociological family probably would live more happily if the legislature met only once every twenty years, and adjourned *sine die* immediately following the chaplain's invocation; nevertheless, the legislature, crude, impulsive, inconsiderate as it is, is our chosen tool. If it is a mistake, it is our mistake, and we own the commonwealth and have the right to manage it mistakenly if we so choose.

Those learned ones in ermine are paid to look up the record, see what the farmers and tradesmen and drovers and retired and tired lawyers in the legislature have written into the statutes, and apply that law to every case on their calendars.

If the job is distasteful, there is a way out. The framers of the Constitution, in their infinite wisdom, looked far into the future, saw this day of indiscriminate lawmaking, and provided that any public official who should become dissatisfied with his position might resign.

The Court's Alternatives

NOT long ago a most upright and sympathetic jurist heard the pathetic plaint of a frail woman who had been beaten by her heavyweight husband. After having listened to the evidence and the wrangling of opposing attorneys, after having perused moldy volumes in search of precedent, the judge sentenced the wife-beater to a year in jail, offering him the alternative of kissing his battle-scarred consort three times daily for a like period.

The first-named penalty was the maximum laid down by the legislature, which, after all, has complete charge of that job; the second was a product of the judge's own brain, a horrible conception, the awfulness of which may be appreciated only by those who have seen the woman.

In addition and casting aside the grave question of jurisdiction over such matters, it is in direct conflict with that section of the Bill of Rights which forbids "cruel and unusual punishments."

Just the other day, the police judge of our city announced that juvenile offenders convicted in his court should be publicly spanked by their fond parents, with the court sitting in chambers to see that the spankmanship was flawless in technic and efficacious in execution. The alternative was—courts appear fond of alternatives—that a husky policeman, with a proper stance and a good follow-through, should wield his belt over the hapless infant until the court should cry, "Hold! Enough!"

Granting to the august court a superiority of legal acumen, if we elders, who hire the lawmakers, were juveniles, we doubtless should hesitate to submit sensitive portions of our anatomy to the hazards of such a procedure. Court decisions are proverbially slow of formation and tardy of announcement; the belt and other things might be badly damaged before the legal mind had time to function. In addition, there always is the risk of having one attorney or the other move for a recess or something *sotto voce* right when important proceedings are in progress.

Furthermore, a careful search of the statutes made and derided fails to disclose a single reference to court ceremonies participated in by doting mothers with house slippers or brawny policemen with cowhide belts.

A few weeks ago, Dr. Cook, whose account of his polar triumphs and his oil prospects have earned equal repute as outstanding contributions to current fiction, was found guilty of having advertised sundry and divers stocks over-enthusiastically through the United States mails.

The Solomon behind the judicial plate punished the offender by applying a fine of a few thousand paltry dollars, a prison sentence of a decade or so, and a lecture which no mortal would have endured willingly in exchange for the blessed privilege of taking the United States census as a sucker list and roping in all of 'em.

The fine and the prison term were matters of course, based upon the law and the jury's verdict; but the lecture was gratis, gratuitous, extra-judicial, and, it would appear to a layman, imposed with impunity and suffered in silence simply because one man was in a position to inflict it and the other was in no position to resent it.

So grinds the judicial mills. A man commits larceny or arson or mayhem, or kisses his cook or covets his neighbor's spare tire and the judge tells him to go to bed at dusk for six months, or to climb a tree and crow like a rooster, and sin no more.

About the only statute on the books which meets with general approbation among jurists is the one which assures them a pay day, and there have been hints that some of them are not altogether satisfied with its provisions.

If the court please, as a matter of simple justice, fine me a few billions.

Several weeks ago a man and a woman, both mature and untrammeled, left a western city and came to Dallas where they were married. Responding to a telegram from their former home, the police, without an atom of evidence upon which to base a suspicion that they were suspected of crime, took them to jail and kept them there for several days.

Our policemen are no better, no worse, than others about such things. All policemen appear to have a peculiar regard for long-distance complaints.

If my neighbor smites me with a clapboard, and I point him out to a patrolman and ask that he be cast into jail, the officer will insist most strenuously that I swear to a complaint, but if I live halfway across the continent from some man who trims his mustaches or dresses his hair in a fashion which offends my artistic taste, all I need do is to step to the telegraph office and lay down the price of a message, whereupon business picks up amazingly at the other end of the line.

A short time ago the police force of Los Angeles asked for a raise; that is another action characteristic of policemen in all sections and all ages.

The city commission considered the matter soberly, applied its ponderous logic to the difficult situation, and eventually decreed that such policemen as earned it should be given a raise of $20 a month. In other words, if a patrolman made a sufficient number of arrests which resulted in convictions and consequent fines which should enrich the city treasury to an extent which justified it, he should receive the maximum pay.

What do you think of that?

An officer bribed to swear away the liberty and the pelf of enough persons to make his paycheck keep the butcher and the baker and the electricity maker smiling!

Recently a chief of police announced through the press that a certain traffic law had been violated with grave consequences, and that in future he would enforce it, sternly and impartially. His argument was sound, and his arraying of the facts was masterly. In fact, he has missed his calling; he should have been a lawmaker, instead of a mere enforcement officer under oath and surety bond to enforce the law because it is the law.

He is a good horse, in the wrong stall.

Laws in Abundance

SOMETHING is amiss with the mechanism of justice. The machine may have every part intact, and there is plenty of gas in the tank, but the timer is off. Each gear and shaft appears to meet another head-on, instead of working in unity.

For legislators, we select our best intellects and bravest infant-kissers. Not satisfied, we put them under solemn oath to do their duty well, and, as an additional precaution, we place them under bond. Having thus declared our entire lack of faith in the native honesty of the cream of our citizenry, we still can say that they were the very best that our country is producing, and we point out their job and set them at it.

As a matter of volume, they are turning out the work. Chief Justice Marshall, of the Supreme Court of Ohio, is authority for the statement that we have passed more laws during 135 years of our national existence than all of civilization did in sixty centuries. Our own R. E. L. Saner, president of the American Bar Association, vouches for the correctness of these figures, proving that for once court and counsel are in accord.

As though that were not enough, judges must need do more legislating from the bench, and policemen still more with leather belts and nightsticks, so-called, though many a poor devil has been made to know that they work fairly well in the daytime.

If it please the court, where does all of this law come from, and will you kindly have the clerk write it down for us?

Such laws the infraction of which is to be punished by suffering a judicial tongue-lashing, or by tree-climbing or roosting with the chickens, ought to be emblazoned athwart the billboards so that the wayfaring pilgrim, though a fool and a student of the statutes, may read as he runs, or read and run far and fast, into the province of some other judge with another private stock of pet enactments and self-invented penalties.

URBANA ILL

BRIEFLY TOLD

The little French town of Strassburg has been made world famous through its manufacture of goose liver pies, or "pate de foie gras." Some of the families in this section have been raising geese for generations and the many flocks in the roadways are oftentimes a hindrance to pedestrians. An ordinary liever from a fatted goose weighs 1 1/2 pounds and the farmer receives approximately $1.25 a pound.

Petroleum Reserve No. 4, in Alaska, is being surveyed by a party of geologists who depend for transportation on 140 Eskimo dogs. The reserve includes an area of about 35,000 square miles in the extreme northwestern part of the North American continent.

For more than eighty years Maiden Lane in New York City has suggested the American jewelry trade. Now firms which have been established in this street for years have made arrangements to move to a new center on 47th street. This is due to the gradual trend northward of both wholesale and retail trade that has been taking place for some time.

Seven hundred thirty million feet, board measure, of ripe western yellow pine and other species of timber on the Klamath Indian Reservation of Oregon is to be sold. The proceeds from the sale, after the cutting, which is expected to take several years, will go into the tribal fund of the Klamath Indians.

In Holland the pancake is never served at breakfast. It is eaten for lunch and frequently serves as a dessert after dinner, when it is spread with sugar or preserved fruit.

There are twenty-nine National Monuments, established by Presidential proclamations. These monuments preserve for the people of the United States historic landmarks, historic and prehistoric structures, and other objects of historic or scientific interest.

The output of the various United States factories primarily engaged in the manufacture of chewing gum in 1921, the last year for which figures are available, was valued at $38,865,000. It is stated that the original industry was begun on an outlay of $55.

Radium deposits of great promise have been discovered in Durrmaul, in Czecho-Slovakia.

When salt is sprinkled on meat, fish or vegetables, it extracts water from them, forming a saline solution so strong that bacteria cannot grow in it.

The larva of the California petroleum fly lives in petroleum pools and dies when removed from them. The adult fly, resembling any small black fly, is poisoned by the very element in which it has passed its earlier life.

Foreign antiquarians are despoiling the churches of France, literally robbing them of all their artistic treasures, according to the Archbishop of Paris.

Nearly ten million persons visited the 146 national forests last year.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Two aged chiefs of the Mohawk Tribe were sentenced to two months' imprisonment after they had been adjudged guilty of stealing the famous Iroquois Wampum Belt from the parish priest of Caughnawaga, Canada. This belt, valued at more than $25,000 as a historic relic, was loaned to the chiefs who desired to decipher and interpret certain markings on the belt.

In a secluded corner of the National Museum at Washington, D. C., is hung the wall map used by General Pershing and his staff at American headquarters at Chaumont, France, during the Great War. The map indicates the location of the Allied and the enemy forces as they stood on November 11, 1918.

A new Canadian ensign has recently come into use for Canadian shipping. It is a red field with the Union Jack in the upper left-hand corner and simplified form of the Canadian arms on the field. A blue ensign on similar lines will be flown from government-owned vessels.

Mr. Waynmann Dixon, the engineer who in 1877 dug up the Cleopatra's Needle which now stands on the bank of the Thames, believes that there is a canal under the Great Pyramid of Egypt. He cites the many allusions to such subterranean waterways found in the works of Herodotus and certain Arabic works, specifically referring to an underground chamber in the hill on which the Pyramid of Cheops stands.

More than 900 traveling libraries are in circulation at the present time in Saskatchewan. In addition to this some 500 books are sent out to districts where the branch was unable to supply libraries.

Dr. Jarmilia Vessela is the first woman honored by the privilege of sitting as a judge in the new republic of Czecho-Slovakia, according to a dispatch from Prague.

Six log rafts, each 900 feet long and containing 5,000,000 feet of lumber, besides carrying deck loads of shingles and cedar poles, will be brought to San Diego, California, this year from the Columbia River. The rafts run on schedule, the first starting on June 15 in tow of a tug. They are cut into lumber by the mills at San Diego.

There are 143 Federal meat inspection stations and 112 substations in the United States.

The amount of electricity used in Italy has more than doubled during the past ten years, rising from 1,961,000 kilowatt hours to 4,281,000 kilowatt hours. Most of this electricity is produced by water power.

The Alpine Club of Canada is planning to send a party to Mount Logan, the highest mountain in Canada. The English and American Alpine clubs have been invited to send one representative each to accompany the Canadian expedition. This mountain is in the southwest corner of Yukon Territory, twenty miles east of the international boundary and is 19,539 feet high.

There is no malaria in high and dry spots as has been proved by investigators in Asia. At the foot of the Himalayas from 2,000 to 4,000 feet endemic malaria is very severe. From 4,000 to 5,000 feet endemic malaria appears to be less prevalent. The highest elevation in the Himalayas in which indigenous malaria has so far been found is at a height of 5,000 to 6,000 feet, while at 6,000 to 8,000 feet malaria is entirely absent.

Odorless fertilizer is produced in large quantities but the farmers will have none of it, so the manufacturers have to "sweeten" it with strong-smelling material, so that it will be considered effective. The ruse does no harm, because the offensive material has the same fertilizer value as the odorless product.

A Swedish capitalist has purchased 300,000 acres of land in Guatemala for the establishment thereon of a large Swedish colony, according to reports from Stockholm.

Oil poured over the sides of the auxiliary steamship *Red Island*, off the coast of Nova Scotia, recently saved her from disaster when she struck a heavy storm a few miles off Halifax. The vessel came into Halifax heavily freighted with ice, her bowsprit smashed and deck fittings damaged.

The railroad loss and damage claims on fruits and vegetables in the United States alone in some years run as high as $14,000,000.

Magazines and periodicals with "salacious titles and suggestive sex content" have been ruled from the counters and racks of Richmond, Indiana, dealers. Twenty magazines and periodicals were listed in the ban. The order is sweeping and prosecutions for violations are sure to follow.

America Deficient in Long-distance Runners

Severe Early Training Tends to "Burn Out" Much Promising Material

By A Veteran Sports Writer

AT THE Olympic Games at Antwerp, Belgium, in 1920, America was swamped in the distance events. The 1,500-meter run was won by A. G. Hill, a Britisher, with P. J. Baker, another Britisher, second. The 5,000-meter run went to the well-known Guillemot, a Frenchman, with the equally well-known Nurmi, a Finn, second. Backman, a Swede, was third and Koskenniemi, another Finn, was fourth. Not an American was included among the first ten men to finish in the event, and three Americans failed to finish. The 10,000-meter run was won by Nurmi, the Finn, with Guillemot, the Frenchman, second, Wilson, of Great Britain, third and Maccario, an Italian, fourth. Among the first six men who finished, not one was an American. The 10,000-meter cross-country race was also won by the Finnish runner, Nurmi, with Backman second, Liimatainen, another Finn, third, and Wilson, fourth. The ninth man to finish in this race was P. Flynn, of the United States Army. The historic Marathon race of 1920 was captured by Hans Kolehmainen, the Finn, who came to this country soon after the Olympic Games. J. Lossman, an Esthonian, finished second; Arri, of Italy, was third; Broos, of Belgium, fourth; Tuomikoski, of Finland, fifth; Rose, of Denmark, sixth, and seventh to finish was J. L. Organ, an American.

Only once in these games was America able to break the European supremacy, and that was the 3,000-meter team race. Here the American team finished in front. In every individual event the American colors dragged far behind. The results are set down above to show where the strength rested. The advantage was with what are known as the Scandinavian countries.

Faulty Training in Early Trials

LEADERSHIP in track and field events and supremacy in Olympic Games has become a national boast with us, and America, while performing brilliantly in the dashes and short runs and in the field events, broke badly and collapsed when competition was over a distance and high endurance and stamina were demanded. Our utter rout in these distance events became a sort of national calamity and every newspaper in the land bemoaned the failure. We were told that America must immediately set about to develop distance runners. The Scandinavian hold must be broken and the United States must establish herself supreme over distances as well as in sprints.

Four years have passed and ahead of us lies another Olympic Games. This is the year for which the United States has been waiting to show her worth in the distance races. For four years we have been preparing, but today America's chances for the distance events at the 1924 games in Paris look extremely dull and gloomy. America is apparently as poorly equipped for the events named as she was in 1920.

This scarcity of good distance runners in our country has been attributed to the fact that Americans do not go in for long-distance running as much as the English, Finns, Swedes, Italians, French and other leading athletic nations. This is true, but it does not alter the fact that, although we have fewer distance men competing in proportion to other performers, we have a larger field available than any of the other leading contenders at the Olympic Games. There are more stars "killed" in the United States than ever develop and this is due to a combination of causes, most important of which may be mentioned the following:

1 American runners start competing too early.

2 The intense competition in our preparatory schools and the lack of judgment of most of the men coaching our preparatory school track and field teams "burns out" most of the able runners and likely prospects.

3 Many of our college and scholastic athletes compete in open events during the summer months after a gruelling season in intercollegiate or interscholastic athletics. This over-indulgence is athletically fatal to the younger athletes.

4 The over-filled indoor track program in the East has a bad effect on the athletes competing.

5 Foreign runners rarely compete in more than three or four meets each season. Some of our best runners have been known to compete in twenty or more important races in one year and are in training practically the entire time.

6 The process that is destroying our distance runners is detrimental to athletes in practically all events, but the shortage is not as evident in the other events, because of the multiplicity of fine material, some of which must and does survive.

Foreign Runners Last Longer

WE ARE constantly reminded of the fact that foreign countries are stronger in the distance events than the United States. Recently a well-known writer commented upon the marvelous form being shown by a Swedish "youngster" named Wide who had done the mile run in 4:13 1/5 and "is coming fast." It might amaze this reader to learn that the "youngster" Wide, who is coming so fast, is a man thirty-five years old and that he competed in both the 1912 and 1920 Olympic Games. Wide, at the age of thirty-five, is doing the best running of his career. Yet where are Norman Tabor, John Paul Jones or Mel. Sheppard, three brilliant American cinder-path stars who competed against Wide at the Olympic Games at Stockholm, Sweden, in 1912? Abel Kiviat alone, among the old guard, remains, and he is making a none too pretentious comeback.

If Wide were the only example of this type he might be called the exception that proves the rule, but there are many others who illustrate that an athlete can be a winning contestant after he becomes thirty years of age. A. G. Hill, of Great Britain, who won both the 800 and 1,500 meter races at the last Olympics, is a youngster of thirty-seven. P. J. Baker, another Britisher, who finished second to Hill in the 1,500-meter race, will never again see thirty. Baker also competed in the 1912 games at Stockholm. Among the numerous other examples of men who are beyond thirty and are still numbered among the world's leading athletes may be mentioned Lundstrom and Zander, the Swedish stars, and Kolehmainen and Kyronen, the Finnish wonders.

Twenty-seven is the age when the average foreign runner reaches his greatest efficiency; twenty-three is the zenith of the American athlete's career. Joie Ray is perhaps the only runner of exceptional merit, running any distance less than the Marathon, who is going at top speed and has passed the age of twenty-seven. Ted Meredith, the greatest half-miler of all time, is a perfect illustration of the careers of the majority of American athletes—a world sensation in 1916 at the age of twenty-four and an absolute failure in 1920 at the age of twenty-eight. He was completely "burned out."

The wrong system has its start in the high schools of the United States. Here one finds youngsters beginning their athletic careers at the age of fourteen or fifteen. Many of them start at an even younger age. There is nothing wrong in having boys start at that age provided they are handled correctly. The average high school coach wants to bring the boys around fast, get them going at top speed as soon as possible, and he is seldom concerned with thoughts of what this pressing process may have on the boys' futures. If the youngster does not show signs of developing into a first-class performer he has a chance to survive, for the coach will ignore him more or less and will concentrate on the better prospects in the squad. However, if the boy gives early indications of developing into a star the chances are that he will run his fastest races in high school. It is not unusual to see high school runners of caliber competing in two or more races in one afternoon.

As an example we shall cite one of the leading cities in this country. The numerous high schools of this city produced five-mile runners in the last seven years and all of them should have developed into collegiate stars. Only one of these boys came through. One discontinued athletics while he was still developing and the other three were "killed off." Responsibility for their failure to gain fame rests entirely with the coaches that tutored them in high school. One of the boys was forced to run the half-mile, the mile and the relay, all in one evening and against the strongest kind of competition.

Extended Indoor Training Harmful

THREE years ago there was a youngster named Helme at Lafayette High School, in Buffalo. He won the national Amateur Athletic Union championship in the two-mile run, covering the distance in 9:34 3/5. Last year this same Helme, a sophomore at Georgetown, never beat 9:55 and was defeated in 9:58 in one race. The Shields brothers, of Mercersburg, furnish another example. Eddie, the prep-school wonder, who competed in the 880-yard run, the mile and the two-mile events and who holds the national interscholastic record of 4:23 3/5 for the mile, never demonstrated anything in college. He was "burned out" in preparatory school competition. Larry, the less promising of the two brothers and who was not pushed or pressed by the coach, finished third in the 1,500-meter run at the last Olympic Games.

The extended indoor season has a detrimental effect. Indoor running, if conducted on a limited scale, may be beneficial. Running conditions are more severe indoors than they are outdoors. The air is harder to breathe and the leg muscles are apt to become sore. The continual pounding on an indoor track and the many turns required tend to tighten up the muscles of the runner. Many more injuries occur indoors than outdoors. Most of these are injuries to the muscles of the leg or thigh, of which perhaps the sartorius is the most important running muscle. The continual pressure results in a slight fracture of the anterior superior iliac spine, due to a sudden pull of the sartorius which is then torn loose.

A glance at the eastern athletic calendar for last February discloses a meet scheduled on almost every second night. Running continually inevitably has the effect of weakening the resisting powers. Many of our near-great distance runners could become first-rate performers if only they would eliminate the indoor running or cut it down to two or three times a season. Even Joie Ray has not been exempt from these muscle troubles, and it is a notable fact that practically none of the European runners of merit suffer from pulled tendons and muscle tears.

Certain qualifying factors do exist in the case of the United States. It is practically impossible to develop distance runners in the climate of the Rocky Mountains and the South Pacific Coast. Our runners are not used to the 5,000 and 10,000 meter events and it is asking too much of an athlete to develop a new pace for an event for which he has only a few weeks of practice. The events mentioned are not included in our college programs and therefore the athletes, who practice for only such events as those in which they compete, do not take up the long runs until after leaving college. It requires years sometimes for a man to perfect a pace for a long race.

The system of excess competition is affecting performers in other events as well as the distance men. Those who have observed Gene Goodwillie are of the opinion that he will never be any better than he is today because of the great amount of competition that he has entered in the last two years.

Two years ago Johnny Cameron, a sprinter from the Evanston, Illinois, high school, was one of the best dash men in the country and today he is unheard of, for he was "burned out" in preparatory school. The University of Michigan is familiar with the case of "Red" Weekes, a Battle Creek, Michigan, schoolboy who ran practically every race that was scheduled while he attended high school. He was one of the best scholastic quarter and half milers in the country. When he came to Michigan he was pronounced "burned out." Coaches try to nurse men of this type. At every institution of any size in the country will be found former high school stars who were sensations in their preparatory school days. Coaches work with them unceasingly, trying to bring back the reserve power that track men call the "kick," the thing that distinguishes the excellent performer from the mediocre. Less than ten per cent are ever brought back to that stage where they can maintain their own with the best of college performers. One may come back for one great and last spurt, but it is rare indeed where you find one who returns for a stretch of time.

Too Much Work "Kills" Runner

WHILE the system has a bad effect on all athletes, it is the distance man upon whom it has the worst result. The average distance man, strange as it may seem to you, is of frail and wiry build. It is not unusual to see a star distance man slump badly for an entire season as the result of a cold that would not affect a sprinter or field event performer. In the Western Conference last year Davis, of Michigan, and Scott, of Illinois, were both badly off form due to a cold.

Among the college stars who had a bad season in 1923 due to too much work may be mentioned Burke, of Harvard; Higgins, of Columbia, and Krogh, of Chicago. Burke, an excellent prospect and a man who had already beaten 4:20 in the mile, was called upon to run the quarter and half mile. Higgins was asked at various times to run the half, the mile and the two-mile events. Krogh was at the most a prospect but at the indoor meets and before the siege of overwork began, he looked like a genuine runner and had a "kick" at the finish.

There is a certain type of runner who would make an excellent distance runner and who should be limited. Charles Mellor is a striking example of this type. Mellor is practically useless in any event of less than ten miles distance. If he and others of his type would only limit themselves to the distances to which they are best suited, America would have a representation at the Olympic Games that would rival the best of the European countries. In fact, Mellor and Zuna have at times looked just as good as any of the European stars. Four races a year is quite sufficient and no man engaging in distance races should compete oftener than on an average of once every three months. In the distance events there is a reserve strength needed that is not called upon in other events.

Most of the charge of bad management made in this article has been directed against preparatory school coaches, but the colleges have contributed their part to this national athletic mistake. The college coaches have "killed off" their share of excellent athletes who were headed for the peak. At the present time two of the best prospects for the mile run are attending midwestern colleges but if the coaches who have them in charge continue to overburden them they are certain to break under the strain and instead of having a star in one race the coach will have a man who can win at nothing.

Win at Any Cost Spells Ruin

THE chief trouble with coaches is their mania for winning, and next comes winning at any cost. Whenever they get a capable athlete, instead of conserving his talent and directing it to the event where he is best fitted for competition, the coach will overtax him and give him more events than he can possibly compete in. His task will be, in many instances, superhuman. Naturally, he breaks down under the strain.

Smaller colleges have been accused of being the worst offenders. They get few really high-class performers. Boys with marked ability like to go to the big universities, and, since competition among them is keen, the boy naturally has an opportunity to attend one of the leading institutions of learning. So whenever the moderate-sized college gets hold of a good man, he is trotted out for every event he can possibly enter. Many small colleges have cheated themselves of national fame by doing this. Overtaxing their best athlete may win them a few dual track meets but how much greater the fame in having a champion at one certain event which they might have had by permitting the boy to concentrate on the one event for which he was quali-

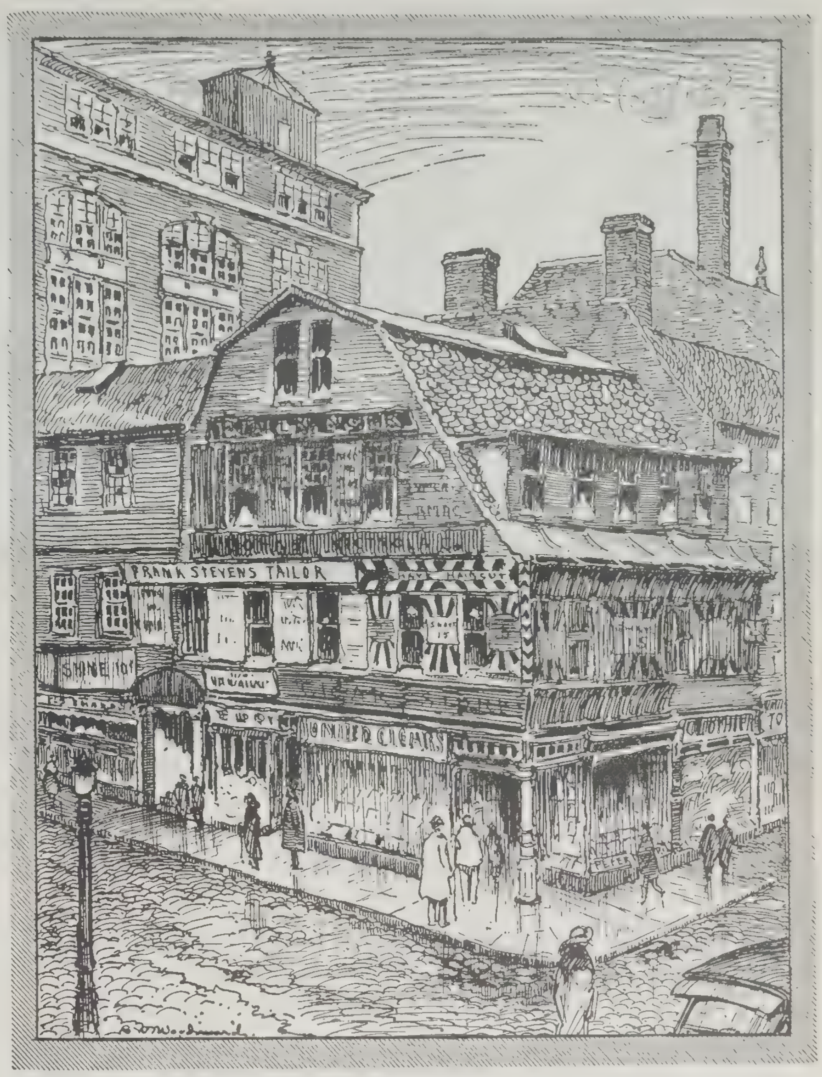
Memory of the Old Corner Bookstore Recalls Golden Age of Letters

Names of Famous Writers of Past Century Associated With Historic Shop; Many Literary Ventures Born in Atmosphere of Parnassus Corner

By MAY B. WHITING



The Old Corner Bookstore.

A BARBER shop, a tobacco store, a shoe-shine parlor, an armchair lunch—what are they doing in the abode of the gods? Either they have lost their way or the gods have passed their twilight, or else times have greatly changed. There they are, with striped signs, and tarnished lettering, and trumpery wares displayed in every window of Parnassus Corner, for so, in Boston's Golden Age of letters, was the old bookstore at the junction of Washington and School streets called. The glory of those days has departed, and probably never again will a single group reign supreme in our literary world.

The Old Corner Bookstore is very ancient, some say the oldest brick building, except one, in Boston. But ancient as it is, its site has a far longer history and a deeply tragic one. Here was built the house of the first-comer among the founders of Boston, Mr. Isaac Johnson, a man of wealth and culture. His wife, the gentle and lovable Lady Arbella, who came "from a paradise of delight and plenty she enjoyed in the family of a noble earldom into this wilderness of straits," did not thrive in the damp lands to the north where the colonists had passed the first winter, and Mr. Johnson was in hopes that new scenes might help restore her health. Blaxton, who was then living alone on the peninsula, received him kindly, and he set to work on his house with all haste. But before it was finished Lady Arbella passed away, and he moved into it, a heartbroken man. A few weeks later he died of grief, and no doubt Dudley, Bradstreet and Endicott followed his bier to a field some little distance from the house where he was buried, the first grave in what is now called the Old South Burying Ground, adjoining King's Chapel. Such, at least, is the story as we have it from Judge Sewall who, in his youth, knew the aged Bradstreet, and in our day it has been retold in the publications of the Bostonian Society.

Anne Hutchinson Banished

AFTER the death of Isaac Johnson, the house became the property of William Hutchinson and his wife Anne. Anne was a woman of brilliant intellect, and, unfortunately for her, of ideas beyond her time. From the first she was a tower of strength to her weaker sisters, nursing the sick and encouraging the weary-hearted. Then she invited the women to her house for a weekly meeting to discuss the sermon of the previous Sunday, as the men were accustomed to do, and before long she acquired such an ascendancy over the thought of the town that a second weekly meeting was held, open to both men and women. Her most distinguished follower was the young Sir Harry Vane, and with him no doubt came the titled visitors who occasionally were his guests.

All this was by no means pleasing to the authorities, or to those who considered themselves authorities, and little by little there arose against Anne a deep hatred, mingled with fear lest her teachings bring dissension in the new plantation. She was tried by a court sitting in Cambridge, for she had too large a following in Boston, and when admonished to acknowledge her misdeeds, not the least of which was "dishonoring" the ministers, she replied, "I do acknowledge no such thing." But friends and courage availed nothing. She was sent forth into the wilderness, finding a refuge among the Narragansett Indians in Rhode Island. No doubt her persecutors would be confounded if they could see the beautiful statue in her name by Cyrus Dallin that adorns the State House lawn, while their own names are almost forgotten.

Old Isaac Johnson House Burns

WILLIAM HUTCHINSON'S brother, Richard, next owned the property, and then it came into the hands of a brazier, William Shrimpton, a very honest man. It seems that he must have been superlatively so, for he never cheated the Indians. The story is that when the English dunned the tribe of the Narragansetts for a debt, they brought their copper kettles to him, waiting in single file before his house while he weighed them and paid out the purchase money.

In 1711 there was a fire in Boston, commemorated by Increase Mather in one of his most stirring sermons, "Burnings Bewayled." Judge Sewall writes in his diary, "A Dreadful Fire happens in Boston. It broke out in a little house belonging to Captain Ephraim Savage," and then he continues to give the cause as the "Drunkenness" of one of its inmates. This conflagration destroyed the house built by Isaac Johnson in the sadness of his heart, and sheltering after him a still greater tragedy.

The next year Thomas Crease, an apothecary, built the present structure. He had his shop in the front part, and used the rest of the rooms for a dwelling. The building always seems to have been used, at least in part, for trade, and we find some references to assemblies of brocade-clad ladies and gentlemen with powdered hair. Toward the close of the century the descendants of the Hutchinsons, in the families of Brimmer and Inches, came into possession of the property. The last apothecary shop was that of Dr. Samuel Clark, father of James Freeman Clark, whose youth was spent in the historic spot.

Just about a century ago the building became a bookstore. Carter and Hendee opened there in 1828, building in the rear a wooden structure to house their presses which, at first, were run by a team of Canadian horses. In a few years William D. Ticknor took over the property. Mr. Ticknor was a dignified, impressive figure, who soon made the influence of his personality and his methods felt wherever books were written or bought. It was he who presented Longfellow, Lowell, Whittier, Hawthorne, Tennyson, De Quincy, Browning, to the American public, and it was under him that the principle was established, now incorporated in our laws, that an author is entitled to share in the profits of his work.

In 1831 a lad, James Fields, came down from Portsmouth, New Hampshire, to work in Mr. Ticknor's store. Money was not plentiful then, and it was the custom for business men to take some of their employes into their homes in part payment of their wages. Young Fields was fortunate enough to be a member of the Ticknor household, where he improved every opportunity. In the store, there never was a more enthusiastic clerk. Soon he acquired an almost uncanny knowledge of the public taste. When a customer entered he would whisper to his fellow clerks what the stranger had come for, and an astonishingly large number of times he guessed right.

A Literary Retreat

AND the customers of the old Bookstore were well worth observing, for here came all the learned folk of the city, and every visitor of distinction from abroad. Fields himself tells of remaining up until past midnight on the occasion of Dickens' first visit to America and of following the stranger on his explorations about the city, sometimes drawing near enough to hear his comments. In later life Dickens and his one-time shadow were fast friends, the former making the Fields household his home when in this country.

After some years of experience, Mr. Ticknor took Fields into partnership and then the days of the greatest glory for the Old Corner Bookstore began. The strict business integrity and sound judgment of the older man, and the versatility and real genius for friendship of the younger, made a combination that did much to justify Hawthorne's comment when he wrote to his publisher of the "Paradise at the Old Corner Bookstore." Hawthorne himself loved to linger for hours in the busy shop, not in conversation with the group that came to Mr. Fields' green-curtained sanctum, but rather in a secluded corner where he could watch the flow of life unseen. Here came Longfellow, Emerson, Holmes, Thackeray, Whittier, Henry Ward Beecher, Mrs. Stowe, Lucy Larcum, the leading lights of the stage, and Ole Bull with his violin.

This was in the palmy days of New England lecture courses, and many a tour was arranged at the Old Corner. The lyceum of those days was not the jazzy institution of today. We have fallen on days where a conviction that pierces modern superficialities is almost a certain barrier to a place on the platform. No tender prejudice must be bruised by honest speech today. But there was an epoch in our people's history when they regarded it as an intellectual duty to attend lectures which assailed their cherished views. That is how political questions were threshed out. That is how abolition began. That is how prohibition began. The great lecturers of the past were all reformers. But what small town Chautauqua could endure a reformer today? We have fallen to the level of Swiss bell ringers and trained canaries.

The Passing of the Old Corner

HERE, too, the tickets for the Lowell lectures were distributed, and so great was the thirst for knowledge that on one occasion a window was broken to get at the coveted tickets of admission. No wonder Boston got its name as the intellectual hub of the universe. The Lowell lectures still are given and noted men in every field of thought contribute to their reputation by appearing there, but it is one of the few remaining landmarks of old Boston's intellectual zeal.

At one of its counters the Oliver Ditson music publishing business was started, and at the desks at the back the *Atlantic Monthly* was edited. In the rear of the building was Mrs. Abner Brown's coffeehouse where authors could meet and dine, discussing the literary gossip of the day, if the unusual meter of "Hiawatha" would kill the poem, or if Hawthorne would lose every cent in his quixotic financing of Miss Bacon's book, which launched the Shakespeare-Bacon controversy.

For many years the glamour of its literary glory hung about the Old Corner. When Ticknor and Fields removed to Tremont street for more commodious quarters, they established an authors' parlor, but it never rivaled the "green-curtained corner" of the Old Bookstore. The younger writers, Howells, Aldrich, Lathrop, continued to visit it as a literary mecca.

Impress Felt Today

BUT generations pass, conditions change, and twenty years ago the last of the bookshops removed to Bromfield street. But the structure remains, a shoe-shine parlor, a victrola shop, a tobacco store, in the lap of the gods.

The Old Corner, however, has left its mark for good on all Boston bookstores. No new store is opened now but what strives for the atmosphere of welcome and leisure which the Old Corner established. The habit of "browsing" is encouraged. A Boston bookstore, even some of the more notable secondhand bookshops, has an air of distinction hardly to be found outside Old London. Many publishers have their own stores, and one can still see from the street the stairways up which manuscripts have been carried, and are carried still, which scarcely escape the thunders of the presses ere they are hailed by the trumpets of fame.

All Little Pals Together—To Save the American Farmer!

ALBERT D. LASKER,
Former head of Shipping Board.

AARON SAPIRO,
Organizer of American farmers.

HON. E. MEYER, Jr.,
Former head of War Finance Corporation.

(C) Harris & Ewing

HON. B. BARUCH,
Former head War Industries Board.

Jewish Exploitation of Farmers' Organizations

II. The Story of the Sapiro Boys

By ROBERT MORGAN

THE history of Jewish attempts to seize control of the agricultural and horticultural resources and production of America begins with the employment by the late Harris Weinstock, then head of the California State Market Commission, of a young Jewish attorney, named Aaron Sapiro, as counsel for and legal adviser to the commission. There is nothing to indicate that the commission and Mr. Weinstock could not have used the state's legal department for such business as they had to transact with the courts, but a glance at the names of employer and employe will furnish at least one of the reasons for the opportunity so opened to Mr. Sapiro.

About two years were required by the new legal adviser to grasp the plan by which the co-operative marketing associations of California, then as now under state control, could be "improved." As soon as this plan had become well formulated, Sapiro left the state commission and branched out as "organizing legal counsellor" for co-operative marketing organizations. Despite the statement of Herman Steen, panegyrist for Sapiro, that "nineteen out of twenty of the co-operative marketing organizations" were not functioning properly or profitably prior to the coming of this "counsellor," it is a fact that the farmers in these associations, though prices for their products were lower then than now, received more money, net, acre for acre and tree for tree, for their crops, than they received last year.

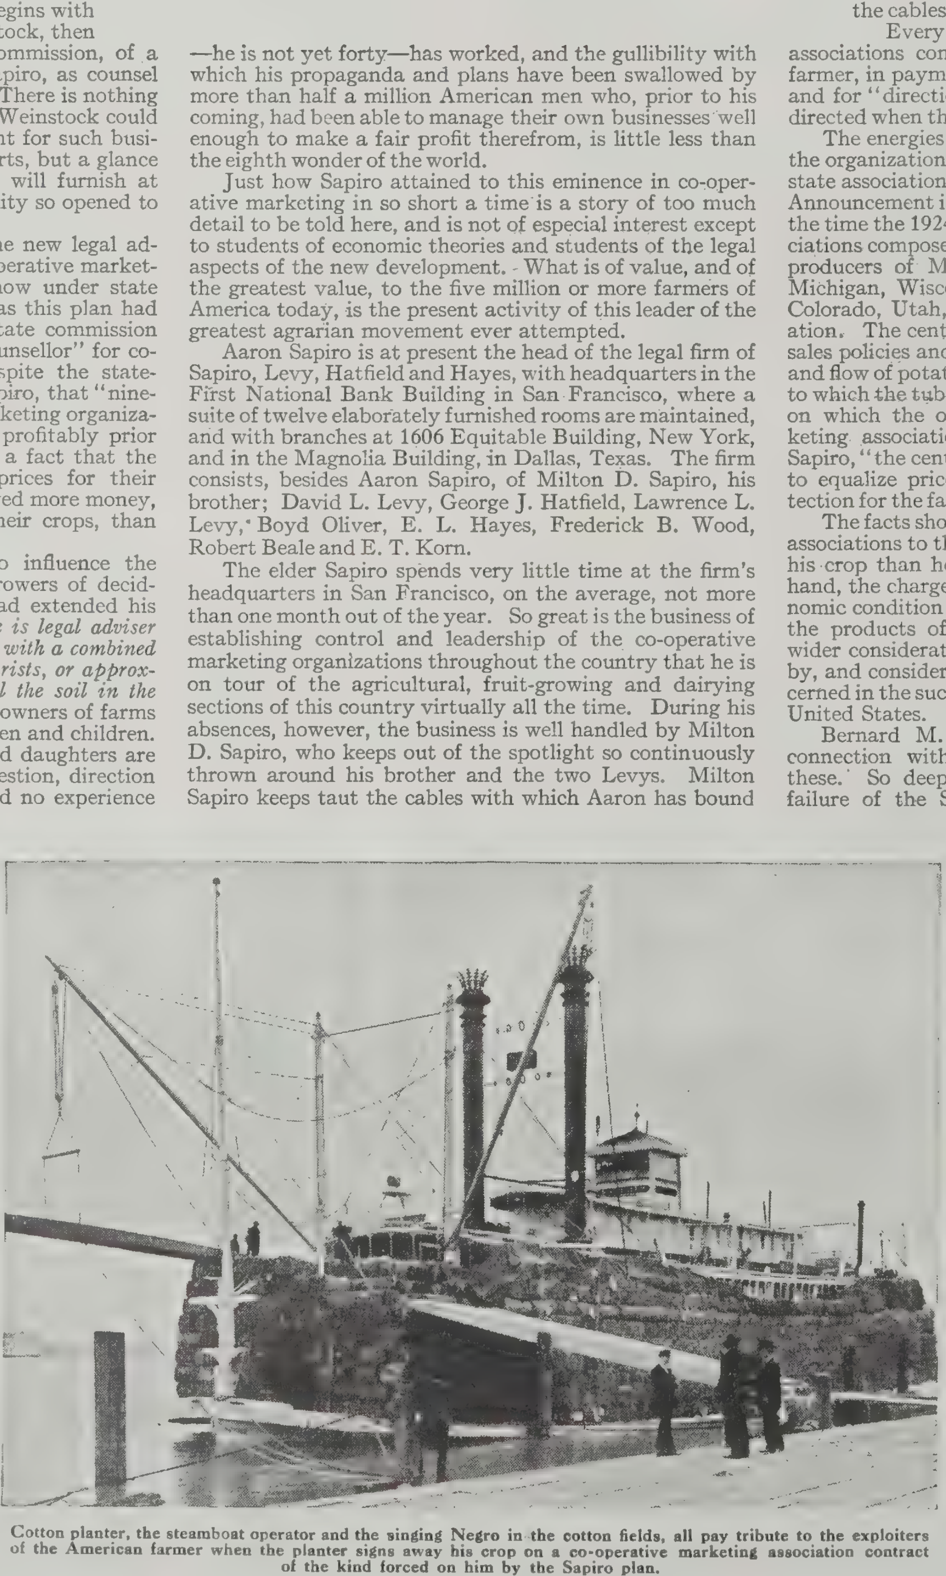
Nevertheless, Sapiro was able so to influence the farmers of California, particularly the growers of deciduous fruits, that within two years, he had extended his activities into a dozen states. *Today, he is legal adviser to sixty co-operative marketing associations, with a combined membership of more than 500,000 agriculturists, or approximately one-tenth of all those men who till the soil in the United States.* Back of these half-million owners of farms and orchards are at least two million women and children. These men and women and their sons and daughters are absolutely dependent on the advice, suggestion, direction and control of this attorney. He has had no experience in agriculture or horticulture in any form; he never has produced a dollar from the soil; he knows nothing of the problems which confront the farmer, save what he has read in books; he is not a producer of anything except ideas which require his personal employment by the American farmer. *Yet, seventeen states have altered their laws to conform to his plans of co-operative marketing*, and to enable farmers to fix prices for their crops at his command. *Forty-seven states contain associations whose members have pledged their crops to boards of directors obedient to Aaron Sapiro, and have pledged not one crop, but all the production of their lands for periods of five to seven years.*

Not a dollar can be paid by any purchaser to these American farmers unless the boards of directors of their associations—boards a majority of whose members are selected by Sapiro, or whose selection meets with his approval—permit it to be paid. These farmers must deliver the crops from their own lands, the production of their own supposedly independent and free American labor, when and where and to whom Sapiro directs, and accept for it the price his agents, or his representatives, or his boards of directors have fixed for it. The rapidity with which this young man—he is not yet forty—has worked, and the gullibility with which his propaganda and plans have been swallowed by more than half a million American men who, prior to his coming, had been able to manage their own businesses well enough to make a fair profit therefrom, is little less than the eighth wonder of the world.

Just how Sapiro attained to this eminence in co-operative marketing in so short a time is a story of too much detail to be told here, and is not of especial interest except to students of economic theories and students of the legal aspects of the new development. What is of value, and of the greatest value, to the five million or more farmers of America today, is the present activity of this leader of the greatest agrarian movement ever attempted.

Aaron Sapiro is at present the head of the legal firm of Sapiro, Levy, Hatfield and Hayes, with headquarters in the First National Bank Building in San Francisco, where a suite of twelve elaborately furnished rooms are maintained, and with branches at 1606 Equitable Building, New York, and in the Magnolia Building, in Dallas, Texas. The firm consists, besides Aaron Sapiro, of Milton D. Sapiro, his brother; David L. Levy, George J. Hatfield, Lawrence L. Levy, Boyd Oliver, E. L. Hayes, Frederick B. Wood, Robert Beale and E. T. Korn.

The elder Sapiro spends very little time at the firm's headquarters in San Francisco, on the average, not more than one month out of the year. So great is the business of establishing control and leadership of the co-operative marketing organizations throughout the country that he is on tour of the agricultural, fruit-growing and dairying sections of this country virtually all the time. During his absences, however, the business is well handled by Milton D. Sapiro, who keeps out of the spotlight so continuously thrown around his brother and the two Levys. Milton Sapiro keeps taut the cables with which Aaron has bound the farmers in the associations, and the Levys attend to the legal repairs necessary to prevent breakage in the cables.



Cotton planter, the steamboat operator and the singing Negro in the cotton fields, all pay tribute to the exploiters of the American farmer when the planter signs away his crop on a co-operative marketing association contract of the kind forced on him by the Sapiro plan.

Every dollar that comes into this firm from these associations comes out of the pockets of the American farmer, in payment for "services" which he does not need, and for "direction" of his associations which were better directed when the farmer did the directing himself.

The energies of Aaron Sapiro are now being devoted to the organization of the potato growers of this country into state associations, to be followed by a national association. Announcement is made at the Sapiro headquarters that, by the time the 1924 potato crop is ready for the market, associations composed of at least seventy per cent of the potato producers of Maine, New Jersey, Virginia, Minnesota, Michigan, Wisconsin, North and South Dakota, Idaho, Colorado, Utah, Nevada and California, will be in operation. The central or national organization will direct the sales policies and sales prices, transportation, distribution, and flow of potatoes to market, as well as name the markets to which the tubers shall be shipped. This is the same plan on which the other Sapiro-controlled co-operative marketing associations are operated, and, to quote Milton Sapiro, "the central body will control the distribution so as to equalize prices and conditions everywhere as a protection for the farmer."

The facts show that the farmer is not protected by these associations to the extent that he receives any more net for his crop than he received before, but that, on the other hand, the charge to the consumer is increased. The economic condition created by the Sapiro plan of control of all the products of the American farm, however, deserves wider consideration later. Let us for the moment pass it by, and consider the other Jewish gentlemen who are concerned in the success of the exploitation of the farmer in the United States.

Bernard M. Baruch, known best, perhaps, for his connection with the Wilson administration, is one of these. So deeply is he concerned with the success or failure of the Sapiro plan, that he signs his name to the official foreword of a book called "Co-operative Marketing, the Golden Rule in Agriculture," by Herman Steen, managing editor of *The Prairie Farmer*. Though this foreword is very like the main text of the book in style and substance, the signature at the end of the foreword leads the reader to believe that Mr. Baruch is responsible for it. In this foreword appears the following appeal (and also warning, if read aright) to farmers to refrain from objecting when the high overhead, heavy salaries and other extravagances take their money:

> "Mistakes will be made in co-operative marketing: they are made in all human affairs, and only experience can finally point the approximately perfect way. Here and there will be losses, due to mishaps which cannot be avoided or foreseen. When these arise, the members of the co-operatives should deal with them loyally, practically, and tolerantly; and, if they are led by the high type of business executive which the work demands, they will win through. For it is the man, more than the organization, who will win or lose for the co-operatives, and those farmers *who allow themselves to be agitated by the so-called high salaries paid for co-operative executives are fighting against their own interests.*"

In other words, Mr. Baruch says to the farmer: "Never kick at the price you have to pay for an executive in whose selection you have no voice." Those who have followed Mr. Baruch's history will see something in this statement; those who have not followed it would do well to learn it, and then remember that, ever since the Wilson administration went out, Mr. Baruch has been willing at all times and in all places to advise the farmers, and others, to mortgage themselves, through the co-operative associations, to certain bankers who operate either with or without governmental aid.

Incidentally, it is worth mentioning that Mr. Steen's book, mentioned above as containing Mr. Baruch's enlightening "foreword," is published by the American Farm Bureau Federation, according to a statement in the introduction, signed by Samuel R. Guard, of the department of information of that federation. Mr. Guard further adds that this volume is not propaganda, yet the name of Aaron Sapiro appears on twenty-five different and widely separated pages. Mr. Sapiro neither devised, invented, originated, developed nor improved the co-operative marketing system. All that he has done has been to collect the co-operative associations into one huge machine which can be controlled and operated by one group of men for the benefit of persons who never have been, are not now and never will be tillers of the soil.

We have now considered the connection of Harris Weinstock, Bernard M. Baruch, Aaron Sapiro, Milton D. Sapiro, Mr. Lasker, Mr. Honig, the two Levys, and some other gentlemen of Jewish origin, as well as the eulogist, Mr. Steen, with the control, direction and—let us say—"expansion" of the American farmer. When, as invariably happened, the local branches and the regional associations, under the Sapiro plan, felt the pinch of extravagance, poor management, ignorance of the workings of the inexorable law of supply and demand, and violation of other economic laws, they had to have money. Where the farmer, operating in his successful local association, without the assistance of legal advisers, had been able to operate on a business basis, the new associations turned to the banks. And where should they turn but to the Jewish bankers? If not, why not? The farmer, in the old days obtained such money as he needed from his local bank, and does so obtain it yet in those local associations which have been level-headed enough to refuse to be swept into the Sapiro plan. Today, his association goes to New York for its money, and the farmer pays the freight.

In the winter of 1922-23, Otto H. Kahn, leader of the Jewish international bankers on this side the Atlantic, gave a dinner to Aaron Sapiro in New York. Press agents for Mr. Kahn and Mr. Sapiro told the world that this dinner was given "to create a better and more intimate understanding between the financial and the agricultural leaders of the country." Not a single farmer attended this dinner, for the simple and effective reason that not a farmer was invited, but all the Jewish "agricultural leaders" of America, none of whom ever plowed an acre, planted a seed or harvested a crop, were there.

At this dinner, Aaron Sapiro, as the dean of the "agricultural leaders of America," made the principal address. His subject was "Why the California grower is running away with the eastern market." After comparing his plan to control the farms and the farmers of the United States to the operation of the United States Steel Corporation, especially as to selling methods, Sapiro said:

> "The California farmers, by pooling their products and having a central business organization of experts to sell them, have adopted the same methods the United States Steel Corporation uses. We know our markets; we have a complete outlet for our perishables; we store our non-perishables, and we feed them out in such quantities as the buyer will absorb at a fair price. And because we are a sound business organization, we can borrow money from the banks, so that the farmer who has once pooled his crops does not have to wait for full payment until they are sold. During the past twelve years, financial institutions have loaned *us* —(Mr. Sapiro has not been in the co-operative marketing business for twelve years—R. M.)—more than a billion dollars. *In 1921, the War Finance Board advanced seventy million dollars to co-operative organizations*, and if there was a single loss, I haven't heard of it."

Aside from the facts that not one of the associations under the Sapiro plan has been able to maintain a "fair price" for the products of its members; that the farmers in these associations were not paid for their 1922 crops until late in the fall of 1923; that the 1923 crops were not paid for in January 1924; and that the losses in these seventy million dollar loans, as well as the interest charged, were borne by the farmers, and not by the bankers or the Jewish directors—aside from these few corrections, Mr. Sapiro's statement is true.

In return for this speech, Mr. Kahn informed the "agricultural leaders" gathered around his banquet board, that Mr. Sapiro is "the most sought-after business man in this country." It was further announced at this dinner, though a lesser financial light than Mr. Kahn made the statement, that Mr. Sapiro "had pulled the prune growers of California out of one of the worst holes that a group of agriculturists had ever found themselves in." It will be shown later that the prune growers of California are today in worse condition than they ever have been, due to the expert work of the "high-salaried co-operative executives" for whom Mr. Baruch came so valiantly to the front. In addition to this it should be added that the prune growers are headed for worse trouble in 1924-25 than they met in 1923-24.

The demand which called for $70,000,000 in loans to carry over the unfortunate farmers, whose crops the Sapiro-directed associations were unable to sell in 1921, has increased to rather more than $100,000,000 in 1924. This is a "neat sum" to be loaned at seven per cent, with the best farming lands of America as security, and it would be surprising, if, with seven million dollars or more in sight as clear profit every twelve months, the international, as well as the national, bankers were not attracted to it. The names of the bankers who participated in these life-saving loans to the farmers whom the Sapiro plan already had "saved," indicate that the financiers of Jewish origin got the lion's share.

So next we find the managing director of the War Finance Corporation which, according to Mr. Sapiro, advanced the necessary seventy millions to the farmers in 1921, defending the co-operative marketing associations. For those who are not familiar with these matters, it may be said that Mr. Eugene Meyer, Jr., is this defender of the faithful. In an interview given out at Denver, October 29, 1923, Mr. Meyer, speaking directly on the subject of the grain trade, but including all the co-operative associations in his comment, said in part:

> "Although there is a growing appreciation everywhere of the fact that the co-operative marketing movement offers at the present time more promise of helpful results along sound lines than any other program that has been suggested, two elements are opposing it. On the one hand, it is being attacked by some of the grain dealers, and on the other, certain elements are belittling it because it interferes with their program of virtual socialization of the grain trade."

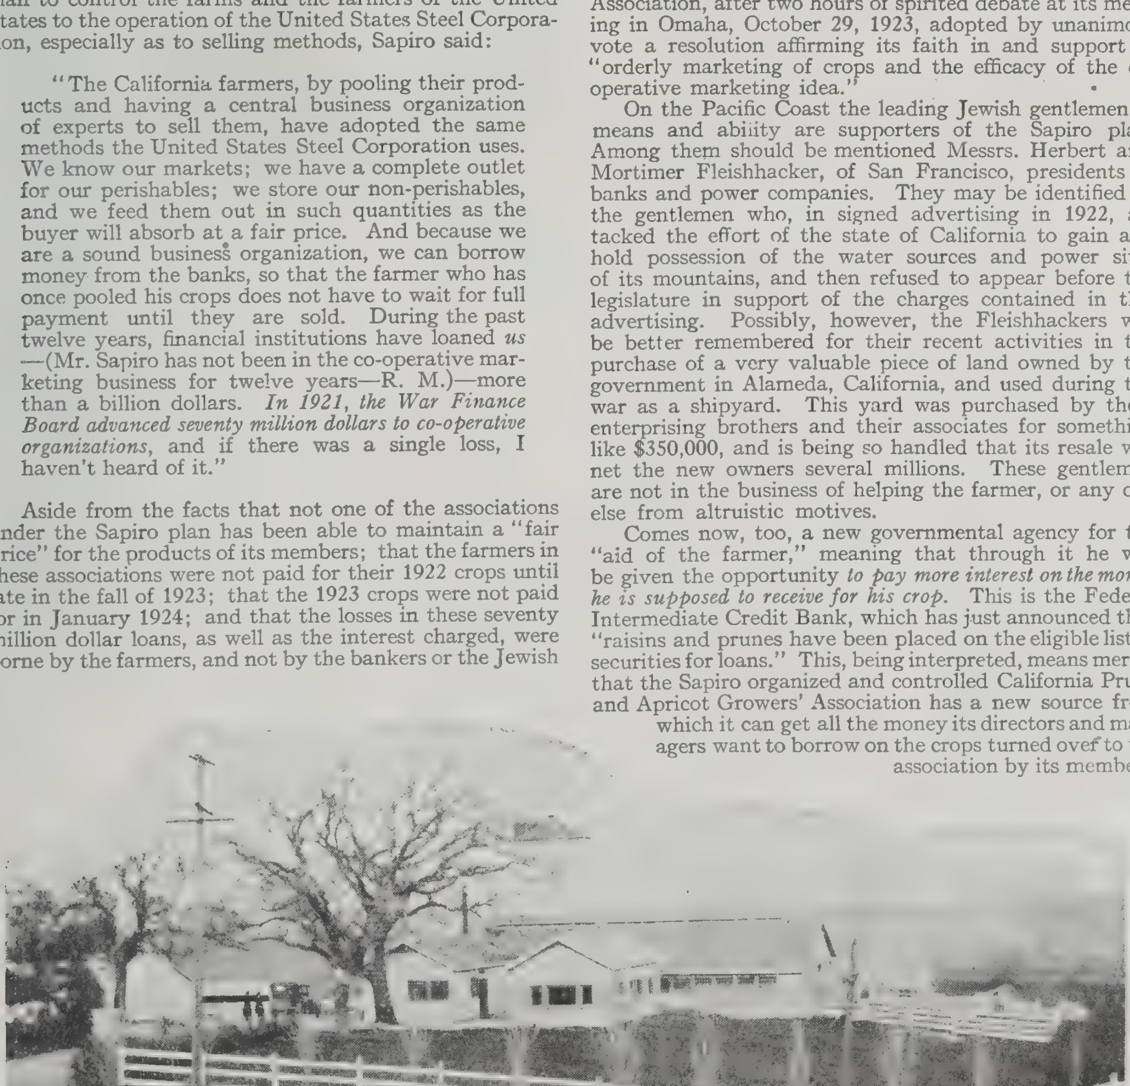
At Washington, in October, it was announced that Managing Director Meyer, and Director Mondell, of the War Finance Corporation, on October 9, telegraphed to the President of the United States:

> "We feel that the meeting with the leaders of the co-operative marketing movement in Chicago indicates a most auspicious outlook for successful results in organizing wheat producers, with the assurance of important benefits to them as well as to the entire country."

The agricultural commission of the American Bankers' Association, after two hours of spirited debate at its meeting in Omaha, October 29, 1923, adopted by unanimous vote a resolution affirming its faith in and support of "orderly marketing of crops and the efficacy of the co-operative marketing idea."

On the Pacific Coast the leading Jewish gentlemen of means and ability are supporters of the Sapiro plan. Among them should be mentioned Messrs. Herbert and Mortimer Fleishhacker, of San Francisco, presidents of banks and power companies. They may be identified as the gentlemen who, in signed advertising in 1922, attacked the effort of the state of California to gain and hold possession of the water sources and power sites of its mountains, and then refused to appear before the legislature in support of the charges contained in this advertising. Possibly, however, the Fleishhackers will be better remembered for their recent activities in the purchase of a very valuable piece of land owned by the government in Alameda, California, and used during the war as a shipyard. This yard was purchased by these enterprising brothers and their associates for something like $350,000, and is being so handled that its resale will net the new owners several millions. These gentlemen are not in the business of helping the farmer, or any one else from altruistic motives.

Comes now, too, a new governmental agency for the "aid of the farmer," meaning that through it he will be given the opportunity *to pay more interest on the money he is supposed to receive for his crop*. This is the Federal Intermediate Credit Bank, which has just announced that "raisins and prunes have been placed on the eligible list as securities for loans." This, being interpreted, means merely that the Sapiro organized and controlled California Prune and Apricot Growers' Association has a new source from which it can get all the money its directors and managers want to borrow on the crops turned over to the association by its members.



Typical American dairy, one of thousands which are being "organized" to pay tribute to the promoters of the Sapiro plan of co-operative association marketing, which is by no means limited to the products of the farm and orchard. Dairymen who have entered these new associations have not prospered any more than those who remained outside, but have had to pay for a great deal of excess cost of operation.

Aaron Sapiro's brother—a member of the law firm.

It would be unfair to the remainder of the ring of Jewish promoters and financiers who are today exploiting the American farmer not to mention at least one more, the able S. G. Rubinow, close associate of Aaron Sapiro, and at present his headquarters lieutenant in the organization of the potato growers of the nation. Mr. Rubinow lacks the intensity of which Mr. Sapiro boasts, but he has proved himself no less able in the overturning of already operating co-operative marketing associations and the substitution of Jew controlled and directed organizations therefor.

Lasker, Baruch, Weinstock, Sapiro, Honig, Levy, Steen, Fleishhacker, Rubinow, Kahn, Meyer—all working for the uplift of the American farmer! Does the American farmer never wonder that of all the leaders of this movement for the exploitation of our agriculture not one has ever been a farmer? Does the American farmer never pause to ask himself why his only "friends" should be an interlocking group of Jews? Does he ask himself why there is not an American farmer in this ring? Mr. Aaron Sapiro is rated by the financial authorities of San Francisco as "able to cash in one million dollars on a week's notice." This means that the million or more dollars this young attorney has made is *not invested in farms* but in easily salable securities. How many American farmers have made one million dollars in five years, or in twenty-five years, or in fifty years? Not one dollar of the money of any of the Jews in San Francisco who are interested in the Sapiro plan is invested in farms, orchards, agricultural lands or agricultural industries.

From one side of the United States to the other, the banks, and certain governmental agencies, about whose control very much could be said, are graciously condescending to lend money to the farmer, on the best security in the world, backed by the best and hardest labor in the world, and guaranteed by the most honest, and, possibly for that reason, the most easily deceived, class of people in the world. Why should the farmer pay interest on money honestly due him for his crop, after that crop has been delivered to the co-operative association? Why should the farmers support from three to a dozen high-salaried executives, and pay tribute to a band of bankers, attorneys, and other "experts" to help him dispose of a crop for which he is receiving no better net return than he received when he sold it himself? There never was a day in the history of agriculture in these United States when the middleman, the oft-reviled go-between from the producer to the consumer, looted the American farmer on such a stupendous scale as he is now being looted.

These are things for the farmer to think about before it is too late, and a large number of the farmers who are now tied up with these new co-operative marketing associations wish most devoutly that they had thought about them before they signed on the dotted line.

One cannot but feel amazement at the territorial extent which this movement has attained, started in reality less than six years ago by a young, unknown and uninfluential attorney on the Pacific Coast. It is true that, in its movement eastward, the Sapiro plan has left disaster in its wake, but it has been disaster to the farmer alone, not to Mr. Sapiro, Mr. Kahn, Mr. Fleishhacker, Mr. Lasker, or any other of the altruistic gentlemen who saw the necessity of uplifting and improving the farmer, and, without thought of anything but profit to themselves, stepped valiantly into the opportunity. In the South, the Sapiro plan holds cotton and tobacco, and virtually all the "improving" of the planters has been done there since 1919. In the great Mississippi Valley and westward to the Rockies, it is gaining rapidly through state organizations of producers of everything from grain to live stock. In the great mountain zone of the West, little effort has been made to "uplift" the farmer or fruit grower, not because the agriculturist does not need it, but because the farmers in that region are not numerous enough, and are too widely scattered through long distances, to make it profitable for their latest exploiters to "work them over." On the Pacific Coast, the Sapiro plan has been or is being locked around the necks of many of the agricultural industries, though those which have made the greatest successes are those which are operated by the agriculturists themselves, without the aid of an "organizing legal counsellor."

In a succeeding paper, Mr. Morgan will tell of the disasters which have followed the application of the Sapiro plan to the agricultural and horticultural industries of the Pacific Coast, where it originated.

Uncle Sam's Newest Naval Training Station

Will Accommodate 20,000 Men Who Will Be Trained for Better American Citizens as Well as Better Sailors

By HARRY H. DUNN

WHAT is said to be the largest and best-equipped naval training station in the world is being completed by the United States at San Diego, California. Already there are pouring into it from 150 to 200 young Americans, recruits to the sea and air service of this nation, from all states west of the Mississippi River, from Alaska, Hawaii and the Philippine Islands. Eventually this western outpost of American sea power will accommodate 20,000 men; today there are between 2,000 and 3,000 in it, with the number increasing every day.

Few careers in this world are so fascinating to the average American boy as life on the sea, and the manner in which, in times of peace, these boys, grown to young manhood, flock to Uncle Sam's newest and best school for sea-fighters, proves that the lure of adventure has not passed with the coming of the age of commerce.

The new naval training station comprises a group of twenty-one buildings, set on 225 acres of land along the shore of smiling San Diego Bay. It is less than two miles from the station pier to the open sea, yet the station itself is perfectly protected by the abrupt earth buttresses of the Point Loma Hills. The station represents, to date, an expenditure of $3,500,000 and $2,000,000 more is being spent to complete the plant to meet the original plan of training all naval recruits from the western half of the United States and the islands of the Pacific.

Here recruits to the navy are given basic primary instruction in seamanship, and later special instruction in that branch of the service which each selects when he enlists. Here, too, are collected the naval training staffs and equipment formerly located at Mare Island and at Goat Island, on San Francisco Bay. The station is commanded by Captain David Foote Sellers, a distinguished officer of the American Navy, whose career dates from the Spanish-American War, and who, at the time of his transfer to direction of the San Diego station, was in command of the super-dreadnought *Maryland*. Henceforth, this station is to be the center of all naval training activities in the West. When plans for this station were formulated, the naval authorities set about securing a site which would accommodate at least 20,000 recruits at the same time. Due to its small size, Goat Island, in San Francisco Bay, could not accommodate any such number. At Mare Island there was a technical school where enlisted men were given advanced training in electricity, machinery and radio, the prime reason for location of this school at Mare Island being that there was a navy yard where actual repairs to large fighting ships were made, and which offered the opportunity for practical technical instruction.

When the destroyer base was established at San Diego, however, practical means of training were opened there and the departments previously maintained at both Goat and Mare Islands were transferred to the Southern California port, so that the entire training school, both primary and advanced, might be kept intact. This great naval training school is now beginning to function—"getting under weigh," as the naval officer says—and its operations, along with the great aviation station, also at San Diego, are worthy of the attention of every American who is interested in his country and its westward advancement.

The training station at San Diego is primarily intended for the basic training of recruits. The 150 to 200 arriving there weekly get an intensive training for eight weeks, after which they are sent to more advanced schools or to deep-sea duty. Although the personnel is constantly shifting, there are always from 2,000 to 3,000 recruits at this newest station.

From November 1 to April 1, a special school is conducted for applicants from the enlisted men of the Pacific fleet, who aspire to enter the United States Naval Academy at Annapolis. The law orders that 100 enlisted men from the navy may enter the academy each year, and the examination given at the end of this period of special training for entrance to Annapolis is purely on academic subjects, such as geometry, algebra, trigonometry, English and history. There is an average of seventy men in the class each year, and five officers are detailed as instructors. Those who do not pass the examinations, or for some reason or other do not enter the naval academy, are eligible to take their places as able seamen aboard the ships of the fleet, after their eight weeks' training, so that the school really serves two purposes.

It is interesting to note that the rejections at the naval training station average only six per cent of the men received, and five of this six per cent are rejected because of physical disability, or ineptitude for the discipline or work involved. Only one per cent is rejected because of bad character or bad conduct. This is a high testimonial to the character of the American boys who apply for admission to the navy. On the day that a recruit arrives at the San Diego station, the chaplain forwards a letter to the boy's mother, or next of kin, advising this relative that the young man has enlisted in the navy, and giving his correct address. In this letter the chaplain offers his services to the man and to his family. When the recruit has completed his preliminary training and is being sent to another station, he is given a stamped post card, which he fills out and sends home, apprising his family of his change of station and new address. Thus, contact with the "home folks" is maintained as long as the man is in the service.

Each week, one man is selected as having the best all-around record for the preceding week and is declared to be "honor man." The navy in the training stations tries to care for the spiritual, mental and physical welfare of the men, surrounding them with good influences and providing congenial, healthful work. As a result of this, the duties of the officers in charge of the naval training stations are by no means confined to the mere teaching of routine navy work and practice to the recruit. He is given a training which makes him not only a good sailor, but a better citizen, and a stronger American when his term of enlistment expires.

At San Diego, too, is located the largest combined army and navy aviation field in the United States. It is on North Island, just across the harbor from the city of San Diego, and its history is one of the most interesting chapters in the record of the armed services of this country. On May 15, 1846, Governor Pico, of California, granted North Island and what is now Coronado to Don Pedro Carillo, who sold the entire property less than a year later to Bezer Simmons for $1,000 in cash. Forty years later, the Coronado Beach Company purchased this entire tract for $100,000. In 1919, or thirty-three years later, the Coronado Beach Company sold North Island alone, consisting of 1,475 acres, to the United States Government for $6,098,333.33, or sixty times the sum paid for both Coronado and North Island in 1886.

It is not the purpose of the writer to explain the reason under which the government paid more than $4,000 an acre for barren land, without improvements, but doubtless there are hundreds of thousands of taxpayers in the United States who would be interested in such information.

North Island was connected with Coronado, the mainland, by a bridge. In 1910, Glenn Curtiss had established a civilian flying school there, under a three-year permit, without charge. There, Curtiss trained a number of army flyers who afterward attained prominence in the World War, among them Major H. H. Arnold, present commander of the army flying field on North Island. In November, 1912, the United States Army established its own flying field on North Island, and at the outbreak of the war with the Central Powers, plans were set on foot to establish a large aviation school at North Island. Many cadets were trained here and sent immediately overseas. In 1917, primary training was discontinued, and Rockwell Field was converted into a pursuit and aerial gunnery school. Young flyers who had finished their preliminary training and received their commissions at other fields in the United States were sent to Rockwell Field for an advanced course of eight weeks, and immediately on the completion of that training sent overseas, completely trained for service over the lines of battle. Of the three classes of pilots—pursuit, bombing and reconnaissance—the first was the most coveted by all the candidates.

Thus, when the Armistice was signed on November 11, 1918, Rockwell Field presented to the world the last word in modern machines, machine shops, planes and equipment. Practically every type of pursuit and bombing plane was available, and several captured German fokkers also were in the yards. Celebrating the signing of the Armistice, 213 airplanes were sent into the air at one time, flying in various formations over San Diego. Every one of these machines returned to the ground without mishap to pilot or plane. This is the largest flight ever held at one time in the United States. Rockwell Field claims the record for turning out more finished flyers in a shorter time than any other aviation training school in the country. Men who had never before flown were taught to fly and

(Concluded on page 10)

Mr. Ford's Page

FARMERS who think are well aware by now how foolish it is to look for help except from themselves. The cure for the ills of farming is to be found within farming, not elsewhere. This is a valuable piece of knowledge to have, because it will save farming from some of the greater disasters that have befallen other fields of labor.

The common error everywhere has been to look to the financial field for the cure of whatever distress there is. This has grown to be a habit in the world, but it is gradually being brought into question, because there is no magic in money to supply a lack of experience or judgment. Railway problems are problems in railroading, not in banking, and all the bank loans in the world will not produce railroad wisdom. Yet what has been commoner in our country than to see railroads bow to Money, as if that could take the place of Management?

This pitiable mistake is at the back of Europe's failure to make a better showing than it does. Materially, Europe is just about what it was. The processes of Nature have been continuous, natural resources are as ready to hand, all the elements necessary to production are present, and yet because of a habitual reliance on money as the main requisite for production, there is no production to speak of. People talk about loans as if loans had magic, as if indeed they ever reached farther than the banking class. The belief that the earth was flat and if one traveled too far he would fall off, the superstition that demons caused eclipses, were no heavier burdens on the human mind, no stronger hindrances to human progress, than is the superstition that it is money that accomplishes things.

Farmers are being handed this superstition in large quantities just now. One would think that the farmer plowed with money, sowed money in his furrows, cultivated with money and harvested money, to hear some of the counsel being given him. There have been proposals of loans, to sink him farther in debt. There have been proposals of great funds to fight off the parasites that jeopardize his crops. Not to mention those who tell him that the problem of farming is marketing, which is not a problem of farming at all but of merchandising. Insofar as a farmer is a merchant, buying and selling, purchase problems and merchandising problems are legitimately his to consider and wisely act upon. But they are not the central problems of farming, by which we mean the working of the land for grain, fruit, vegetable or dairy products. The central problem of farming is the care, cultivation and collection of the fruit of the land.

WHEN you talk about Clean Farms there are farmers who will think that you are only a zealot for neatness. They will think that it is just the "looks" of the farm that interests you. Point them to a well-kept, prosperous farm and they will say, "That man made money and can afford to keep his farm in good shape." This kind of reasoning puts the cart before the horse. It would be nearer the truth to say, "This man kept his farm in good shape and therefore made money out of it." It is more important to keep a farm clean than it is to keep a factory clean, and every factory manager knows that a dirty, disorderly factory spells loss. Clean farming is an essential element of profitable farming.

How can any number of financial or merchandising plans make up for a lack of agricultural ability? So it stands to reason that the first problem of the farmer is farming.

While the fundamental principles of agriculture remain always the same, methods and management are constantly improving. Even the periods of distress through which farmers have passed have contributed to their progress. Failures in one crop have influenced the movement to a diversity of crops, so that the farmer's whole fortune need not always be in one basket. The overproduction of wheat is directly responsible for the increased attention that is now being given to the dairy side of the business. The "great freeze" in Florida many years ago was directly responsible for Florida farmers discovering the large possibilities in garden farming in that state, and anyone who has seen the vegetable farms of Florida and the matchless systems of irrigation which exist in some sections cannot but feel that though the early loss was heavy, the resultant gain has made it worth while a thousand times over. Wise Florida farmers who have seen the agriculture of that state grow to its present proportions are the first to admit this. The boll weevil, disastrous as its invasion of the cotton country has been, will also leave an unforeseen advantage in its wake. And—still speaking of the South—the influx of Negroes to the northern industrial centers will have the effect of replacing slower methods of human labor with modern methods of power-farming; the shortage of men will make an opening through which farmers will see the advantages and profits of the machine.

But, regardless of these problems, there is one matter which should receive more and more attention everywhere, and that is better methods of Farm Management. Farming is both a profession and a business, an art and a science. Haphazard practices, blind following of the old ways, grow less profitable year by year. We are no longer in the rich, lush periods of virgin soils, where fields merely tickled laugh in overflowing harvests. The farmer is adding to his duties that of Manager. It is the man who looks at his business as a whole and is constantly on the alert to apply right principles that finds himself unaffected by the troubles which overtake his fellows in the same line of business.

It seems simple enough to say it, and far too simple for many farmers to take it seriously, but a fundamental principle to follow is that of a Clean Farm. Successful industrial managers know the value of the clean factory, but there are still too many farmers who have not given enough thought to the Clean Farm. Cleanliness of the ground is much more important than of a factory, because the ground is living and because many of the farmer's most troublesome enemies arise from the neglected corners of his land. A well-kept farm should provide no covert for the propagation of parasites. There should be no hole or corner for insect or plant thieves of the farmer's labor. The ill-kept farm becomes a home and breeding place for the very elements which the farmer cannot permit without loss.

This is not merely a plea for neatness. The trouble has been, perhaps, that too many have viewed it in that light. Men who are naturally neat and orderly have looked after their farms merely to satisfy their instinct for neatness, and in so doing they have reaped other benefits of which it may be they were not aware. Still, it is evident to the ordinary observer that it is the neat farm that is usually the well-to-do farm.

People often reason about such farms this way: "That man has made money and is therefore able to keep his farm looking neat." But is it not possible that they mistake cause and effect in this matter? Is it money, after all, that keeps a farm clean and neat? Is it not rather labor and a respect for cleanliness, a desire for orderliness? It is not money, it is the man, who produces neatness. The truer way to reason is this: "That man kept his farm neat and clean, therefore he made money." Cleanliness is one of the causes of prosperity, not the effect of it. In such matters we must guard against putting the cart before the horse.

Suppose a farmer cannot see this as an argument: is he willing to adopt it as an experiment? Neatness is something he cannot buy, he must create it. What will happen? The spots where farm pests breed will disappear. The sour, festering spots will be made wholesome. The holes where rodents take their heavy toll will be stopped. Implements will be protected against the weather. Buildings will be cared for. Fences will be whole and stout. Lanes will be straight and trimmed. Dead stuff, the home of next year's pests, will be used up. The pleasure of it will build the element of orderly management into the farmer's mind and the practical and profitable effects of it will become apparent in the increased value of his property and products. He will become recognized for what he has become—A Master Farmer.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

New Men

THE sole ray of hope from Washington in recent days has been the deliberate manner in which President Coolidge has ignored professional politics in selecting men to fill the Cabinet vacancies. It does not guarantee success that a man lacks a national reputation, but it may indicate that at least he does not belong to the old gang. One of the illuminating disclosures of the investigations is that it is always the old gang that is involved—the same old hangers-on of both parties, the same old office-seekers, even the same old newspapermen. Government seems to have circulated for the last twenty-five years within a limited circle. There have been no new, copious, purifying drafts made on the American people. The "new blood" which is sought by a change of parties, has not been acquired. New people are not brought into the government by swapping one party for another. The only way by which new drafts of men can be brought in is by the renewal or rejuvenation of the parties from within. "Throw the rascals out," once referred to the opposite party; it would be a good slogan for every party to adopt with regard to itself. If this is what Mr. Coolidge is trying to do, good luck to him! But the practical wisdom of his selection can only be determined by the action of the appointees themselves. It would seem that the new Attorney-General could begin at once to show his mettle.

Swat the Rumor

WHO should be interested just now to deal a blow at American business, or any part of American business? Who interested to see jobless men walking the streets, factories running part time, production decreased?

Somebody must be interested in bringing about this state of things, because somebody is making a business of circulating rumors and falsehoods calculated to create distrust. Within a few days there have been fed to newspapers by so-called financial news agencies invented tales of wholesale layoffs of employes, cancellation of raw material orders, and curtailment of production. In every instance these rumors were absolutely without the slightest color of justification—yet they were invented, they were circulated, and when they were called to account and disproved, they were followed by others equally false, equally calculated to create a fearful state of mind.

Somebody, apparently, wants to start something in this country, for financial or political reasons, and somebody is guilty of a kind of treason to the American welfare which, upon exposure, will merit the penalty of treason.

The public should beware all reports calculated to rouse a spirit of insecurity or foreboding. In the meantime, every effort should be made in every locality to discover just who it is that is interested in trying to put the brakes on American industry at this time.

Business is good, normally and wholesomely good. It is real business, not boom and bluster. There is no natural, normal, economic or political reason why it should not continue good. Which makes the activities of a certain rumor-factory very suspicious.

The Mass Meeting

THE following notes were written by an American and may therefore meet the disfavor of the noisy propaganda now reaching Congress. But, as the newspapers played their customary role and told what an impressive mass meeting was held at Detroit in protest against the United States controlling its own immigration affairs, this unvarnished report may assist honest minds to visualize not only what occurred at Detroit, but what occurs everywhere in similar meetings.

"Half the first floor was filled. None in the gallery. It required an hour's wait beyond time for the meeting, to obtain those. Practically all Russian Jews.

It is significant that all the speakers referred to the bill as a religious discrimination. Remove the professional racial leader and clergymen from this argument, and the rest will not feel bad.

"Rabbi Hirschman spoke for the orthodox wing of Judaism. He sneered at Americanism as a certain type of Jew always does when he lets himself go. This is not, of course, a secret pose: it is increasingly found in Jewish publications in the United States.

"Attorney A. H. Jaffin spoke in Yiddish and got the only real kick of applause from what one rabbi called 'this red blooded American audience.'

War on the Birds

DURING the World War the American powder industry expanded quietly because of the material and labor required in the manufacture of war explosives. But the market for powder has fallen off. Is it to revive this market that a prominent powder company is offering $25,000 in merchandise prizes to the individual or club which at the end of the three-month season has killed the greatest number of crows or other birds or animals designated as "vermin" in the competition prospectus?

We hold no brief for the crow. But when it is said that 87,000 persons, including women and children, have enrolled in this campaign, we foresee an indiscriminate slaughter of innocent song birds.

Crows are wary birds and the old pioneers averred they were able to "smell powder." It takes a trained hunter to get within gunshot of the crow. Too many disappointed hunters will "take a crack at something" regardless of species. Among the birds conspicuously black who will come in for indiscriminate shooting by amateurs who think they are shooting "young crows," will be the American Raven, Purple Grackle, Bronzed Grackle, Rusty Blackbird, Red-winged Blackbird, Purple Martin, Cowbird and Starling. Many will unthinkingly shoot robins, woodpeckers, grosbeaks, bobolinks, mourning doves, thrushes, whippoorwills and numerous other songsters rather than return home empty-handed. The thousands of amateur hunters entering into this contest will cannonade the quiet forests and woodlands, frightening away many valuable species during their nesting season.

This campaign to educate the youth of the land in the practice of cruelty and slaughter of birds is sincerely to be deplored. We trust the destructive features of this contest will arouse such adverse criticism that the effects of the nefarious project will be nullified.

Rooster and Cat

ONCE a tiny mouse took a brief outing for the first time. Under the advice of its mother it kept within quick reach of its home. Returning safely, it told its experiences to the wise parent, something like this:

"Oh, mamma, I had a lovely time. I almost forgot to watch for danger. At last I spied the loveliest animal sunning itself. It was so quiet and innocent, and had such lovely fur, I felt I must go to it and nestle against its side. Just then a great big monster, strutting in the yard, raised its head and shouted so loud I was frightened and ran home. I only wish I had been given time to go to that kind friend."

"My child," said the wise one, "but for the fellow you feared you would not have returned. Your quiet, demure friend was our greatest enemy, a cat, and would have devoured you, while the blatant rowdy was a rooster, of whom you need have no fear. His crowing saved your life."

How well the innocence of some humans is illustrated in this little fable! For instance, denouncing the danger of propaganda, many have only the fear of radicalism in mind, and speak of sound Americanism, seemingly unaware that some of the most insidious and menacing propaganda of the day is that which would maintain conditions that are a positive danger to America.

The radical may be only the boisterous rooster; his grievances have their birth in the wrongs suffered by the masses under institutions fostered by harmful selfishness. It is true that human woe is often exploited by radical demagogues for their own selfish ends, but human woe exists in too large a degree for a civilized country. Given a reign of real equity, with a decrease in human distress, the radical would find his occupation gone.

It is wiser to look out for the demure cat, rather than fear the shining-feathered rooster.

Evolution

TO AN outsider, who has ceased to expect courtesy in certain disputes about "evolution," there is still a faint hope that honesty may prevail. When Professor Stewart P. Sherman, as quoted in a Detroit paper, refers to "evolution" as "the most fruitful scientific theory of modern times," he recognizes the fact by the use of the term *"theory."* But when he denounces those who protest that a *"theory"* should not be taught to children as a *Fact,* known and proved, and speaks of "60,000 benighted Bible students" as the enemies of intellectual light, he is simply falling into the casual scientific lie which has so darkly befogged the whole question. When the best informed pro-evolutionists say that the theory is not proved, that confirmation on at least two sides of the theory is less than it was thought to be twenty-five years ago, that what the people have been taught to understand by "evolution" is not at all what scientists now understand by it, there certainly is room for a protest against defenseless school children being taught as a *fact* what is not known to be a fact, while at the same time all other accounts of man's appearance on the earth—the Bible's, for instance—are not permitted to be taught. If Genesis is "religion," and therefore forbidden, where does an opposite theory (admittedly a theory) cease to be irreligion and become science? There is a question of honor as well as logic involved and it is regrettable that enlightened scientists should leave themselves in a position to be challenged by "benighted Bible students."

Comments on the Investigation

LET the investigators be on guard against Cabinet advice about inquiring into "delicate matters." Let the people's business be done in the sight and hearing of the people. If Japan worked a game against our airplane preparations, let it be known. No Secretary of State has the right to say it should not be made known. If a foreign government was behind Sinclair in gobbling up our naval oil reserves, let that government be named, and the details of its game exposed. There are no matters more "delicate" to the American people than the matter of integrity among their public officials, and the Investigating Committee will add the last straw of unbearable treachery if it should fail in its duty or "play the game" as that phrase is understood at Washington.

Pressure is being brought on newspapers to soft-pedal the investigation or slide it over as a comic issue. The country's best humorous writers are being sent to Washington to wind up the exposures with a laugh. This is a course which only desperation could pursue and wholly ignores the impression that has been made on Mr. John Citizen of Forty-Nine States. The reaction which "laughing it off" is causing among people in all parts of the country is not a nice thing to feel. One of the dangerous elements in the present situation is the inability of publicists to feel the public pulse.

What penalty, what punishment for officials who have sold out their sacred public trust? You will not find the people at large talking much about punishment. They don't know of any that fits high crimes. What can be done to a man who has sold his soul, anyway? Here and there throughout the country are military cemeteries, where row on row, in regimental circles and in long lines reaching through woods and running across little hills, are the tens of thousands of white headstones marking the graves of soldiers slain in war. Mostly boys, they were, who believed in America, who paid for America with all they had—to hand America on to us. Confinement to the bounds of a military cemetery, to contemplate by day and night the cost of the country they betrayed—this might prove a suitable punishment for soft-palmed men, weak-charactered men who made of public office a private graft.

The moral slump that has characterized Washington is difficult to understand except at a distance. One example. Everywhere a man's home or a man's office is considered inviolate, but it was with the utmost aplomb that government agents told how they "went through" Senator LaFollette's office and desk, and shadowed other respectable citizens for the personal satisfaction of their enemies. Breaking into rooms and desks and mail, appropriating or destroying papers, is a method that cannot be practiced by any government upon its citizens without bad results. A government has no right to do anything that would be punishable when done by a private detective agency. And—the Investigating Committee should carefully note this—*private detective methods have too shamelessly marked official methods at Washington since the last Presidential inauguration.*

First Impressions of the Picturesque Orient

Leis of Hawaii, Fujiyama the Sacred Mountain, Chinese Bandits

By MRS. L. M. CRAMER

"TAKE four piecee man and one piecee missie to Hotel Astor and make chop chop."

It was dark when we docked at the port of Shanghai, and the ordeal at the customs house had been particularly exasperating.

So this was China where a human was "one piecee." For years I had dreamed of going to China, but I had expected to remain a human being; not become a garment.

In our party were five "griffins" and myself, the mother of one of them. A "griffin" is a young man who is being sent out to the Far East as a representative of a British or American firm. He remains a "griffin" for one year. Four had been sent to North China, and one was to leave us at Japan.

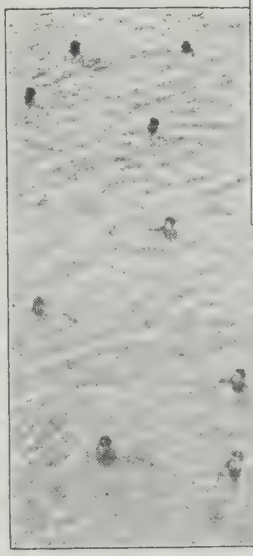
What a trip it had been! Six days out from the Golden Gate—or was it five or seven? We had lost all track of days—we awakened to see, way off in the distance, something that looked like a low-lying cloud, which gradually took on more tangibility and a mountainous shape. The Hawaiian group was an actuality!

The Hawaiian Islands rise out of the deep blue of the tropic waters into a cloud-flecked tropic sky. Their approach is quite entrancing. Color runs riot. The rocks and mountains are covered with tropical growth in a multiplicity of colorings, and the red soil of the islands lends tone to the wide range of greens and heather shades that greet the eye. Little rivulets of sparkling water, cascading down the mountains, reflect myriads of rainbows as the sun shines on them.

In the long ago, in the time of native splendor on the islands, kings and queens of Hawaii maintained their summer palaces on the beach of Waikiki, which is now a world's playground. There, amid the seductive murmurings of palm trees, they relaxed and rested from their cares of state. But gone are the kings and queens, and gone is the native splendor of their day.

The native does not approve of this change. Deep down in every Hawaiian heart today there is seething resentment of the presence of the white man to whom the glory of a bygone day appeals only as a comic opera setting; a resentment toward a pale-faced race which refuses to treat the superstitions, traditions and customs of the islands with respect. It is a resentment, poorly concealed, against the white man who very openly holds the native in contempt.

Half an hour before the boat docked at Honolulu, all about the ship black heads began to bob. They were the heads of Hawaiian boys who swim out to every incoming ship, to dive for the small pieces of silver tourists toss overboard, and stay to watch it turn and flash in the sun, until some native boy has secured it and tucked it away inside his cheek, much as the Maine chipmunk tucks nuts away in its cheek pouches. By the time the boat had docked some of these boys had their two cheeks so full of silver that they had great difficulty in closing their mouths sufficiently firmly to keep the coins safe.



Native boys swimming about the ship at Honolulu.

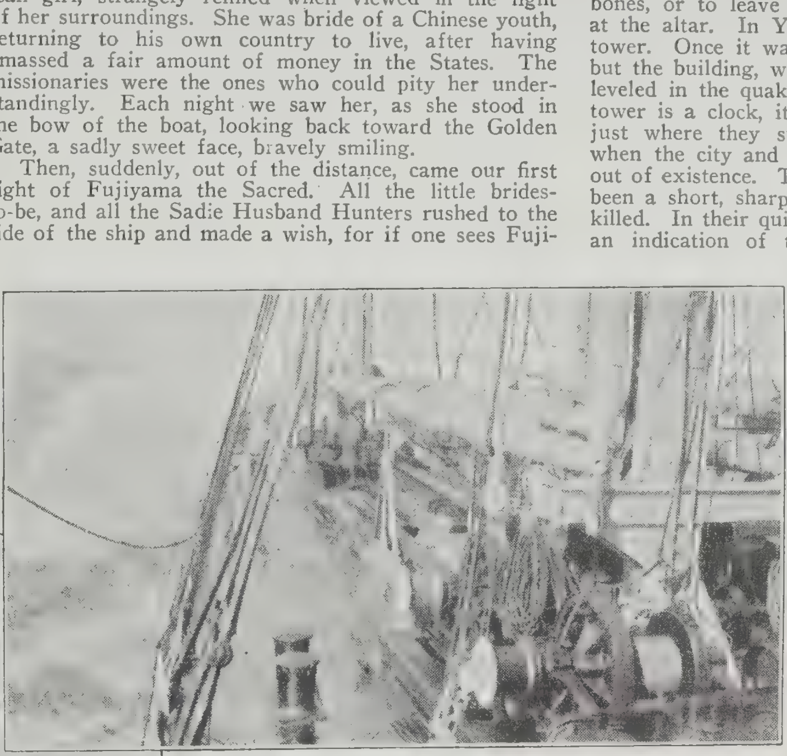
Flower vendors swarm the boat as soon as it docks, and the visitor met by friends, or the traveler returned to his home, will find himself almost strangled by wreath after wreath of sweet-smelling flowers that are thrown about his neck. This wreath is the native leis, sometimes made of fancy colored tissue paper, more often, however, of sweet perfumed native flowers. It is a pretty custom. Just a bit wistfully, perhaps, I stood on one side and watched this most charming custom of welcoming friends, and suddenly, about my throat, I felt something very sweet and spicy and cold, and I, too, was wearing a leis. One of the "griffins," thinking tenderly perhaps of his own mother back in California, had slipped away from the crowd and secured this wreath of soft yellow and white ginger flowers, strung alternately with little deep orange flowers, to make a leis. It was a pretty compliment, a gracious act, and made me feel that I "belonged."

There is a purely American superstition that to toss one's leis on the water as one sails away from the islands, will insure one's return, provided the wreath drifts back to the shore. Here again the foreigner insults the tradition of the native people, for the Hawaiian never casts his leis away. It was given him by a friend and he will treasure it always. It is a small thing, in our eyes, but resentment is deep in the heart of the native-born, who looks with ill-concealed displeasure upon the once beautiful wreaths, grown sodden and ugly, that drift back to shore after each departing boat.

On the boat were the usual number of "navy widows" on their way to the Orient to meet husbands stationed in Far East waters for a period of years. There was also a dear little blond girl, en route to Manila, to meet the man she was to marry, whom she had not seen for three years. Three years sometimes make a sorry change in a young man who has lived alone in the Orient, but the China *Press* of December seventh carried a dispatch from Manila, announcing the marriage, on the day before, of the little blond girl and her man. She had found him worthy.

Others on board our ship were wealthy people touring the world. American business women, going to the Orient for positions, where the salaries are high and the expenses divided in half, counting on the American gold standard. There were missionaries returning to old fields, or new ones going into they knew not what, with the light of high resolve in their eyes. And there were the usual lot of Sadie Husband Hunters, lured on to possible conquests by the stories of the numbers of young unmarried men, on high salaries, living in the Far East, waiting to be plucked.

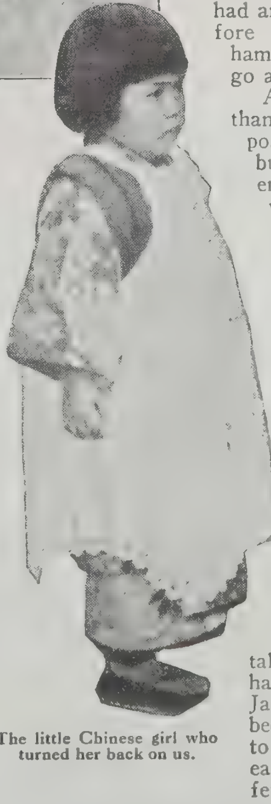
Turbaned Indians from the East, squatting in the steerage, held themselves dignified and aloof from the other steerage passengers. To one side a group of Chinese were playing fan-tan. They were in rags for the most part, but they had money and won and lost it without the flicker of an eyelash. Considerable sums of money changed hands over that game, down in the steerage, and once, looking over the railing "abaft" of which no first-class passenger might go, I saw the oldest Chinese of them all count out $350 and pay it over, without a change of expression. In the steerage, looking quite out of place, was a rather pretty American girl, strangely refined when viewed in the light of her surroundings. She was bride of a Chinese youth, returning to his own country to live, after having amassed a fair amount of money in the States. The missionaries were the ones who could pity her understandingly. Each night we saw her, as she stood in the bow of the boat, looking back toward the Golden Gate, a sadly sweet face, bravely smiling.



Spray dashing over the boat in mid-Pacific.

Then, suddenly, out of the distance, came our first sight of Fujiyama the Sacred. All the little brides-to-be, and all the Sadie Husband Hunters rushed to the side of the ship and made a wish, for if one sees Fujiyama for the first time when the sun shines on it, and makes a wish, that wish will never, never fail to come true.

The next morning was cold and raw and misty, and the mist changed to a driving rain before noon. Late the night before we had anchored out in the bay, before the stricken city, Yokohama, but were not allowed to go ashore till morning.



The little Chinese girl who turned her back on us.

Anything more desolate than Yokohama would be impossible to picture. Not a building stands intact in the entire city, which but a few weeks before had been called the happiest city in all Japan. Leveled to piles of broken brick and sodden dust was its gayest and happiest street—the theater street. Leveled to piles of broken brick and sodden brick dust was every street in the city, and the stench of old bones and old flesh was everywhere. In pouring rain we went on to Tokio, where eager workmen were reducing all signs of a terrible tragedy as rapidly as it was humanly possible. There is some talk of not rebuilding Yokohama as the great port of Japan and hence there has been no such feverish haste to remove all signs of the earthquake. In Yokohama a few streets had little stores of rough framework, stores in which were only the necessities of life, and they were of the roughest and most temporary structure. In Tokio it was different.

Honolulu street scene.

In Tokio a shrine had been erected in a great square, which had been the site of a great factory building. When the building was destroyed by the quake, 35,000 were seeking refuge there and the fire broke out and smothered all to death who had not been killed by the quake. At the shrine, day and night, priests chant their prayers, over the high piles of bones, and tourists, attracted by the chanting, stop and buy flowers to strew upon those piles of bones, or to leave at the altar. In Yokohama there stands a high clock tower. Once it was a part of a great office building, but the building, with the exception of the tower, was leveled in the quake. High up toward the top of the tower is a clock, its hands pointing to the noon hour, just where they stopped that bright September day, when the city and thousands of its people were wiped out of existence. The day before we arrived, there had been a short, sharp shock, and three persons had been killed. In their quick movements we suspected we saw an indication of the strain under which the native people were living, but their immobile faces showed no hint of worry, and the changeless smile of Japan was seen on every hand.

On the ship coming over were two American girls. Both had held high salaried positions with an American firm having an office in Yokohama. Though their building had been demolished by the earthquake, they had escaped without injury.

Their firm got them onto one of the first of the rescue ships bound for the United States. They bade goodby to Japan for all time, but after a week at home they became restless. They longed for the Orient, for Japan. Their firm had established offices in Kobe, and the young women returned on the U. S. S. *President Taft*, sailing out from San Francisco November 8, two months and a week after living through the great earthquake tragedy. That rainy day in Yokohama I went with one of these young women as she started out to try to find the place she had called her home for three years. These two girls, with another American girl and their amahs and servants, had occupied an apartment up on the bluff, the most desirable foreign residence section of the city.

Through miles of debris she and I plodded, over slippery, muddy roads where rickshaw men would not go, and at last she found the place. By a bit of broken china pitcher which had been hers and which she found in the debris, she recognized the site. A pile of charred bones in a little wooden box stood where she believed the entrance of the home to have been. A pathetic little sign, written in Japanese characters, told that these bones had been found in the wreckage of the building. Could anyone identify them? Miss G. thought presumably they were the bones of her amah, for they had never been able to find what had become of her, though the other servants had been found, either dead or living. Pushing away bricks and wood where once the garden had been, she found a few red roses and white gardenias, which she picked and reverently laid on the pile of charred bones that rested in the little wooden box beside what was once the entrance to her home.

That night it cleared and a Japanese moon, a great red ball of fire, came out; across its surface sped fleeting clouds, black in the night.

The surprise of the tourist, visiting Shanghai for the first time, is the initial glimpse he gets of the sky line of that city. It is not unlike that of New York City or of any other American port city. You say to yourself: "This is not so bad. This is like some American city," but then you hear some one at your elbow order a Chinese chauffeur to take "Four piecee man and one piecee missie to Astor Hotel House and make chop chop" (hurry up) and the dream is dispelled.

There are other things to shatter that dream—among them the odors of the street, the ragged rickshaw men, the beggars sore and covered with filth as they wave a shattered arm at you, or with a grin show the stump of a leg, a big asset in the profession of begging. Everywhere there is filth. But Shanghai's shops are marvelous, bewildering and fascinating.

The native city of Shanghai has all the interest of a Chinese city of a generation that has passed. But one

(*Concluded on page 14*)

The American Truth and Alien Free Speech

Is the Goose Step Altogether Fatal; Is a Quinine Diet to Be Forced Upon Us by Those Whose Truth Is Not Our Truth?

By LOUIS WORTHINGTON SMITH

THAT lover of turmoil, animosities and publicity, Upton Sinclair, brought the question of free speech to the front page a short time ago. His attack upon the management of universities and colleges as being ready to suppress truth in obedience to the mandates of wealth, individual or corporate, malicious or stupid, is as violent as that of any clamoring voice well can be.

Ideally, no doubt, free speech, whether of the tongue or of the printed page, is part of the irreducible minimum of liberty essential to a democracy. Milton's plea for unlicensed printing, the *Areopagitica,* has seemed unanswerable. More than that, it has so much become a part of our common thought that we can hardly look upon it as a thing debatable. It is to be remembered, however, that in Milton's day truth was static, not dynamic; absolute, not relative; objective, not subjective. Out of the conflict of opinions truth would only the more surely emerge, as Milton thought, and that was because truth for him was one thing.

When this American commonwealth of ours was given a constitution, it was not realized in its implications that the world of social order that man creates for himself is not the world of nature into which he is born. Truth was a something absolute to our forefathers, as to Milton, and nature was only incidentally part of the whole of truth. The more men were free to talk about it, the more likely they were to find it. In the world of the natural and physical sciences, now as then, nothing could be truer. For the student of the material world outside of man, animate and inanimate, the goose step is beyond all question utterly fatal.

Is it reasonable to pass from this conclusion to the further conclusion that in a society organized by man for the fulfilment of his aims and purposes the goose step is equally disastrous? The Upton Sinclairs all say yes, and all the lovers of chaos add their voices to the chorus. Others who are not lovers of chaos can be discovered beating time to the music, but it is at least a ground for suspicion that the high-pitched instruments are in the hands of the anarchic.

Striking a Happy Medium

THE great problem of man in society has for a great part of his recorded history been that of securing order and organization without becoming bound to formalism and ritual. Inescapably, order and organization are in some degree associated with the maintenance of a ritual. Any action that is not to be destructive of order and subversive of the organization within which it is operative, must be in agreement with a formula. If that formula is as hard and fast as the goose step, life certainly becomes more or less pallid and meaningless. On the other hand, life without a formula is life in the jungle. There are those who enjoy the jungle, who belong in the jungle, but when that can be said of the majority of Americans, when that has become the inner truth of American life, America as we have understood it will have ceased to be.

The Cat and the Tiger

THE jungle theory of existence is rooted in the belief that man is a part of external nature, that he lives according to the laws of external nature, and that the old notion of his superiority to nature is a myth. This theory and the doctrine of free speech have come to have an affinity that could hardly have been dreamed of before science had increasingly drawn men to look at and study the world outside themselves. Free speech, carried to its logical end, gives to the advocate of the jungle the privilege of imposing the jungle and the methods of the jungle upon those who have fought their way out of the jungle and have no overpowering primitive instincts to force them along the way back. It is out of the wisdom of the race that its social formula has been evolved. No social organization, no social code, has been discovered in nature. Society as organized is not objective. It is not founded on objective reality or objective truth. It is a human construction, and it is usually so far local that it reflects not the truth of humanity at large, but the truth of a racial portion of humanity. Organized society is the instrumentality by which man realizes his inner nature and gives it external actuality.

Illustratively, it is more than probable that Muscovite truth and Turkish truth can never become Anglo-Celtic truth. The brotherhood of man is a beautiful conception, but the sentimentalists have not yet demonstrated it as a real unity of the race. The cat and the tiger are one in their kind, perhaps almost as much one as the Hollander and the Marquesan; but the truth of existence for the cat is a warm fire and a place on the rug by my lady's chair, while the truth of existence for the tiger is the jungle. The growing encroachment of the world of the cat upon the world of the tiger does not change the tiger's habits to those of the cat. It exterminates him. It is reported also that the introduction of the beauties of civilization into the Marquesas Islands does not make a civilized man out of the Marquesan. He suffers extermination with the tiger.

It is for the securing of his own happiness in agreement with the demands of his own nature, as exhibited in the racial mass, that man has established a social system. No man can be persuaded that he is happy by way of the palate on a diet of quinine when he craves grapefruit and buttered toast. No amount of discussion will make the life that produces happiness for the Marquesan produce happiness for us. Neither will an American arrive at happiness by such roads as guides may point out to travelers in the Balkans. It is worse than useless to discuss that possibility. If the Persian or the Abyssinian crowds upon us and asserts his truth in our midst, he may seduce some of our degenerates and disturb our life, but he cannot change what is truth for us. He cannot give us his nature in place of our own.

In the face of these considerations, the argument for free speech and a free press loses something of its look of finality. In a world in which truth is one thing, the discussion that brings truth to light should certainly contribute to agreement and understanding. In a world in which truth is two things or three things or even more, in a world of subjective truth, including a variety of differing race tendencies, it may chiefly bring to light truths whose differences are irreconcilable. If discussion only makes it more certain that my neighbor and I can never agree, perhaps one of us should be suppressed before our antagonism has become too pronounced. Which one of us should receive the adverse judgment must be wholly a matter of location. If I am in the other man's world and am trying to make him take my good and beauty in place of what is and always will be good and beauty to him, I am the one to be given a sedative. I can justify my suppression of his truth, whether by force or by open discussion, when I am in his world, only by conquering him by making him a part of my world and insisting upon his accepting the consequences. In such cases the question is not one of abstract theory, but of preponderant force maintaining its own social ideals.

Choking the Super-Vociferous

IT SEEMS more than probable that, with the coming upon us of many additions to our already large alien population, we shall have to reconsider the problem of freedom of speech. Our truth is not the truth of a great number of those who cross the water to our shores, and it is a grave question whether the various bodies of truth to which we separately hold can ever be brought into harmonious union. If race qualities are as permanent as there is abundant reason for believing them to be, they will always remain apart. In that case freedom of speech is little more than a piece of sentimental benevolence by which we may surrender our truth to those not of our household and be compelled thereafter to eat the crumbs of unpalatable bread from their tables. A decent self-respect should suggest that, before we come to that state, some measures of self-preservation may properly be taken, even though they do compel the super-vociferous to choke a little now and then on their words.

Uncle Sam's Newest Naval Training Station

Concluded from page 6

received their "wings" as trained pilots in thirty days, and solo flights were made when the cadet had received less than three hours' instruction. At other fields seven or eight months often were required to give the same amount of training that was given at Rockwell Field in thirty days, the reason being the absence of rain or cloudy days at the San Diego field.

There are a number of other interesting features of Uncle Sam's naval department now developing at this newest and largest station. The destroyer repair base, which is of the most vital importance to the maintenance and operation of the destroyer force on the Pacific Ocean, is located there, and is one of the best-equipped plants of its kind in the world. The base covers 115 acres and includes in its repair units a 2,500-ton marine railway. This base keeps in condition not only the destroyers in active service, but maintains as well the condition of the eighty-two decommissioned destroyers tied up there.

The fleet supply depot, occupying, with the headquarters of the Eleventh Naval District, a seven-story building on the waterfront, handles all the supplies for the shore stations throughout the district, amounting to more than $2,000,000 monthly. The high-power radio station of the navy is located on Chollas Heights, overlooking San Diego, and the more than one hundred warships of various kinds which, on the average, are in the harbor every day in the year. Some idea of the value of this newest and largest naval station to the port in which it is located may be gained from the fact that the pay roll met by Uncle Sam there every month is more than $2,000,000.

ONE OF THE IMPORTANT results of the bringing together in one naval training station of all the recruits from the United States and its possessions west of the Mississippi River is the collection of information regarding the education, religious beliefs, ages and family relationships of the men who enlist, giving a cross-section of these conditions in the general young manhood of America. The following tables are the result of the tabulation of the first 3,000 men entering the San Diego station for training:

1st. Thous.	2nd. Thous.	3rd. Thous.	RELIGIOUS DATA
474	457	303	men profess Protestant church preference but not membership.
365	385	519	men stated they were member of Protestant churches.
134	123	140	men stated they were Catholics.
6	10	10	men gave their church preference as Catholic.
16	14	16	men stated they were Mormons.
7	5	5	men were of the Jewish Faith.
5	4	0	men belonged to the Christian Science church.
3	2	7	men declared they had no religion or religious training.
			AGE DATA
°57	58	64	men are below 18 years of age.
°354	346	336	men are 18 years old.
189	191	187	men are 19 years old.
105	108	100	men are 20 years old.
137	143	112	men are 21 years old.
68	68	80	men are 22 years old.
37	38	43	men are 23 years old.
20	14	26	men are 24 years old.
33	34	52	men are 25 years old, or older.

°NOTE—This is a tabulation of original statements. Later admissions and reports move many 18 and 17 year old boys down into younger ages.

1st. Thous.	2nd. Thous.	3rd. Thous.	EDUCATIONAL DATA
117	97	91	men have less than 7th grade education.
27	14	4	of the above had only 3rd or 4th grade schooling, or less, and are considered near-illiterates. They have been given instruction in reading, writing and arithmetic.
116	134	123	men finished 7th year in grammar school.
295	312	340	men finished 8th year in grammar school.
143	149	133	men had one year in high school.
144	133	128	men had two years in high school.
86	84	83	men had three years in high school.
76	71	73	men had graduated from high school.
23	20	29	men had graduated from high school and had taken more or less advanced schooling after that.
			HOME DATA
153	171	127	men reported having no living parents.
400	340	380	men reported coming from broken homes, or having only one living parent.
447	489	493	men reported having both parents living not separated or divorced.

A naval hospital, designed ultimately to accommodate 1,000 patients, also is located at the San Diego post, though at present there are wards for only 250 beds. The group of buildings in this hospital cost $2,300,000. The barracks of the United States Marine Corps, standing on a campus of 732 acres, is considered the finest brigade post in the United States, which is to say, in the world. The government has expended to date approximately $3,500,000 on this unit, which consists of six barracks, each 319 by 42 feet, with dormitory wings 66 by 41 feet, and a kitchen wing 43 by 41 feet. The connecting arcades between these buildings and in front of them form a covered portal more than half a mile long.

Each of these barracks has accommodations for 200 men, with individual mess halls and kitchens. The buildings are designed in the Spanish renaissance style of architecture, and the idea has been carried out in great detail. When completed, this Marine Corps post will contain forty-five buildings, placed in a rectangle, and extending along a 3,000-foot front, facing San Diego Bay. The buildings are grouped within an area of fifty acres, the remaining 682 acres of the tract being set aside for parade grounds, baseball diamond, tennis and handball courts and flower gardens. Major Joseph H. Pendleton is in command of the brigade of Marines, and Lieutenant Colonel Giles Bishop is in command of the Marine Post. Captain Albert Marshall, U. S. N., commands the Aircraft Squadron of the Battle Fleet, and Lieutenant B. H. Wyatt is flag lieutenant of the same squadrons.

Our Wonder of the World—the Great Salt Lake

Longer and Wider Than the Dead Sea But Not So Briny

By E. J. DAVID

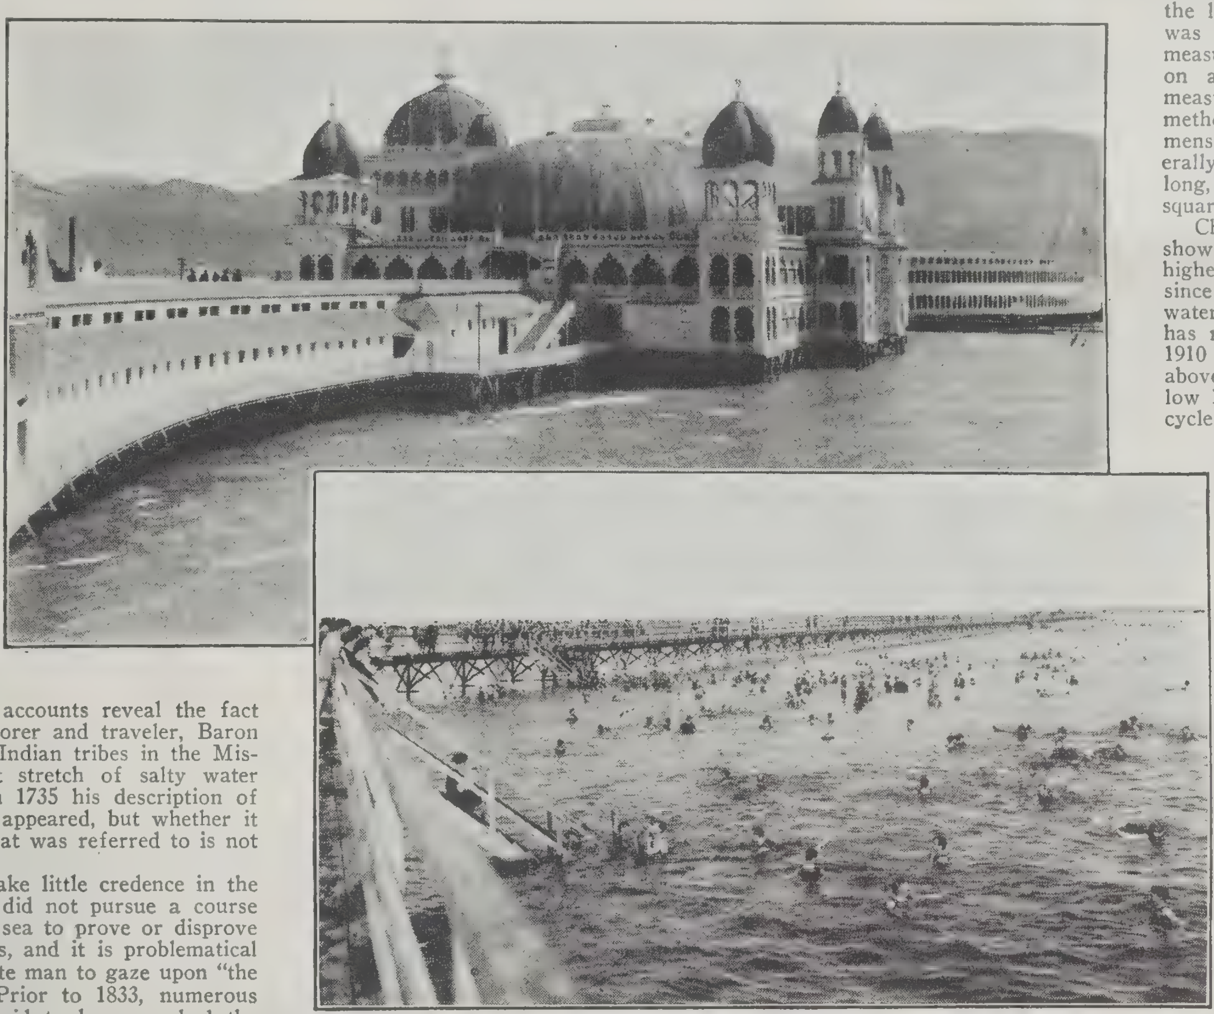
AT SALT LAKE CITY'S doorstep is situated a wonder of the world—the Great Salt Lake—of which people know little. The lake is a great inland sea with no outlet from the lake except by evaporation. It is, of course, heavily impregnated with salt.

To such an extent does the salt prevail that it is impossible for a person to sink. This, however, does not mean that the water is absolutely devoid of danger. On the contrary, the uninitiated might not swim or float properly and as a result would tip at an angle which would cause considerable suffering if the salty water entered the lungs. However, most of those who venture into the water, and there are many thousands every year, obtain the proper advice to avoid any discomfort.

The Great Salt Lake has been an object of attraction to the student and the layman alike; and its claim upon the popular notice has increased with the passing years.

The first reliable information regarding the discovery of the lake dates back to 1776, when Padre Escalante, a Spanish official and explorer, followed the Provo River from its upper parts to its termination in Utah Lake, situated in a valley directly south of the Great Salt Lake. Earlier accounts reveal the fact that a certain French explorer and traveler, Baron La Hontan, learned from Indian tribes in the Mississippi Valley of a great stretch of salty water lying to the westward. In 1735 his description of what the natives told him appeared, but whether it was the Great Salt Lake that was referred to is not known.

Escalante appeared to take little credence in the stories of the natives and did not pursue a course into the basin of the salty sea to prove or disprove the accounts of the Indians, and it is problematical as to who was the first white man to gaze upon "the Dead Sea of America." Prior to 1833, numerous traders and trappers are said to have reached the shores of the lake, but in that year Benjamin L. E. Bonneville gazed upon the inland sea without question. He wrote much of it in a descriptive manner and many attempts have been made to have the lake named after him, but the name, the Great Salt Lake, was far too popular. Captain James Bridger is said to have followed the Bear River to its mouth and sallied forth in a boat on the lake, but authoritative confirmation is lacking. Then, again, in 1843, ten years after Bonneville made his expedition, John C. Fremont, brevet captain in the United States Army, out West on government work, traversed the lake by rowboat and made the first reliable record of its physical features.



Above—The pavilion on Salt Lake, amusement center and gathering place for thousands who journey to the lake to "cool off." Below—A summer afternoon in the Great Salt Lake showing the large number who take advantage of a dip in the briny.

The Great Salt Lake today lies on the valley floor, bounded on the west by Boxelder and Tooele counties' waste and desert lands, on the north by another part of Boxelder County, on the east by the hilly Davis and Weber counties, and on the south by Salt Lake and Tooele counties. The lake is twenty-eight miles longer than the Dead Sea in Palestine, forty-one miles wider, and covers six to seven times as much area. Only in depth and in saltiness does the historical Biblical sea surpass the mountain-girded sea of Utah. The water of the Dead Sea is twenty-seven per cent salt, while the Great Salt Lake varies from 13.7 per cent to 22 per cent. In depth the Dead Sea measures in places 1,300 feet, but the most striking feature of the hydrography of the Great Salt Lake is its shallowness. The mean depth is thirteen feet and the maximum depth of forty-nine feet has been compiled, and even when the water increases from ten to twelve feet in level, the depth of the water does not keep pace correspondingly, but spreads.

Due to the varying amount of precipitation, humidity and water used for irrigation, the lake is always inconstant in its volume, and consequently such action causes many fluctuations in the area of the lake. At one time when it was at its lowest level its area measured 1,750 square miles, and on another occasion the lake measured 2,170 square miles. For methods of convenience, the dimensions of the lake are generally settled at seventy-five miles long, fifty miles wide and 2,125 square miles in area.

Charts of the lake levels show the water at present to be higher than in any previous year since 1891. In that year the water equaled the height that it has now attained and again in 1910 it ran close. It is eight feet above what it was during the low level mark in 1903. A wet cycle prevailed from 1865 until 1886, during which time the lake was continually high, and reached its climax in 1886, when it struck the 13-foot mark above zero. From then until 1903 a dry cycle prevailed, and in the latter year the lake reached its lowest mark in written history. A game of baseball was played west of the present pavilion at Saltair, which is now on the fringe of the lake and the foundation of which is now submerged a few feet. Incidentally, bathers had to walk more than a mile to get into satisfactory bathing water, compared to the conditions existing today.

During the year of its lowest mark the precipitation in Utah was 14.80 inches, while the precipitation during the highest mark registered 18.42. The range of the lake is 16 inches during the season and it reaches its highest mark in the latter part of May or June. The rise occupies seven months, due to the melting snows, spring waters and occasional rise of precipitation. The fall takes about five months during the summer when water escapes very rapidly by means of evaporation. In autumn the evaporation diminishes and in November it barely manages to hold its own.

Promontory Point, pointing like a pistol into the heart of the lake from the north, appears to be the remnant of the range of mountains which at one time took in Antelope Island, directly west of Davis County, and Fremont Island and protruded through to the Oquirrh Range. Antelope Island is the largest of the land masses arising in the lake. The other islands, in order of size, are Stansbury, Fremont, Carrington, Gunnison, Dolphin, Mud, Hat and Bird and Strongs Knob.

In the early days, Stansbury and Antelope islands were accessible by fording and were used as herding grounds. Later, however, with the rise of water, boats had to be brought into action to make the crossing.

The Great Salt Lake receives its water supply from the creeks and rivers running from the Wasatch and Uinta ranges. From the western shore, which is bounded by the Great American Desert, there are no streams which yield water for lake consumption. The first river of importance that feeds the lake is the Jordan, which brings down the overflow from Utah Lake and dumps it in the lake a few miles southwest of Woods Cross; next to the Jordan in point of importance are the Bear and Weber rivers, the former running in from the north and the latter draining the eastern hills. Besides these main contributories, numerous small streams, known as creeks, render considerable water in the early spring melting season. It is recorded that the streams carry enough calcium to charge the lake for 18 years.

The solids brought down in solution by the inflowing streams have been progressively accumulating, while water itself has been removed by evaporation at a rate equal to, and for long periods greater than, the supply. Much of the soluble matter is left in the lake and abandoned and becomes a layer of the dregs.

The lake itself was probably formed by the distortion of the earth's crust.

There appear to be but two forms of life that can survive, brine shrimp and larva of the fly.

The pavilion was completed in 1893. At the time it was nearly a mile from shore, the railway leading on a pile-supported track into the lake.

America Deficient in Long-Distance Runners

Concluded from page 2

fied. But the same charge may be made against some of the leading universities.

One of the best illustrations of overburdening the high-school athlete may be found in the case of Sherman Landers. In 1916 Landers competed in the Stagg Interscholastic Meet. He ran in the 100-yard and 220-yard dash events, in the 120-yard high hurdles and the 220-yard low hurdles, the 440-yard run, the pole vault, the broad jump and the javelin throw, a total of eight events. In the two-dash and the two-hurdle races he was forced to run heats as well as the finals. It was the keenest of scholastic competition. Landers scored twenty-six points in the meet and after running in the heats and in the finals and doing the pole vault, the broad jump and the javelin throw, Landers had the pole vault standards set at thirteen feet at the close of the meet and tried to clear that distance and set a new record.

Landers did not do this only in the Stagg meet at Chicago, but he repeated the performances in the meets sponsored by the University of Michigan, the Bradley Polytechnic Institute, and the University of Minnesota. In addition, he was subjected to the same abuse in several smaller meets. Landers was the outstanding athletic performer, winning these meets single-handed. Then, as soon as school ended, Landers joined the Chicago Athletic Association, kept in training all summer and competed in all meets. He was, of course, the most desired prospect in the country and Pennsylvania finally landed him. But there he was never the pole vaulter that he had shown himself to be in high school and he was only a fair broad jumper. By virtue of some skill in the hop, step and jump, he managed to make the Olympic team. According to his feats as a high school athlete he should have been the star of the Olympic Games at Antwerp in 1920 but all that Landers managed to do was to fail absolutely. He did not have enough ability to finish among the first three in the one event that remained for him, the hop, step and jump.
